rise from the springing to the top being 27 feet; and as
it was thought necessary to keep the roadway as low as pos-
sible, the side ribs are made to go up as high as the rail-
ing; they are connected with the ribs by the covering
plates, by means of pieces of iron dovetailed in the
ends of rings-polls. The plates which compose the covering
over the lower ribs, are cast with deep flanges; they are
laid close to each other, and form an arch of themselves.
These side ribs, or arches, would have added much more to
the strength of the bridge than they now do, had the mate-
rials been of a substance that would not expand or contract;
but that not being the case, they, in warm weather, when
they expand, rather tend to derange the other parts of the
bridge than strengthen it; and the appearance of the whole
is by no means pleasing.

About the same time that the bridge at Buildwars was
erected, an iron bridge was thrown over the river Teme in
Herefordshire. Its parts were so slender and ill-disposed,
that no sooner was the wooden centre taken away than the
whole tumbled into the river.

The splendid example of the bridge at Wearmouth gave
an impulse to public taste, and caused an emulation among
artists, which has produced many examples and more pro-
jects of iron bridges. The Coalbrook Dale Company have
constructed several, among which is a very neat one over the
river Parrot at Bridgewater. Mr. Willson, the engineer,
employed by Mr. Burdon, has also built several, and has
lately finished a very elegant one over the river Thames,
at Staines, which is by far the most complete in design, as well
as the bell executed, of any that has hitherto been erected.
This bridge consists of a single arch, 181 feet in span, and
10 feet 6 inches in rise, being a segment of a circle of
480 feet. The blocks, of which the ribs are composed,
are similar to those in the Wearmouth bridge, except
that there have only two concentric arcs instead of three, as
at the latter. The arcs are call hollow, and the blocks
connected by means of dowels and keys; thus obviating
the great defect observed at Wearmouth, of having too much
hammered iron exposed to the action of the air. Four ribs
form the width of the arch, which are connected together by
cross-frames. The spandrels are filled in with circles, which
support a covering of iron plates an inch thick: on this
is laid the roadway 27 feet wide. Two hundred and fe-
venty tons are the weight of the iron employed in the bridge,
and three hundred and thirty of the roadway.

For further practical details on the construction of bridges,
the reader is referred to the articles Foundations in Water,
Caisson, Cofferdam, &c.

BRIDGES. Theory of. In considering the theory of
bridges, the first object of enquiry is the nature of an arch,
and the principles on which depend its stability and perma-
nence. It will be seen, by referring to the article Arch in
this dictionary, that we have adopted the opinion of those
mathematicians who conceive that an arch is kept in equi-
librium, or from falling, by the weight or vertical pre-
ourse of the superincumbent wall or masonry. The principles
on which they proceed, have now obtained the name of the theory
of Equilibration.
It will be readily admitted, by those who attend to these subjects, that whatever properties may be shewn to relate to a geometrical or linear arch, considered without thickness, and of its superincumbent plane, may be easily and safely transferred to a real arch of solid materials: and the heavy matter sustained by it; for it is manifest, that a solid arch may be conceived either to be generated by the motion of a linear arch, and its plane in a direction perpendicular to that plane, or to be made up of an indefinite number of such equal linear arches and corresponding planes; and in either case, what is shewn to obtain with respect to the former, may without hesitation be applied to the latter. This the reader will keep in mind.

The first hint of a principle which we recollect, is contained in Dr. Hooke's assertion, that the figure into which a chain or rope, perfectly flexible, will arrange itself when suspended from two hooks, is, when inverted, the proper form for an arch composed of stones of uniform weight. The reason assigned for this principle is, that when the flexible filoon of heavy bodies becomes inverted, still touching one another in the same places, the force with which they press on each other in this last case, is equal and opposite to the forces with which they draw each other in the case of suspension. The curve formed by a rope, or flexible chain, of extremely small links, when thus suspended, is well known to our geometricians by the name of the catenary curve; by the French it is called la chaine:

If a curve of this kind be disposed in such a manner that its vertex shall be uppermost; and if a multitude of globes be so arranged that their centres shall be in the circumference of this curve, they will all remain motionless and in equilibrium: much more will this equilibrium subsist, if, instead of globes, we substitute this voutoirs, having flat sides, which touch each other in directions perpendicular to the curve. In the former case, the equilibrium will be destroyed very easily, just as a globe resting on a plane surface is easily put into motion; in the latter, the equilibrium cannot be destroyed without considerable force, just as when a heavy body is placed upright on a broad flat base, it will not only stand, but will require considerable force to push it over.

Since the catenary curve is readily described mechanically, it is no wonder that this principle of Dr. Hooke's should be very generally received; but many of those who adopted it, forgot that it could not be extensively applied, without certain modifications: these modifications, it will be seen farther on, cause this principle to coincide exactly with the true theory of equilibrium. As to the contrary, it is manifest, from what we have already said, that it is only the form of a very slender arch rib of uniform thickness, and unfit for the purpose of a bridge; which requires a considerable mass of masonry to be upon the arch and fill up the space to the roadway, thus completely destroying the equilibrium at first established in the arch itself. It would be possible, indeed, to construct a catenary curve of equilibrium, having a horizontal line for the extrados, but then the thickness of the mass above the crown of the arch must be enormous; thus, for a catenarian of 100 feet in span, and 40 feet high, the distance from the top of the arch to the horizontal extrados must have been nearly 37 feet to ensure an equilibrium. For these reasons the catenary curve has been very seldom used in the erection of bridges.

Another principle, which was first assumed about the end of the 17th century, is, that every perpendicular column of masonry above the arch is merely kept from sliding down the arch by the next adjoining column. It is very obvious, at first sight, that this principle is not confident with nature; it has therefore found but few advocates. When analytical expressions are deduced for the curvature of arches constructed on this principle, it is worth observing, that they coincide exactly with those which would flow from the supposition that the arch was in equilibrio, in consequence of having a fluid, with a horizontal surface, preying upon every part of it.

A third principle is drawn from the consideration of the arch stones being fruits, or parts of wedges. This principle, we believe, originated in France, and has been preferred in various forms by De l'Abbé, Belidor, Varignon, Parent, and other French philosophers, and lately by our ingenious countryman Mr. Atwood.

In the method now alluded to, it is considered what weight, in or upon a wedge, is balanced by forces acting against the sides; or what force such a wedge exerts both horizontally and perpendicularly to its sides; and thence it is computed what must be the position and shape of the contiguous wedges of given weights; or what must be their weights to a given shape and position, so as just to exert the adequate degree of resistance required by the first wedge; and so on, from wedge to wedge, till the whole is balanced. A mere wedge constructed in this way, would remain in equilibrio as long as the constituent vousoirs had liberty to slide, without friction, down the respective inclined planes on which they lay. This method is, indeed, liable to many objections. First, this theory requires, that either the density or the magnitude of the respective vousoirs, from the crown to the foot of the arch, should keep constantly increasing in proportion to the differences of the tangents of the several angles, while the joints of the vousoirs make up the vertex axis of the curve. Now, if the architect would wish to change the density of his materials in the required proportion, we know not what materials he could use; for the density must always be very great towards the spring of the arch; and, in many cases, it must be infinitely great. If, on the other hand, the magnitudes of the vousoirs were gradually increased, it would be necessary that those at the spring, and consequently the abutments, should be immensely great, and often infinite; besides, that the wedges must be cut to different oblique angles, very difficult in execution, and totally unsafe when erected as the acute angles would be in constant danger of flushing off. Here too, in real practice, there would be a total want of balance, on account of the masts of masonry and rubble work, which fills the space between the arch and the road-way. But even this is not all; the arch stones cannot be made, nor indeed ought they, to act as the true mathematical wedge, the properties of which were employed in attempting to establish the equilibrium. The wedge of these theorems is supposed to have its butting sides perfectly polished, and to have its weight or other force on its back balanced by proper equivalent forces acting perpendicularly against those sides. Now this is so far from being the case in the practice of bridge-building, that architects contrive to have the butting sides of their wedges so rough as to occasion a great deal of friction between them; and to increase the adhesion of these sides the more, they introduce between them the best and sturdest cement they can procure. By these means, so far from the arch stones being kept in their places only by forces perpendicular to their butting sides; and having liberty to slide along those sides, as in the wedge theory, they are absolutely prevented from the possibility of so sliding; and in a great measure kept in their places in the arch, by forces that act even perpendicular to those which the wedge theory requires. On these accounts, then, we conceive that, however specious and plausible this theory may appear on paper, it ought not to be admitted, since it is manifestly inapplicable to any case which can ever occur in real practice.

On the contrary, the theory which we have adopted, or that given
given by Emerson in his fluxions, published in the year 1742, and which has been so ably and judiciously handled by Dr. Hutton in particular, is consistent with nature and with truth. This theory establishes an equilibrium among all the vertical precesses of the whole fabric contained between the loftic, or under-side of the arch, and the road-way over all. It is now very generally adopted by the most skillful engineers and architects, as the only true one; because it ensures a balance in the whole of the points carrying water, by making an equality at every point of the curve, between all the adjacent precesses when reduced to the tangental directions, or perpendicular to the joints, which are supposed to be at right angles to the curve of the arch in every part, as the structure naturally required them to be; for, if the joints be perpendicular to the curve, there will arise a lateral precess, whose direction is not along the tangent; which, wanting a force to sustain it, will destroy the equilibrium, and some of the stones will endeavour to fly out.

When speaking of the principle advanced by Dr. Hook, we observed, that by means of peculiar modifications, it was capable of universal application to cases occurring in practice, and was at the same time consistent with the theory we have assumed. This we shall now proceed to shew. In Pl. XXXVIII. Architecture, fig. 1. is fig. 2. Pl. VI. (referred to in the article Arch.) completely inverted. Let this represent a flexible chord or chain, void of gravity, hanging from the points A and G, which are fixed; at the points B, C, D, E, F, suppose weights to be suspended, (acting in the directions BH, CI, DK, &c.) proportional to the several lines B, C, M, D, Fn, E, and FY. Then the chain now before us will be the complete inversion of that which is first stated in Proc. 1. article Arch., the drawing forces in this instance being respectively equal and opposite to the fissing precesses in that: therefore, every thing proved there, by means of the composition and resolution of forces, will be found to obtain here, only in a contrary direction. Consequently, if the number of weights hanging from the chord ADG be indefinitely increased, it will assume a curvilinear shape, similar in its nature to the arch of equilibrium, only in an inverted position; and the various theorems which relate to the weights and precesses of the falling arch, apply with equal facility and accuracy to the weights hanging from the suspended arch. Whether, therefore, we consider the falling or the hanging arch, it is equally true, that in the case of just equilibrium, the column either precessing or drawing at any point of the arch is reciprocally as the radius of curvature and the cube of the line of the angle, in which the vertical line cuts the curve in that point (Cor. 2. pr. 1. Arch.) or, since the coefficient varies as the fine inversely, the column above-mentioned is reciprocally as the radius of curvature, and directly as the cube of the feant of the curve's inclination to the horizon, in the given point.

But the analogy between the standing and the hanging arch has been traced out, not so much for the purpose of corroborating the true theory of equilibration, as for the sake of deducing from it a very popular and general mode of construction; strictly accurate in its principle, and yet so simple in its application, that the most illiterate artizan may safely practice it. Suppose it were required to ascertain the form of an arch which shall have the span AG (fig. 2. Pl. XXXVIII. Architecture) and the height D 8, and which shall have a road-way of the form BFC above it. Let the outline figure ABEGC be inverted, so as to form a figure A b e c G. Suspend a fine chain of uniform thickness from the points A and G, and of such a length, that its lower point will hang a little below d, corresponding to D. Divide AG into a number of equal parts (the more the better) in the points 1, 2, 3, &c. and draw vertical lines, cutting the chain in the corresponding points 1, 2, 3, &c. Now take pieces of another chain, whose links are easily separated, and hang them on at all the points 1, 2, 3, &c. of the chain A D G: when these pieces of chain, by taking off links at some places, and hanging on at others, till their lower ends all coincide with the inverted road-way B D. The greater lengths hung on in the vicinity of A and G, will pull down those points of the chain, and cause the middle point of, which is left loaded, to rise a little, and bring it near to its proper height. It is obvious this is an arch of equilibration for a bridge to loaded, that the weight of the arch-chains is to that of the superincumbent matter between the arch and road-way, as the weight of the chain A G, is to the sum of the weights of all the little bits of chain, very nearly. But this proportion is not known before-hand; we must, therefore, proceed thus: adapt to the curve produced in this way such a thickness of the arch-chains as may be thought sufficient to enable stability; then compute the weight of the arch-chains, and the weight of the rubbles, or other materials with which the lanacnes are to be filled up to the road-way. If the proportion of these two weights be nearly the same with the proportion of the weights of the chain, we may rest satisfied with the curve thus found: but if it be much different, we may soon find how much should be added to, or taken from, the appended bits of chain, in order to make the two proportions equal. We shall then have a curve infinitely near to the inversion of the curve wanted. This method we can safely recommend, as we know it to have been frequently used with facility and success.

It would draw us far beyond the limits we are obliged to align ourselves, were we to give a complete view of the theory in all its branches: those who are desirous of obtaining a more intimate acquaintance with the subject are, therefore, referred to Dr. Hutton's ingenious treatise on bridges; for our own parts, we must content ourselves with just touching upon a few of the most important particulars. Under the article Arch. and the corresponding plate, we have given figures of the extrados, of a circular and elliptical arch of equilibration; from which it may be seen how far the extrados extends from the vertex of the curve, before it becomes unfit for a road-way by reason of its bending upwards: in this respect, it appears, that the flat elliptics has the advantage of the circular arch; but the cycloidal arch of equilibration, though similar to these, has the advantage of both, because the extrados runs farther on, nearly parallel to the arch before it comes to the point of inflection. We should observe, however, that in many cases, even of circular or elliptical arches, the evil arising from the inflection of the extrados may be thrown off to a greater distance, by a very simple expedient: for, in an arch of equilibration, as SHB, fig. 3. Pl. XXXVIII. of Architecture, whole extrados is EIK SF, since the points at m, n, &c. are kept in equilibrio by the heights of the wall I, K L, &c. that if the lines Lm, Kn, Lc, &c. be divided in a given ratio in i, k, l, &c. the smaller masts, under the new extrados s, i, k, f, s, will still recede the equilibrium. Now it is obvious that this lower extrados runs much farther from the crown than the upper one, before it has a point of inflection: and hence appears one great advantage arising from the use of iron in bridges instead of stone. Suppose, for instance, that an arch was to be constructed, having the span AD, and height CB, and that the necessary thickness of a stone arch at the crown was BS; here it is plain, that if the road-way were made, having a practicable slope as SK a, it would fall far below the required extrados at KIE, and consequently, the arch, for

R 2

want
want of a sufficient weight over the portion $A$ $m$ $n$, and an
equal portion on the other side of the vertex, would be in
constant danger of rising in the haunches. But a bridge
formed of hollow iron voussoirs would be abundantly strong,
with far less thickness over the crown, as $B$ $z$ ; and then
the true extrados $e k j f$ would, in every part, have a proper
slope for a road-way; while, at the same time, the structure
is in no danger of being destroyed for the want of an equili-
brium in all its parts.

We have mentioned under the article Arch, what kind of
arches ought to be preferred in the erection of bridges; and
have shown which are strongest: we may here observe, that
if there be two arches of the same kind, with an equilibrated
load over each of them, the strength of the one will be to
the strength of the other reciprocally, as the radii of curva-
ture at the vertices of the two arches; hence, an elliptical
arch, standing on its shorter axis, will be stronger than a fes-
micircular arch of the same span; and the semicircular arch
of equilibration will be stronger than a flat elliptical arch of
the same span. As to the effect of an additional weight
over any part of an arch, it will vary in proportion of the
horizontal distances from the extremities of the arch. Hence,
the greatest danger arising from an additional weight,
is when it lies over the crown of the arch; for then the
product of the horizontal distances from the abutments is equal
to the square of the semi-span, and is the greatest it can be.

Since in any arch of equilibration, the pressure arising
from the incident weight at any point is reduced to the
direction of the tangent at that point, we have in such an
arch $V B$, fig. 4. Pl. XXXVIII. of Architecture, the weight
of the part $V B E A$, the pressure along the tangent $F B$, and
the horizontal pressure in direction $D B$, respectively as
the lines $F D$, $B F$, and $B D$, or as the corresponding lines in
a triangle, whose sides are severally perpendicular to those in
$B D F$. Hence, it is easy to find the area of the portion
$A E V B$, thus: make $e$ parallel and equal to $C V$, the
radius of curvature at the vertex; and draw $e b$ perpendicular
to the tangent $B F$, meeting $o b$ the perpendicular to $e v$ in
$B$; then in the triangle $e o b$, $e v$ corresponds to $D B$, and
$o b$ to $D F$; and the area of the parallelogram $a v$, having
$e v = V E$, is equal to the area of $A B V E$: in like manner,
by drawing $e g$ perpendicular to $G I$, the tangent at $G$, we
should have the parallelogram $b e$ equal to the portion $H B$
over the part $G B$ of the arch. The area of the space
$H V G E$, between the arch and the road-way, being thus
ascertained, its weight of course becomes known, and,
consequently, its horizontal pressure against the abutment, as at
$G$: for it will be, as the line $e g$ : $o c$ :: the weight over
the semi-arch; the horizontal thrust against the abutment, or a
pier, at $G$.

But in estimating the thrust against the piers, &c, it is
most common to ascertain the position of the centre of gra-

tical line $D F$, passing through the intersection of the tan-
gents $A D$, and $B D$. And the centre of gravity of the
materials $A V K$, between the crown and the abutment, is about
the middle of the vertical line $E c$, passing through the
intersection of the tangents $A D$ and $V I$. If the arch
be part of a circle, $IV$ is the tangent of half the arch $A V$,
which, subtracted from half the span, leaves $A G = \frac{1}{2} AV$—
tangent of half $A V$; and since $G e$ is the line of
arc $A V$—verfle line of arc $e V$, we shall, by adding $e E$ to $G e$, have the altitude of the centre of gravity, from $A C$
the horizontal line. If $A V$ be a parabola, $A G = \frac{1}{2} A C$;
but if it be an equilibrated curve, with a horizontal extra-
dos, then $A G = \sqrt{\frac{1}{2} V H \times CV \times R}$, where $R$ is the radius
of curvature of the arch at the crown. When the arch is
not justly equilibrated, other methods of finding the centre
of gravity of the masts supported must be had recourse to.
See Hutton on bridges, p. 49—56. It may be worth
while, however, to describe here an easy practical method,
accurate enough for most purposes: namely, to draw on a
piece of card paper, a plan of the arch, and its load; then
to cut out half of it as $D A B C$, fig. 6. Pl. XXXVIII. of
Architecture, and to determine experimentally the point $K$
in the piece cut out, on which, when supported, the whole will
rest; for this point will manifestly correspond with the centre
of gravity.

The place of the centre of gravity being determined, we
may now shew how to ascertain the thickness of a pier, ne-
necessary to support a given arch. Let $A B C D$, fig. 6. Pl.
XXXVIII. represent the masts over half the arch; $D E F G$ the
pier. From the centre of gravity $K$ of the masts, draw $K L$
perpendicular to the horizon: then the weight of the arch,
in the direction $K L$, will be to the horizontal push, or lateral
pressure at $A$, in the direction $L A$, as $K L$ to $L A$. For
the weight of the arch in the direction $K L$, the horizontal push
in the direction $L A$, and the oblique push in the direction $K A$,
will be as the three fides $K L$, $L A$, $K A$. So that if $A L$
denote the weight or area of the arch, then

\[
\frac{A L}{K L} = G A \times X G A X A,
\]

its effect on the lever $G A$, to overact the pier, or to turn it
about the point $F$. Again, the weight of the pier will be
as its area $E F \times F G$, and, supposing the load over the arch
and the pier to be of similar materials, $E F \times F G \times G A F$
or $E F \times F G$, is the effect on the lever $G A$ to prevent the pier
from being overact. Here it is supposed, that the length
of the pier, from point to point, is the same as the
thickness of the arch, and that the centre of gravity of the
pier falls in the vertical plane bisecting $F G$. Now, that
the pier and the arch may be in equilibration, the two effects just
stated must be equal; therefore, we have

\[
\frac{1}{2} E F \times F G \times G A F = \frac{1}{2} G A \times \times X G A X A,
\]

from which it follows, that the thickness of the
pier is $G A = \sqrt{E F \times K L \times X A}$.

In the above investigation, it is supposed, that the whole
of the pier is out of water: but if any part of it be im-
mered in water, that part will lose so much of its weight
as is equal to its bulk of water, if the water can get below the
pier or into the joints. This, however, may easily be
brought into the calculation. By applying the above the-
orem to the several cases which may arise, the thicknesses
of the pier may be found, so that it shall just balance the spread
I
or shoot of the arch, independent of any arch on the other side of the pier. But the weight of the pier ought a little to preponderate, or exceed in effect, the shoot of the arch; and, therefore, the thickness ought to be taken a little more than what the theorem will give: indeed, in most cases occurring in practice, the thickness must be between the fifth and the seventh part of the span of the arch.

The only remaining consideration in the theory, relates to the form of the ends of a pier, to afford the least resistance to the force of the stream of water. Now, it may be found by a frictional process, that if the water strike every part of the pier with equal velocity, the end of the pier should be a right-lined triangle, when the force of the water upon it is the least possible: when the varied increased velocity, as in the case of a flooded, is used, the form of the ends comes out a little curved. One third of the absolute force is taken off, by making the ends of the pier semicircular: it would be taken off, if the ends were parabolic; but when the ends are right angled triangles, with the right angles pointed into the stream, the absolute force of the water upon the pier is reduced to one half; and an acute angle pointed into the stream will reduce its force still more. But in rivers, on which heavy craft navigate, and pass the arch, it is generally better to make the ends nearly semicircular: for, although it does not divide the water so well as the triangle, yet it will bear the shock of the vessels better, and, at the same time, be more likely to turn them off towards the middle of the arch.

Bridges, in Gunnery, the two pieces of timber which go between the two trunks of a gun-carriage, on which the bed rests.

Bridges, in the Military art. Flying bridge, pont volant, or pont d’abordans, signifies a bridge constructed of pontoons, leather boats, beams, hollow caissons, sheaves of pulleys, blown bladders, called aegopyres, or the like, laid upon a river, or marshy and boggy ground, and covered over with planks, for the passage of a body of troops.

Flying bridge, pont volant, taken in a more particular signification, denotes a bridge composed of several boats, connected by a flooring of planks, and surrounded by a balustrade or railing. It is furnished with one or more masts, to which is fastened a strong cable, supported at proper distances by boats, and extending to an anchor to which the other end is made fast, in the middle of the water. By this contrivance, the bridge becomes movable, like a pendulum, from one side of the river to the other, without other help than a rudder. Such bridges were formerly sometimes constructed of two stories, for the quicker passage of a great number of men, or that both infantry and cavalry might pass at the same time. The use of this kind of flying bridge is, however, attended with great difficulty and danger, and subject to the most fatal accidents. An unfortunate instance of this occurred at the evacuation of Nimegun in the campaign of 1794, where, while the Dutch garrison were occupied in crossing the river, an unlucky shot from the French batteries carried away the top of the mast, and the bridge swinging round to the enemy’s side of the Waal, above 400 of the garrison were immediately made prisoners. Those who remained in the tower, to a much greater number, were by the means of escapers, rendered to the besiegers.

Another kind of flying, or floating bridge, is formed of two small bridges laid one another in such a manner, as that the uppermost stretches and runs out by the assistance of cords drawn through small pulleys, placed along the sides of the undermost bridge, which is thus pulled forward, till the farther extremity of it rests against the place it was intended to be fixed upon.

When these two bridges are extended to their utmost length, so that the two middle ends meet, they should not be above four or five fathoms long; for if longer, they will break. Their chief use is for surprising out-works, or fortified posts that have but narrow moats. In the memoirs of the Royal Academy of Sciences, we find a new contrivance of a floating bridge, which lays itself on the other side of the river. Vide Hill, Acad. R. Sci. au. 1743, p. 194.

Draw-bridge, or pont abaisseur, is a bridge fastened at one end with hinges, so that the other end may be lifted up or let down by some easy contrivance. The most common method is by a kind of balance called phers (which see); in which case the bridge stands upright, to hinder the passage of a boat, or the like; the breadth of this bridge is usually about nine or ten feet, and its length about fifteen feet. There are others so constructed as to be drawn back, for hindering a passage, and to be thrall over again for affording a passage. Others open in the middle, half turning to one side, and the other half to the other, being joined again at pleasure; but these are subject to an obvious inconvenience, as one half of them remains on the enemy’s side. The marquis de L’Hopital has given the construction of a curve, in which a weight will always be a counterbalance to a draw-bridge; which the younger Bernouilli has shown to be no other than the cycloid. Act. Erud. Lips. an. 1695.

Drawbridges are likewise frequently used on canals, navigable rivers, and wet-docks; for small canals they consist of one leaf or frame only, movable on hinges; but for large canals, such as the Forth and Clyde canal, in Scotland, and for wet-docks, &c. they are made in two pieces which meet in the middle, forming an arch, and are raised or lowered by means of balance frames, movable on the tops of uprights, suited in height to the magnitude of the bridge. Such bridges, however, have been found inconvenient in use, owing to the obstruction they give to the yards and rigging of ships in passing through them. This gave rise to the invention of a different sort of bridge, which, for small canals, consists of one frame or leaf only, turning on a centre or series of balls or rollers, and for large canals, or navigable rivers, they are formed of two parts, which meet in the middle. The first that have come to our knowledge are those at Cherbourg and Toulon. Neither of them, however, are so complete as those that have lately been constructed at the West India and London docks; the latter spans 40 feet, and 15 feet wide in the roadway, and is made of thin ribs of cast iron, about an inch and a half thick, turning on a number of concentric rollers, moving between two circular rings of cast iron, which are very nicely turned, and there is a flap for each leaf, which lets down by a screw, and abuts against the stone work on each side, forming the whole, when shut, into an arch, capable of carrying any weight which can ever pass over it.

The whole, though weighing 8½ tons, moves with great ease, and can be opened and shut in less than three minutes, thereby occasioning very little obstruction to travellers, while vessels pass through the locks.

Bridge of communication, is a bridge made over a river, to preserve a free intercourse between two armies, or fortified places, separated by the stream.

The bridge now most generally employed, and which, by reason of its superior efficacy, has gradually almost superseded the use of all those above-mentioned, is that constructed of copper or wooden boats, fastened with stakes or anchors to the bed of the river, and covered over with planks.
planks. Modern armies generally carry with them a number of these copper boats, or pontoons, that they may always be in readiness for throwing over bridges. Several of these being joined side by side, till they reach across the river, and planks laid over them, make all plain for the troops to march upon.

The most remote ages of antiquity furnish us with many remarkable instances of bridges of this kind. One of the earliest upon record, is that laid by Darius Hyphasis over the Ister, or Danube, in his Scythian expedition, about the year before Christ 528. Herodotus, l. i. c. 98. Darius also crossed the Thracian Bosphorus with 700,000 men by means of a bridge of boats, the flait being five fadias, or 1,008 yards in breadth. That of Xerxes, in the year 480 before Christ, seven fadias wide, or, as some estimate them, nearly a mile in length, across the Hellespont, is still more remarkable. The boat-bridges of Xerxes began at Abydos, and terminated a little below Selinus. This passage, which is the narrowest part of the Ister, is only about 1,752 toises, or 880 yards wide. But, as the length of the bridge is laid to have been seven fadias, M. D'Anville (M. de l'Acad. des Bell. Lettr. t. 28. p. 334.) has from hence inferred, that these fadias were only 51 toises, or 108 yards, each. The first bridge of Xerxes having been carried away by the force of a tempest, he substituted two others, that towards the Pontus Euxinus, consisting of 360 vessels of the largest dimensions used in the ancient navies; the other of 340. These were steadied moored by means of large anchors. Six immense cables, fastened to large pins driven into the opposite shores, extended the whole length of the bridges. Across these were laid trunks of trees, and upon them a flooring, which was covered with earth for the passage of the army. The whole was secured by a railing on each side. This contrivance is the model of most of the bridges of boats which have since been constructed, with this difference, that the vessels of Xerxes were arranged item and item upon the water, a plan exactly contrary to the present method. That the Persians were in the habit of constructing bridges of this kind, appears from these examples, and from another recorded by Xenophon, who mentions that of Sissae over the Tigris, composed of 27 boats. The Greeks and Romans were very expert in this part of the military science. Several bridges of boats are mentioned by Appian, in his account of the civil war. That of Cæsar over the Rhine is familiar to the readers of ancient history; and in all his campaigns, we observe particular attention on the part of that celebrated commander, with regard to the passage of rivers, or preserving communications by means of bridges. In the contest between the armies of Otho and Vitellius about Cremona, a bridge of this kind is noticed by Tacitus. That of Trajan over the Danube has been already mentioned. Where boats were wanting, the ingenuity and cruelty of the ancients found other expedients for overcoming the obstacles presented by the rivers to their progress. Hamilcar Barca, in his war against the mercenary army, crossed the Macræ by means of the following stratagem. He observed that when the west-north-west wind prevailed, the sand it agitated almost choked up the mouth of the river, and formed a kind of natural bridge for the passage of his troops. He availed himself of this discovery to pass the Macræ in the night, and obtain by surprise an easy victory. Saper the Perian, by a refinement in cruelty, made use of the bodies of his prisoners to facilitate the passage of his army. (Vid. Herod. lib. iv. cap. 97, 99—Ibid. lib. vii. cap. 32—36—Xenophon Anab. lib. ii.—Appian, de Bel. Civ.—Cæsar de Bel. Gall. lib. iv.—Tacitus, hist. lib. ii.—Dion Cassius, hist.—Polybius, lib. i.—Trebell. Poll. in Vat. cae.)

Of late years the laying of bridges across rivers has been greatly improved and facilitated. In the campaigns of 1799 and 1800 in particular, this branch of the military science attained that pinnacle of excellence which it will be difficult to surpass. Few objects present more varied details than the crossing a river by open force, and in presence of an enemy. In operations of this kind, localities and other physical circumstances differ infinitely, and give rise to such numerous combinations of advantages or disadvantages, that it is impossible to lay down any given precepts which may be applicable in all cases. What may be very proper and feasible upon one river, or at a certain season of the year, may be impracticable elsewhere, or in any other period. Sometimes the necessaries for the expedition must be transported by water; at others, by land. Rivers which have marshy banks, a smooth bed, an even current, and a muddy bottom, require totally different precautions from those with a rapid and formidable current, which are overlung with thick woods, or have a rocky bottom. The best commentary upon these several cases, will be a detailed account of the operations adopted in them.

The piaffages of the Rhine by the French troops at Urtingen, Neuwied, Kehl, and Dierhagen; at Reichlingen, Atzmooor, and Lucetfliege in Switzerland; those of the Limmat, the Danube, the Lech, the Inn, and finally of the Mineo, will evince the progress lately made in the construction of bridges of pontoons. Two of these have been treated with great precision by an engineer in the French service, whose work well defends the attention of military men in general. (Dedon, relation des piaffages, de la Limmat et du Rhin. Par. 1801, 8vo.)

Under this article of bridges we may also mention portable bridges, easily taken and put together again. M. Couplet mentions one of this kind, 300 feet long, and which 40 men may carry. See Du Hamel. Hist. Roy. Acad. Scienc. i. iii. § 5. c. 4.

Pendant, or hanging bridges, called also philosophical bridges, are those which are not supported by posts or pillars, but hang at large in the air, being sustained only at the two ends or butments. Of such bridges, consisting of a single large arch, instances have been already mentioned. Bridges of this kind are used by the Spaniards for passing the torrents in Peru, over which it would be difficult to throw more solid structures either of stone or timber. Some of these hanging bridges are formed so strong and broad, that loaded mules pass along them. Ulloa, tom. i. 358. Dr. Wallis gives the design of a timber-bridge, 70 feet long, without any pillars, which may be useful in places where pillars cannot be conveniently erected. Phil. Trans. N° 163, p. 714.

Dr. Plott informs us, that there was formerly a large bridge over the canal-ditch at Tisbury in Staffordshire, made of pieces of timber, none much above a yard long, and yet not supported underneath, either with pillars or arch-work, or any other sort of prop whatever.

It has been already mentioned, that the ancient Romans paid particular attention to the construction and repair of bridges; and that in the middle ages the building of bridges was reckoned among the acts of religion. By our ancient laws, pontium repuratio, or the repair of bridges, was part of the trinoda necessitas, to which every man's estate was subjected. However, by the great charter, 9 Hen. III. c. 15. no town nor freeman shall be restrained to make bridges nor banks, but such as of old time, and of right, have been accustomed. And none can be compelled to make new bridges, where none were ever before, otherwise than by act of parliament. 2 Inst. 701. By the common law, some perfons are bound to repair bridges by reason of the tenure of
of their lands or tenements; and some by reason of prescription only. 2 Inft. 700. But if a man make a bridge for the common good of all the subjects, he is not bound to repair it; and if none are obliged by tenure or prescription at common law, then the whole county or franchise shall repair it. 2 Inft. 701. By 22 H. VIII. c. 5. it is enacted, that, as in many places it cannot be known and proved, what hundred, town, parish, person, or body politic, ought to repair bridges broken in the highways; in every such case, the said bridges, if they be without a city or town corporate, shall be made by the inhabitants of the county; if within a city or town corporate, then by the inhabitants of such city or town corporate; or, if part be in one, city, or town corporate, and part in another, or part within the limits of a city or town corporate, and part without the, inhabitants of the town, cities, or towns corporate, shall repair such part as lies within their limits. The decay of bridges are preventible in the least, or torn. 2 Inft. 701. By the above act, the justices, or four of them at the least, shall have power to inquire, and determine in the general felion, of all manner of annoyances of bridges broken in the highways, to the damage of the king's hiege-people, and to make such process and pains upon every pretence against such as ought to be charged to make or amend them, as the king's bench usually doth, or as shall seem by their directions to be necessary and convenient for the speedy amendment of such bridges. Such part of the highways as lies next adjoining to any ends of any bridges within the space of 300 feet, shall be made and repaired as often as necessary; and the justices shall inquire into, and determine annoyances in such highways. By 12 Geo. II. c. 29, no money shall be applied to the repair of bridges, until pretence be made by the grand jury at the assizes or felions, of their insufficiency, inconvenience, or want of reparation. Again, by 1 Ann. R. 1 c. 18, no fine, fine, penalty, or forfeiture, upon any pretence or indictment for not repairing bridges, or the highways at the ends of them, shall be returned into the exchequer, but shall be paid to the treasurer, to be applied towards the said repairs, and not otherwise: and no pretence or indictment for not repairing bridges, or highways at the ends of bridges, shall be removed by "certiorari" out of the county into another court. The charges of repairing and amending bridges, and highways at the ends of them, shall be paid out of the general county rate. 12 Geo. II. c. 29. The four justices in felion may appoint two surveyors, with salaries, to see the bridges amended. 22 H. VIII. c. 5. This business of surveying bridges is usually annexed by the justices to the office of the high constables, with the allowance of salaries. The stat. 14 Geo. II. c. 33, gives justices the power of changing the situation of bridges, as it enables them to purchase lands adjoining any county bridge, for the more commodious enlarging, and convenient rebuilding the same. By 12 Geo. II. c. 29, justices, at their general or quarter felions, after pretence made by the grand jury of bridges wanting reparation, may contract for rebuilding and repairing the same, for any term not exceeding seven years, at a certain annual sum. They shall give public notice of their intention to contract, make contracts at the most reasonable prices, and take security of the contractors for due performance.

If a man has toll for men or cattle passing over a bridge, he is to repair it. And toll may be paid in these cafes by prescription or statute.

By many special statutes, enacted upon the occasion, it is made felony to destroy bridges, &c. erected by virtue of these acts of parliament.

Bridge-masters, are officers of the city of London, chosen by the citizens, who have certain fees and profits belonging to their office, and the care of London bridge, &c.

Bridge, in Masonry, a small wooden machine for stringing to reef on, in tuning violins, tenors, bases, guitars, monochords, &c. In this last the bridges are moveable.

BRIDGENEND, in Geography, a town of Glamorganshire, in South Wales, situated on the banks of the river Ogmore, over which is a stone bridge, dividing the town into two parts. One of these is called Bridgend, and the other Newcaflle. The latter, being feated on high ground, commands some very fine and extensive prospects. There is another part of the town called Oldcastle, by way of distinction from the former, each of which was formerly protected by a castle, and some remains of both are still standing. At Oldcastle is a chapel of ease under Coity, that being the mother-church; and at Newcaflle is a large well-built parifh church. The river Ogmore abounds with salmon, trout, eftin, and various other fish, with which the markets are generally well supplied. The foil round Bridgend is fertile and well cultivated; and the town is also in a state of considerable improvement. The agricultural society of the county has established a woollen manufactory in this town, and supplied it with different machines. About two miles east is the village of Coity, where are the remains of a very large and venerable castle, which, next to Caerphilly, was the largest in South Wales. Bridgend has a good weekly market on Saturdays, and two fairs annually. It is 20 miles from Cardiff, 181 W. from London; contains 1683 houses, and 7140 inhabitants. Malkin's Tour in South Wales, 410. 1804.

BRIDGENDIRTH, a large ancient borough town of Shropshire, England, is built on the top and declivities of a hill, which rises steeply from the river Severn. It covers a considerable extent of ground; many of the streets are narrow, and some alleys which lead from the river, conftitute of long flights of steps. Bridgenorth appears to have obtained some confluence as early as the time of Ethelreda, wife of king Ethelred; and was fortified and furnished with a castle by Robert de Belfeme, or Beliamse, son of Roger de Montgomerie, in the time of Henry I. Collecting a few associates, he here made a stand against the forces of that monarch, but, being vanquished, was obliged to fly into Normandy; where, according to Speed, he continued to "blow those embers that others had kindled." The castle at this place appears to have been of great extent and importance, and was mostly occupied by the Normans during their wars against the Welsh. In the reign of Richard II. it was committed to the custody of Hugh de Burrell, a favourite of that monarch, whose remains were interred at Hales Owen church in this county. In the civil wars, this castle was the scene of a violent struggle between the forces of the king and those of the parliament. It was then much battered; and one of the towers which now leans about ten degrees out of the perpendicular, was then partly undermined. The singular position of this building very much resembles one at Pisa in Italy, and is often contemplated with wonder by the passing traveller. Part of the site of the castle is occupied by a large handsome new church, and at the other end of the town is an ancient church which suffered much in its ornaments, painted glass, &c. in the above wars.

Bridgenorth is separated into two parts, divided by the Severn, and respectively called from their relative situations, upper and lower town. The hill on which the former stands rises almost perpendicularly from the river, and conffits mostly of solid rock, in which many cellars are excavated.

This borough had several privileges granted it by charters from
from Henry II. and king John; and returned members to parliament ab origine. It is governed by two burgesses, annually elected out of twenty-four aldermen; and the right of election is vested in the burgesses and freemen within and without the borough, amounting to about 700. There are a large well-supplied weekly market on Saturdays, and three annual fairs. The town contains 945 houses, and 4308 inhabitants, 3805 of whom are employed in the manufactures and trade of the place.

David Caldwell died at Bridgend in November 1765, at the advanced age of 107 years. He was born in the army in the first of Ayr, Scotland, and served as a drummer in King William's army, and many years a soldier under queen Anne. He perfectly retained his faculties to the last. Camden's Britannia. Magna Britannia. History of the Burghs of Great Britain.

BRIDGES, James, in Biography, published, in 1751, a well known work on the subject of farriery, in which he appears to have been well versed, with the following quaint title: "No Foot, no Horfe; or, an Effay on the Anatomy of the Foot of a Horfe. With particular Directions for the Cure of the chief Internal Difficulies the Horfe is liable to." With plates, 8vo. London. Haller. Bib. Anat.

BRIDGET, St. in Heraldry, an order of knighthood instituted in Sweden in 1366. They were to oppose hereby, secure the confines of the kingdom, bury the dead, feed the widows and fatherless children, and to keep up hospitality. Their emblem was a cross of eight points, four of which were moline, the other flower delis, azure, and under a tongue of fire proper. This badge or emblem was embroidered or a yellow white robe.

BRIDGE-TOWN, in Geography, the capital of the island of Barbadoes, situate in the south-western part of the island, in the parish of St. Michael, and in the innermost part of Carlisle bay. This bay is large enough to contain 500 ships, being one league and a half long, and one broad; but the bottom of it is foul, and apt to cut the cables. The town lies at the entrance of St. George's valley, which runs several miles into the country. It has a free-school, an hospital, and a college, founded and liberally endowed by colonel Codrington; but its success is fad not to have answered the deigns of its founder. It has also commodious wharfs for loading and unloading goods, and is well defended by a number of forts; such as James fort on the west, Willoughby's fort on a tongue of land running into the sea, Needham's fort, and St. Anne's fort, which lies more within the land. But thus secured from foreign enemies, it is very subject to hurricanes, and it has often suffered from fires. It was burnt down in 1688; and in 1765, 1766, and 1767, the greatest part of the town was destroyed. Before the destruction occasioned by the two last of these fires, it contained 1500 houses, mostly constructed of brick, very elegant, and said to be the finest and largest in all the Caribbean islands; the town has been since rebuilt; but it had severely riven from its ruins, before it was made a scene of devastation by a violent storm in 1780. See Barbadoes. It is again recovering its former splendour. The streets are paved, and the houses lofty, and well built. The church of St. Michael is as large and beautiful as many cathedrals, and is furnished with an excellent organ and ring of bells, and a curious clock. Upon the whole, the town is deficient of few elegancies or accommodations for entertainment and amusement which are to be found in the cities of Europe. This is the seat of the governor, council, assembly, and court of chancery, &c. Within a mile of the town to the north-eaft, the governor has a handsome country villa, built by the assembly, called "Pilgrims." The number of militia for Bridge-town and the precinct of St. Michael is 1200 men, who are called the royal regiment of foot-guards. Packet boats have been lately established to carry letters to and from Great Britain monthly. The adjacent grounds are low and flat, and were often overflowed by the spring-tides, which rendered the situation of the town insalubrious; but most of them have been drained, and it is now reckoned as healthy as any place in the island. N. lat. 13° 9' 30". W. long. 60° 8' 30".

BRIDGE-TOWN, a settlement of America in Cumberland county, and district of Maine, having Hebron on the N.W. and Bakers-town (on the west side of Androscoggin river) on the S.E.; which three settlements lie on the northern side of little Androscoggin river. It contains 529 inhabitants; and lies 34 miles N. by N.W. from Portland, and 156 N.E. from Boston. Bridge-town consists of large hills and valleys; the highland affords red oak of large size, and the valleys are covered with rock maple, ash, elm, birch, pine, and hemlock. In this district is a pond, on the east side of which is a cove, extending about 300 rods farther to the east than the general course of the shore, and is shallow, that a man may wade 50 rods into the pond. On the bottom of this cove are stones of various sizes, which appear to have an annual motion towards the shore, though some of them are two or three tons in weight. The shore of the cove is lined with these stones, which seem to have moved out of the water.

BRIDGE-TOWN, the chief town of Cumberland county in New Jersey, near its centre; 50 miles S.S.E. of Philadelphia, 80 S. by E. of Trenton, and 145 S.W. of New York. Also, a small town in Queen's county, Maryland, lying on the western side of Tuckahoe creek, 8 miles E. from Centreville, as far S.E. from Church-hill, and 65 S.W. from Philadelphia.—Also, a town of Kent county in the same state, seated on the north bank of Chester river, 7 miles S.E. from Crofts Roads, and 4 furthither from Newmarket.

BRIDGE-TOWN, in the island of Antigua. See WILLOUGHBY BAY.

BRIDGEWATER is a large, populous borough, and market town of Somersetshire, England, seated on the river Parret, which winds in a bold stream hence towards the estuary of the Bristol channel. The town is situated in a flat and rather woody country, having rich moors to the north and eafe. It was formerly of much greater importance than at present, as it has suffered material injury by means of conflagrations, and various vicissitudes of warfare; particularly in 1645, when the town was besieged by the parliament's army under the command of Sir Thomas Fairfax, who committed great devastations. The markets are on Thursdays and Saturdays; and for the accommodation of those who frequent them, a spacious and convenient market-house was erected. There are also four annual fairs. Bridgewater is a very ancient corporation, governed by a mayor, recorder, two aldermen, and twenty-four common-councillors. The town was formerly protected by a castle, the greater part of which was demolished during the civil wars. It was in the castle yard, or castle fields at Bridgewater, that the duke of Monmouth encamped his raw and undisciplined troops, previously to his battle on Sedgemoor, where he was defeated. The castle and manor were formerly held by the queens of England. The corporation have also their peculiar manor within the town. The church dedicated to St. Mary is a large handsome structure, with a tower and spire at the west end. A very fine altar piece was given by the Hon. Anne Powlett. Here was formerly an ancient hospital founded by William Bri- were in the time of Henry III., but not a villige of it remained.
Bridgewater sends two members to parliament; and the right of voting is vested in the inhabitant householders paying rate and lot. The revenues of the corporation, consisting of the manor of the borough, the great and small tythes, with some manors in Dorsetshire, are valued at 500l. per annum. The authority of the magistrates extends throughout the parish, and the corporation are conservators of the river Parret. The burgesses are free in all parts of the united kingdom, except London and Dublin; and the sheriff of Somersetshire cannot fix any process into the borough, it having been made a county within itself by Henry VIII. It was made a free borough by king John, a mayor town by Henry IV., and sent to parliament 23rd Edward I. This borough was formerly under the patronage of the celebrated Bubb Doddington, and has been the object of strong contention in different elections. The Biddonover county feoffons are constantly held here; and the alizes every other year. At the port there manufactures of Manchetter, Liverpool, Birmingham, &c. are landed for the use of the western counties. The duties paid for imports are very considerable. Coals are also brought from the Welch coast to supply the town and neighbourhood: the duty on which for seven years was estimated at between 15 and 17,000l. Thirty-two vessels belong to the port from 20 to 120 tons burthen. The town contains 473 houses, and 3694 inhabitants, 956 of whom are engaged in trade and manufactures. The houses are built in an irregular manner; but the principal street is wide, and well paved. The quay is also large and commodious. There are several meeting-houses for presbyterians, annabaptists, and quakers; and it is a singular circumstance, that in one of these there is a pew appropriated for the mayor and aldermen, should they be of that persuasion. Bridgewater is 147 miles W. from London, and 12 S. from the Bridgford channel. A suburb called Eastover, is joined to the town by a strong stone bridge. See Sedge- moor. Collinson's History of Somersetshire, vol. iii. 400. 1701.

Bridgewater, a township of America, in Grafton county, New Hampshire, incorporated in 1769, and containing 281 inhabitants.—Alfo, a township of Somerset county, in New Jersey, containing 2778 inhabitants, including 377 slaves.—Alfo, a considerable township in Plymouth county, Massachusetts, containing 4975 inhabitants, of whom many are manufacturers of hardware, nails, &c.; about 30 miles E. of S. from Boston.—Alfo, a township of Windsor county, Vermont, about 55 miles N.E. of Bennington, containing 2933 inhabitants.

Bridle, from la bridle, Fr. in the Manege, is an instrument for the guidance and management of the horse by the hand, and is composed of the bitts and reins, which see.

"It is probable, that some time must have elapsed before the instrument called a bit was used for the government of horses, by putting it into their mouths. By looking back into antiquity for the practices of past times, and the origin of many customs defended to us, we everywhere find the greatest plainness and simplicity in their first state; and the more ancient, the ruder and simpler they were. The style of architecture, the fashion of the habits and dressers of early times, the method of preparing food, and many articles besides, are convincing proofs of this assertion. By degrees light broke in, and men advanced progressively from one improvement to another. It is curious to observe, that in ancient Greece many of the terms appropriated to navigation were also used in horsemanship. The word καλλία, or κελος, which signifies a ranier, served likewise, as Suidas says, to denote light falling vessels, and swift horses. Homer calls ships horses of the sea; and the pilot, the coachman or driver of the vessel. Pindar calls a bridle an anchor; and in this sense Neptune may properly be called the inventor of the horse, which implied no more than a slip. These little observations are only offered to the reader as an argument that bits and bridles were used in the most distant ages; but at what exact period to fix their origin, is a tale by no means easy to perform. It is probable to suppose, that the people of the first ages of the world, prompted by their necessitities, and acting from them alone, made no other use of the horse at first than what might be for domestic purposes, teaching him to subtil to carry men and burdens; and having reconciled and made him patient, they taught him, by degrees, to distinguish and obey the different sounds of the voice, as well as to be directed by the guidance of a switch or wand which the rider carried in his hand. It is, however, apparent, that they made use of cords or thongs to stop and confine the horse in any place where they chose he should stay. These cords they fastened round the horse's neck, as may be seen in the figures, though of a much later date, carved upon Trajan's pillar at Rome. These ropes hanging down from the necks of horses, are imagined to have suggested the first hint of traces for drawing machines. Strabo says that the Moors, or Africans, used cords for bridles. It is probable to think, that after a time they might discover, that if a cord was put into the mouth, or at least over the nose, like our halters, which may be used both ways at the same time, it would be a more effectual method of guiding and controlling the horse; and hence is derived the supposed origin of bridles, which, in after ages, have been multiplied in such numbers, and under such a variety of shapes, increasing and improving as men grew more skilful in riding, and applied it to various purposes." Berenger, Hist. of Art of Horsemanship, vol. i. p. 40.

When bridles came into fashion, the most remarkable were thes called "lupata," having bits of iron resembing wolves' teeth, to which Horace refers, l. i. od. 8.

"Cur nque militaris
Inter aquas equitum, Callipe nec hepatis,
Temperat ora franchis?"

Virgil (Georg. ii. l. 115.) seems to ascribe the first invention of them to the Lapitha, or Centaurs, who inhabited a town in the Thessaly, called "Pektirionum," when he says,

"Ferrea Peltorhionum lapithae, gyroque dedere
Impositi dorfo."

But some are of opinion, that he speaks of bridles, as invented not by the Lapitha, but by a person of that nation, whose name was Pelecrhonius, to whom Pliny (Hi. N. L. vii. c. 56.) attributes the invention of them.

Bridle, in Anatomy. See Fossa Nasi.

Bridle, among Surgeons, is a kind of Bandage contrived for retaining the lower jaw in its place.

Bridle, foolding, or Brank, an instrument formerly used in some parts of Scotland, and in Staffordshire, for correcting foolding women. It consists of a kind of head-piece, which opens and inclines the head, whilst an iron appendage is put into the mouth, and takes particular hold of the tongue, which it effectually keeps from flaring: thus harnessed, the offender is led in triumph through the streets. A figure and description of the Staffordshire bridle is given by Dr. Plot, who prefers it to the ducking-stool, which not only endangers the health of the party, but also gives the tongue liberty betwixt successive dips; to neither of which inconveniences this instrument is liable.

Bridle chain, in Husbandry, a name given by our farmers to a part of the structure of their Plough. This is an iron chain of several links, fastened at one end to the beam of the plough, near that part where the collar receives the
the tow chain; and fastened at its other end to the flake of the plough, or to that upright piece which runs parallel to the left cross-ripple, and at its bottom pins in the tow-chain; this flake is fastened to the cross-ripple, sometimes by the end of this trident-chain, and sometimes by a yoke or cord.

Bridles, in the Metage, signifies the horsemans left-hand, in respect of which the right hand is called the spear or sword-hand.

Bridles in Scowl-speak, denote the upper part of the murrings in the king's harbours, to rule ships of war.

Bridles of the bow-line. See Bow-line.

BRIDLINGTON, or BURLINGTON as sometimes written, in Geography, is a seaport town of the east riding of Yorkshire in England. It is built on the shore of a bay, to which it gives name, which is found to be a safe harbour for vessels, when the wind is strong from the N. N. W. and N. E., being secured by two projecting piers of considerable extent, running out obliquely into the sea, and rendering the entrance very narrow. The principal trading vessels are colliers, and most of the inhabitants are connected with these. Here was formerly a priory of black canons, founded early in the reign of Henry I. The church has been large, but its choir, transept, and screen, have been entirely destroyed, leaving only the nave for parochial service. A Mr. William Hufler was a considerable benefactor to the town, and in the 17th Charles II. Richard Boyle baron Clifford was erected earl of Burlington, (from this town). In the 8th William III., and 11th of George I. acts of parliament were obtained to repair the piers, &c. of the harbour. Bridlington is now frequented as a bathing place; it lies at about 10 miles S. W. of Flamborough-head, 40 east of York, and 206 north from London. The houses amount to 707, and inhabitants to 3150. Gough's edition of Camden's Britannia.

BRIDON, or Broidon, in the Metage, is derived from the French Brion, a diminutive of la bride. By la bride, the French denote the reins going to the curb; and by broidon, the reins going to the snaffle or leffer bit, which is held in reserve in case of any accident with the former. In the English language, it is called a broidon, and a very different use is made of it. The reins of the broidon pass parallel to the line of the horse's head, through a loop hanging from the head stall, and from thence to the hook of the faddle, for they are only used in harness or horses at present, especially of the richer orders of society, and where elegance of appearance is considered. The rein so disposed draws against the corners of the mouth, and not upon the bars, as the snaffle does, and tends more forcibly to elevate the head, as the curb does to depress it; though they are often used at one and the same time, the snaffle having an intermediate effect.

Bridles of late have been constructed with a property, somewhat similar to the broidon, to be used with the hand, the rein passing from the head stall, through a tube or pipe placed in the situation of the crofs piece of the snaffle, to the hand; so that when drawn tight against the mouth, it presses the cheeks upwards, and shortens the head-stall which has not a good appearance. A ring is also fixed to this hollow crofs piece for the reins, as in the ordinary snaffle, so that the rider has it in his option to use either.

Bridport, in Geography, an ancient borough, market and manufacturing town of Dorsetshire, England, is situated in a vale at the distance of about one mile north of Bridport bay. It is nearly surrounded by eminences, some of which assume a conical shape; and on its western and eastern fides, run two small rivulets, which are highly useful to the manufacturers. Seated on the great western road, at the distance of 135 miles S. W. from London, it derives many advantages from travellers, and further advantages from its contiguity to the English channel.

It seems to have been a very considerable town before the conquest, as it is thus noticed in the Domesday Book: "In Edward the Confessor's time, here were 120 houses, subject to every service to the king, and paying geld for 5 hides, viz. to the use of the king's demesnes, (Hufcarles) a mark of silver, except the customs pertaining to the farm of one night for one night's lodging. Here was one mill-master, who paid to the king one mark of silver, and 20 shillings on the charge of coinage. Now there are but 100 houses, and the remaining 20 are ruined, that the inhabitants are unable to pay the tax." The manor anciently belonged to, and was held of the crown, in fee-farm by the burgesses, to whom it now belongs. The town received its charter of incorporation from Henry the III., who granted "to the men of Bridport, that the village should be a free borough; and that they and their heirs should hold it, with all liberties, &c. paying yearly to the exchequer at Michaelmas, the farm which they usually paid, and 40s. for the increas of the village." The charter now in force was granted by Charles II. The earliest return to parliament was made in the twenty-third of Edward I. The right of election is vested in the inhabitant householders, paying foot and lot, and the number of voters is about 160. This town does not seem memorable for any historical transaction, though it appears to have been alternately the quarters of the royal and parliament's troops during the civil wars; and in the duke of Monmouth's rebellion, several exiles were committed here by his forces. In 1655, the town exhibited a solemn scene, when twelve of its inhabitants were executed for being actively concerned in that rebellion. The town is large, and has a very respectable appearance; many of the houses being new brick buildings, and its principal streets are broad and spacious. The number of houses is 289; of inhabitants 3177, who are principally supported by the manufacture of reams, and nets of all sorts, lines, twines, and small cordage, as well as sail-cloths. Large quantities of these articles are exported to America and the West India islands; but the greater part is consumed in the Newfoundland and British fisheries; it being computed that upwards of 1500 tons of hemp and flax are worked up annually. This manufacture was so flourishing in the reign of Henry VIII., that cargoes for the whole English navy were every V. I. to be made exclusively here, or within five miles of the place. A handsome market-house and town-hall has been erected in the commencement of the town, on the ruins of an old chapel dedicated to St. Andrew. Here were formerly several religious foundations, no relics of which now appear. Here are also a charity-school, three alm-shafts, and a gaol. The church is a large ancient pile of building, in the form of a crofs; the tower in the centre of the structure is adorned with pinnacles and battlements. The diluters in this town have meeting-houses, and are both numerous and respectable. The canopy is situated at the mouth of the river Brid, a mile fromh the town. It does not appear that Bridport was of any consequence in maritime affairs; and although several attempts have been made to make it a port, they have all proved ineffectual. The cliffs here are composed of sand, though the surrounding country is covered with lime-fune full of shells. The height of the cliffs is in some places nearly 200 feet; and they contain belemnites and other fossils; besides pyrites, gypsum, hepatic ore, &c. Giles de Bridport, consecrated bishop of Salisbury March 11, 1256, was, according to Leland, "cauliff Bridport, because he was born," in this town. The markets are Wednesday and Saturday; and there are three fairs annually. Hutchins's History of Dorsetshire, vol. i.
BRIEF, in Geography, one of the largest and most fertile principalities of Silesia, surrounded by those of Oleś, Breslau, Schweidnitz, Munsterberg, Nystadt, Oppeln, and in a detached part of it bordering on Poland. Its form is irregular; its extent being about 36 miles in length, and from 8 to 21 in breadth. It produces corn, rye, and tobacco. The first duke of Bries was Wolfenbüttel (1126), who obtained it in 1134. From him it descended to Frederick II. who embraced Lutheranism in 1523; and in 1537 concluded a compact of fraternity and succession with Joachim II., elector of Brandenburg; and on this was founded the claims of Frederick II. king of Prussia. The chief towns of this principality are Bries, Ohlau, Striche, Ocinplitz, Creutzburg, and Pitschen; and its chief rivers are the Ohlau and Oder.

Brief, in Latin Briefe, a city of Silesia, a circle-town, and the capital of the above province; seated on the river Oder.

BRIEF, or Brevis, a town of Asiatic Turkey, in the Arabian Israel; 140 miles N.W. of Bassora.

BRIE, the name, before the revolution, of a district in France, situated partly in Champagne, and partly in the Ile of France, and called from its particular situation "Brie Champenoise," and "Brie Françoise," or "Brie Parfaicienne." The principal towns are Meaux, Provins, and Chateau Thierry.

Brief for Hierarchy, or Brief de Robert, so called from Robert of France, count of Brie, a former poissillon, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Melun, settled on the Yerre, and is partly S.E. of Paris. The town contains 2,571, and the canton 8,089 inhabitants; the territory comprises 170 kilometres, and 15 communes.

BRIEG, a town of France, in the department of Finisterre, and chief place of a canton, in the district of Quimper; 12 leagues N.W. of Quimper. The town contains 5,000, and the canton 47,35 inhabitants; the territory includes 222,24 kilometres, and 2 communes.

Brief, formed from the French brief, of the Latin brevis, which signifies the name, denotes a thing of short extant or duration. It is more particularly used for a summary, or short slate of a thing; and also for an act or writing drawn up by a notary.

Brief attested, Breve testatum, a public instrument clothed with the proper formalities.

Brief of devising, Brevis divisionalis, denotes a last will or testament, or devise.

Brief of an oath, Brevis sacramentum, an instrument made on oath, and authenticated by the subscription of witnesses.

Brief is also used for a judicial epistle, directed by a lord or other superior to his subjects or dependants, enjoining some thing to be done or forborne. In which sense, we say, the lord's, king's, bishop's, or pope's brief.

Brief also denotes the territory or district within which the lord's brief had course. In which sense, we meet with the bishop's brief, breve episcopi, the count's brief, breve comitis, &c.

Brief also denotes the yearly revenue arising out of the lands usually described in briefs.

Brief, Brevis, in Common Law, is so called, quia breviter intentionem profert, ut brevis, because couched in a few plain words without preamble, &c. See Brief.

Brief also signifies an abridgment of the client's case, made out for the introduction of counsel, on a trial at law; in which the case of the party is to be briefly but fully stated; the proofs must be placed in due order, and proper answers made to whatever may be objected against the case of the client by the opposite side; and in preparing this, great care is requisite, that nothing be omitted to endanger the case. An attachment has been granted against a party and his attorney, for unreservedly getting possession of the brief of a counsel on the other side, and applying the same to an improper purpose in his defence. 1 Dowl. P. C. 519. Although a brief is not of itself evidence against the party for whom it is prepared, yet, as the discovery of the secrets and merits of his case may be productive of perjury or subornation of perjury, and thereby obstruct the justice of the court in which the suit is depending; the obtaining of it in a surreptitious manner is an offence highly deserving censure and punishment.

Brief, in State Law, a writ issued from the chancery, directed to any judge, ordinary, commanding and authorising that judge to call a jury to inquire into the case mentioned in the brief, and upon their verdict to pronounce sentence.

Brief a P. Eryxium, denotes a writ to the bishop, which, in "quae impedit," shall go to remove an incumbent, unless he restore, or be presented; "pendente lite." 4 Rep. 368.

Brief is also used for a letter patent, granting a licence for collecting money to rebuild churches, relieve lost by fire, &c.

Churchwardens are, by flat. 4 Ann. c. 11, to collect money upon these briefs, which are to be read in churches, &c. and the funds collected to be indorsed on the brief in words at length, and signed by the minister and churchwardens; after which they shall be delivered, with the money collected, to the persons undertaking them, in a certain time, under the penalty of 20l. A register is to be kept of all money collected, &c.; and the undertakers, in two months after the receipt of the money, and notice to sufferers, are to account before a master in chancery, appointed by the lord chancellor.

Briefs, apostolical, denote letters which the pope dispatches to princes and other magistrates, touching any public affair. They are thus called, as being very concise, and written on paper, without prefix or preamble; by which they are distinguished from bulls, which are more ample, and always written on parchment, and sealed with red wax; whereas briefs are sealed with white wax; and with the seal of the fisherman, or St. Peter in a boat; a seal is never applied, but in the pope's presence. The brief is headed with the name of the pope, apart; and commences with "Dilecto filio suum," et apostolicae benedictione, &c. after which it proceeds directly to the matter in hand, without further preamble. Briefs are not suberbished by the pope, nor with his name, but with that of his secretary. Pope Alexander VI. instituted a college of secretaries for briefs; since which time they have been made much longer, and more ample than before. See ABBREVIATOR. Formerly briefs were only dispatched about affairs of justice; but now they are likewise used in matters of benefices, exchequer, and dispensations.

Brief of the dead, Brevis mortuorum, were letters sent by the monks of one monastery to the others of another, with whom they were in fraternity, to inform them of the deaths or obits of their monks, for whom they were to say the fatted and customary prayers and masses.

These were also called brevia eurrentia, a formula in which we have in the book of the usages of the Cistercian order.

Brief of remembrance, Brevis recordationis, or memorandum, or memorable, denotes a character, otherwise called NOTITIA.

Brie, in Geography, one of the largest and most fertile principalities of Silesia, surrounded by those of Oleś, Breslau, Schweidnitz, Munsterberg, Nystadt, Oppeln, and in a detached part of it bordering on Poland. Its form is irregular; its extent being about 36 miles in length, and from 8 to 21 in breadth. It produces corn, rye, and tobacco. The first duke of Bries was Wolfenbüttel (1126), who obtained it in 1134; from him it descended to Frederick II. who embraced Lutheranism in 1523; and in 1537 concluded a compact of fraternity and succession with Joachim II., elector of Brandenburg; and on this were founded the claims of Frederick II. king of Prussia. The chief towns of this principality are Bries, Ohlau, Strichen, Nimptsch, Creutzburg, and Pitschen; and its chief rivers are the Ohlau and Oder.

Brie, in Latin Briefe, a city of Silesia, a circle-town, and the capital of the above province; seated on the river Oder.
BRIENNE-LE-CHATEAU, a town of France, in the department of the Aube, and chief place of a canton, in the arrondissement of Bar-sur-Aube, 4 leagues N.W. of Bar-sur-Aube. The place contains 3,193, and the canton 4,062 inhabitants; the territory comprises 27 square kilometres, and 28 communes.

BRIENNOIS, a name given before the revolution to a small district of France, in Burgundy, near the Loire, of which Semur-en-Briennois was the capital.

BRIENON, or BRIENNO, a town of France, in the department of the Yonne, and district of Auxerre; 2 leagues W. of St. Florentin.

BRIENTZ, a lake of Switzerland, in the canton of Bern, about 8 miles long and 2 wide; situated nearly at right angles with the lake of Thun.—Also, a town of Switzerland in the same canton, adjacent to the lake, and N.E. of it; famous for the cheese made in its vicinity; 22 miles S.E. of Bern. The river Aar runs through the centre of this lake.

N. lat. 46° 31'. E. long. 7° 52'.

BRIENZA, a town of Naples, in the Principato Salerno; 20 miles N. of Poligiorno.

BRIES, BREZNA, BREZNO, or BANI, a royal free town of Hungary, seated on the river Gran, which by succ-
Brigantes, where they regulate together the guards, parties, detachments, and convoys, and appoint them the hour and place of rendezvous at the head of the brigade, where the brigade-major takes and makes them to the place of general rendezvous. A major of brigade ought to keep a roll of the colonels, lieutenants-colonels, majors, and adjutants, belonging to the brigade. When a detachment is to be made, the major-general of the day regulates with the brigade-majors, how many men and officers each brigade shall furnish; and they again, with the adjutants of the regiments, how many each battalion is to send, which the adjutants divide among the companies. The complements each regiment is to furnish, are taken by the adjutant at the head of each regiment, at the hour appointed, who delivers them to the brigade-major at the head of the brigade, who again delivers them to the major-general of the day, and he remits them to the officer who is to command the detachment.

BRIGADIER-GENERAL, an officer whose rank is the next above that of a colonel, appointed to command a corps consisting of several battalions or regiments, called a brigade. Every brigadier marches at the head of his brigade upon duty. The brigadier of foot commands him of horse in garrison, and the brigadier of horse, him of foot in the field. Brigadiers of the horse-guards command youngest captains of horse, who have generally some higher rank in the army.

SUB-BRIGADIER of a troop of horse-guards, an assistant of the brigadier.

BRIGADINE, in Heraldry, a jacket or coat of mail, consisting of a number of small plates of iron, sewed upon quilted linen or leather, covered with the same, and worn by troopers called brigands.

BRIGANDINI, BRIGANTI, BRIGANDINARI, or BRICANT, in Middle Age Writers, military thieves, or highwaymen, who infested France and the Netherlands. See BRABANCIONES.

BRIGANTES, in Ancient Geography and History, a people of very ancient origin, who occupied several parts of Rhetia, the islands of Britain, Spain, &c. According to Stephanus Byzanzianus, they were the same with the Breeci or Brigei; and the Brizes were, according to Strabo (Geogr. l. xii. p. 550.) the same with the Phryges or Phrygians. From a passage in Herodotus (l. vii.) it appears, that they retained the name of Brizes whilst they remained in Europe with the Macedonians; but that when they migrated into Asia, they were disfigured by the appellation of Phryges. Some have thought, that the name of Brigantes was derived from Gomri or Gombrí, the descendants of Gomer, one of the most ancient progenitors of the people of Europe; by colloquing the Celtic cant, denoting a hundred, whence is derived Combríant, and expressing the termination bríant, by the Latin Brigantes. Whatever be the etymology of the name, the Brizes or Brigantes are placed by Steph. Byz. in the mountains of Thrace and Macedonia; and some of them, as Herodotus informs us, passed into Phrygia, whilist others proceeded as far as Rhetia towards the west, where Strabo recognizes them. Here we find the lake "Brigantius," and a town of the Brigantes. From hence they advanced towards the north, following the course of the river Rhine, which signifies, in Celtic, the conductor, as far as the ocean, and crossed it to the British islands. It is not improbable, that others of the Brigantes migrated into Gaul, and there founded the city of the Brigantes, now called Briancon, and that other colonies of the same nation passed into Spain, where we discover a reference to their name in several places. Those Brigantes who traversed the ocean into the isle of Albion became the most numerous and powerful people of the ancient Britons. Their territories reached from sea to sea, quite across the island, and comprehended that large tract of country, which is now divided into Yorkshire and the county of Durham on the east coast, and Lancashire, Westmorland, and Cumberland on the west. These Brigantes are supposed to have been descended, as we have already intimated, from the ancient Phrygians, who were the first inhabitants of Europe, and to have come over into this island from the coast of Gaul, before the Belgæ arrived in that country. They were settled, without doubt, in this island in times of very remote antiquity, and effaced themselves the Aborigines, or first inhabitants of it. The Brigantes were not in the least affected by the incursions of the Romans under Julius Caesar; but Seneca (in Ludo) intimates, more probably, with poetical compliment than truth, that they were subdued by the emperor Claudius:

"__Illa Britannos
Ulto noti litoris ponti, et corubus
Senta Brigantes, dare Romuleis colla catenis
Julli."

It appears, however, that they soon contracted some alliance with, or made some kind of submission to, the Romans. For, when Octavius, the Roman governor, had defeated the Icenii, and was marching his army into the west against the Canti, he was called away by the news of an insurrection among the Brigantes, which he for a while quelled. Tacitus Annal. l. xii. c. 32. But it also appears (Id. l. xiv. c. 36.) that these people were, sometime after this, governed by their own princes, particularly by the famous Cartimandua, who was a faithful and useful ally to the Romans. They afterwards commenced hostilities against the Romans in the beginning of Vespasian's reign, A. D. 70, and were partly subdued by Petilius Cerialis, then governor of Britain, and soon after totally reduced by the renowned Agricola. Tac. Vit. Agr. c. 17. 20. The country of the Brigantes compassed almost the whole of the fourth Roman province in Britain, called "Maxima Caelebris," and was governed by the confidant president of that province. During the times of the Romans, this was a frontier province, and was therefore much frequented, and carefully guarded by that people. The towns of the Brigantes were Epipactum, Vinovium, Curtaractonum, Calatum, Hortum, Rigedunum, Olicana, Eboracum, and Camulodunum; which see respectively, Henry's Hill. Book i. c. 3. § 1.

The Brigantes of Ireland are supposed to have lived in that part which is now the county of Waterford, adjoining the river Brigs. It is natural to conclude that there were either a colony of the Brigantes of Britain, or sprung from the same race. Even general Vallancey seems to admit this; and he has quoted a passage from a work of Mon. Brigante, showing the Brigantes to be Celts of the posterity of Japhet, and to have received their name from their attention to navigation. That they proceeded immediately from Germany and Rhetia is rendered probable by Plutarch's having placed near them the Carvei and Menapii, people found in Germany on the coasts of the ocean. The English words, brig and brigantine, are supposed to be derived from the same source.

BRIGANTI, ASINIAL, in Biography, a celebrated Neapolitan physician, who flourished the latter part of the 16th century, published, in 1577, at Naples, two small works in Italian, 4to. the one containing "Regulations proper to be observed for preventing the propagation, and diffusion of the plague;" the other, "On the prevention and cure of the meales;" also, "Epilobio medicinale." Svo. 1578; much commended by Toppius. The author treats largely

BRIGANTINE, a small, light, flat, open vessel, which goes both with sails and oars, and is either for fighting or giving chase.

It has usually twelve or fifteen benches on a side for the rowers, a man and an oar to each bench. Brigantines are principally used by the Corsairs, all the bands aboard being soldiers, and each having his musquet ready under his oar.

But the term is generally used for a merchant-ship with two masts, though mariners of different nations apply it to a peculiar sort of vessel of their own marine. Among English seamen the rigging of a brigantine or brig is little different from the fore and main masts of a ship, the braces of the main on the main-mast leading forward. The after-main-yard must be served from the main-head to the dead-eye, to prevent its being chafed by the main-boom and gaff. The after-luff-ley is fitted with a tackle, that it may be hauled when the main-fall jibes, or is hauled forward by the boom-pendent and tackle. Briggs carry no main-yard, but a cross-jack-yard.

BRIGANTINUS LACIS, in Ancient Geography, a lake of Rhettia, now the lake of Constance, which fec.

BRIGANTITON, or BRIGANTIA, a town of Rhettia, seated on the preceding lake, now Bregenz; which fec. — Also, a town of Galia Narbonnensis, E. N. E. of Saline, in the country of the Catuvenses, near the pass into Italy across the Alps, reckoned in the times of the Romans among the cities of the second order, and exhibiting in the inscriptions, and medals of gold, silver, and copper, which have been found in its vicinity, traces of its ancient importance, now Briason; which fec. — Also, a town of Hispания Citerior, seated at the bottom of a small gulf, north of Magnus Portus, and near it, now Batanoe; which fec.

BRICE-BOTE, BRIG-COTE, or BRIG-COTE, in Ancient Law Writers, signifies a being freed from contributing to the reparation of bridges. See PONZAGE. The word is formed of the Saxon brige, abridge, and cote, compensation. It is sometimes also written bruch-cote, or bruch-cote.

BRIGEUM, in Ancient Geography, a town of Spain, towards the S. W. of Allarica.

BRIGES. See BRIGANTES.

BRIGEUL, in Geography, a town of France, in the department of the Vienne, 8 miles E. of Montmorillon.

BRIGGS, Henry, in Biography, a celebrated mathematician, was born at Warley Wood, near Halifax, in Yorkshire, about the year 1561; and admitted a scholar of St. John's college, in the university of Cambridge, in 1579; where he took the degree of Bachelor of Arts in 1581, that of Master, in 1583; and was chosen fellow of his college in 1588. His favourite study was the mathematics, in which he excelled, so that in 1592 he was appointed examiner and lecturer in that faculty, and soon after reader of the philosophy lectures, founded by Dr. Linacre. Upon the settlement of Gresham college, in London, he was chosen the first professor of geometry, in 1596; and at this time he constructed a table for determining the height of the pole from the magnetic declination; which table was published in Dr. Gilbert's books, "De Magnete," and by M. Blondeville, in his "Theoriques des sept Planetes;" London, 1607, 4to. In 1609 he commenced an acquaintance with Mr. James Usher, afterwards primate of Ireland, which was maintained by a correspondence for several years. In one of his letters, dated March 1615, he informs him, that he was wholly employed about the noble invention of logarithms, lately discovered; which he explained in his lectures, proposing an alteration in the scale of Baron Napier, from the hyperbolic form to that in which 1 should be the logarithm of the ratio of 10 to 1. This alteration was proposed to the baron in a letter; and, in 1616, Briggs made a journey to Scotland for the purpose of conversing with him on the subject; and he repeated his visit in the following year. The result of their conferences, which were conducted with singular mutual respect, was the adoption of his plan; so that upon his return from the second visit, Briggs published the "Chilias prima," or first thousand, of his logarithms, in 8vo. In 1619, he was appointed the first professor of geometry, at Oxford, in the institution founded by Sir Henry Savile; and resigning his professorship at Gresham college, in 1620, he removed to Oxford, and settled at Merton college, where he was soon after incorporated master of arts in that university, and where he continued till his death. Although his time was much occupied in the duties of his office, and in the prosecution of his labours on logarithms, as well as other important subjects, he published, in 1624, a small tract on the "North-west Passage to the South Sea," through the continent of Virginia and by Hudson's bay, occasioned by his being a member of the company trading to Virginia, and reprinted in vol. iii. of Purchas's Pilgrims. His next performance was the extensive and elaborate work, entitled "Arithmetica logarithmica," printed at London, in 1624, folio; containing 30 chilias of logarithms from 1 to 20,000, and from 90,000 to 100,000, calculated to 14 places of figures, besides the index. To this work he prefixed a large dissertation on the nature, construction, and use of logarithms, and on the method of supplying the intermediate numbers from 20,000 to 90,000. He also completed a table of the logarithmic sines and tangents for the whole quadrant, for every hundredth part of a degree, to 14 places of figures, exclusively of the index, with a corresponding table of natural sines, to 15 places; and of tangents and secants for the same, to ten places. These tables, in which the intermediate logarithms of the numbers from 20,000 to 90,000 were supplied by Mr. Adrian Vlacq, of Targowa, in Poland, were published at Gouda, under his care, in 1628; and a translation of this edition was published at London, under the title of "Logarithmicae Arithmeticae," &c. "In 1634, folio. Mr. Briggs had conceived the design of illustrating at large the use of logarithms in the doctrine of spherical triangles, and proposed to complete it in two books; but he lived to write only the first; leaving the second to the care of his old friend Mr. Henry Gellibrand, who finished the work, and it was published at Gouda, in 1633, folio, under the title of "Trigonometria Britannica," &c. "De Doctrina Triangulorum, libri duo, &c." An English translation of it was published in a folio treatise by Mr. John Newton, in 1638, under the same title. In the execution of both these works, Mr. Briggs manifested a very surprising combination of affidious application and inventive genius; and furnished several important discoveries in the mathematics, which have been ufually referred to a later period; such as the binomial theorem (which see); the differential method and construction of tables by differences; the interpolation by differences; angular sections, &c.

This eminent mathematician died January the 26th 1630, in Merton college, and was buried in the choir of the chapel, under the honorary monument of Sir Henry Savile, having over his grave only a plain stone, with his name inscribed on it. Dr. Smith, in his "Comment. de Vit. et Stud. H. Briggs," London, 1707, 4to, gives him the character of a man of great probity, easy and accessible to all, free from arrogance, moroseness, envy, ambition, and avarice, and preferring a fludious retirement to all the splendid circumstances of
of life. The learned Mr. T. Gataker, who attended his lectures at Cambridge, represents him as highly esteemed by all persons skilled in the mathematicks, both at home and abroad. Mr. Oughtred calls him "The mirror of the age for excellent skill in geometry." Dr. Barrow, his successor at Gresham college, in his inaugural oration, celebrates his great abilities, skill, and industry, in perfecting Napier's remarkable invention of logarithms; which, without his care and pains, might have remained an imperfect and useless design.

6. "Animalia" of Geometricals. 4to. 7. "De codem Argumento," 4to. These two last treatises contain a great variety of geometrical propositions concerning the properties of many figures, with several mathematical computations relating to the circle, angular &c.

BRIGHT, Brit. See Logarithms.

BRIGGS, William, was born at Norwich, which city his father represented in parliament, about the year 1652. At the age of 13 he was sent to Bennet college, in Cambridge, and placed under the care of Dr. Afterwards archbishop, Tenison. Having taken his degrees of bachelor, and master of arts, in 1682, he was chosen fellow of the college. He now quitted the university, and went to Montpellier, where he applied diligently to the study of medicine, particularly attending the lectures and demonstration of Viluana, in anatomy. On his return from the continent he published, at Cambridge, "Sphalhographia, five Oculi, ejusque Partium Delineatio Anatomica, cui accedit nova Viisios Theoria," 12mo. 1576. The year following he took his degree of doctor in medicine; and fixing in London, he was made fellow of the College of Physicians, and of the Royal Society. In 1682 his "Theory of Viition," was published in a separate volume by Hook. The year following he was sent to the Royal Society, a continuation of his Theory of Viition, with answers to some objections that had been made to it. This was printed in No. 147 of the Philosophical Transactions. The fame acquired by these works brought him into considerable practice, and he was soon after made physician to St. Thomas's hospital. On the revolution he was appointed physician to king William, and continued in great favour and reputation to the time of his death, which happened at Town Malling, in Kent, September 4th, 1704. Dr. Briggs also sent to the Royal Society, "Exemplum Cæcitatis nocturnæ et Visionis duplicis," which is printed in No. 159 of their Transactions. In 1693, he published a Latin version of his Theory of Viition, with a recommendatory epistle from sir Isaac Newton, affixed to it. In the preface he promises two other works on the subject, viz.

"De Usis Partium Oculi, et de Afflictibus eisibus." These, however, were never printed. Haller Bib. Avit. Gen. Biol.

BRIGHT, Timotheus, a physician of eminence of the 16th century, united, as it was not unusual at that time, the clerical with the medical character. He took his degree of doctor in medicine at Cambridge; and, as we learn from Wood, he was made rector of Mathley, in Yorkshire, in 1591. He appears by his writings to have had a good share of practice, and to have been well versed in the doctrines of the early Greek writers. The work by which he is principally known is his "Treatise of Melancholy," containing the causes thereof, and reasons of the strange effects it worketh in our minds, with the physical and spiritual consolation for such as have thereto adjoined an afflicted conscience," 12mo. 1586, London. He excuses his writing this treatise, contrary to his usual custom, in the English language, from its being a practical work, and to be read by persons out of the pale of physic. It was also done, he observes, by the Greek and Roman writers. He entertained, however, very lofty ideas of the dignity of the medical character. "No one," he says, "should touch to holy a thing that hath not passed the whole discipline of liberal sciences, and washed himself pure and clean in the waters of wisdom, and understanding." The care of melancholy is to be attempted by bleeding, by purges and vomiting. The reasons for using these remedies are assigned. He had before, viz. in 1583, published "De Dyscrasia Corporis Humani," 12mo. London. He was also author of "Hygiene, seu Sanitate tuae, Medicinae Pars prima," 12mo. 1588. "Therapeutica, hoc est de Sanitate retiliueda, Medicinae pars altera," 12mo. 1589. They were reprinted in 1598, in 1610. Haller Bib. Med.

BRIGHTHELMSTON, or popularly BRIGHTON, in Geography, a celebrated bathing place, market and sea-port town, on the Sussex coast, England. Its name is said to be derived from Bright, a Saxon bishop who lived here, or in the vicinity. The town stands mostly on an eminence, which slopes gently to the south-east, where is that beautiful verdant walk called the Steyn, which is the general promenade of the bathing visitors. To the north and north-east, the town is sheltered by a range of hills, called the South Downs, which, by breaking the current of cold wind from the north, render the atmosphere of the town generally mild and temperate. This, combining with a pleasant beach, and the frequent residence of the Prince of Wales, have given much celebrity to Brighton, and occasioned a considerable resort of company during the summer months. This town is mentioned in the Domesday book, by the name of Brilemestone; and Mr. Lee, in his history of Lewes, &c. infers that it was a place of some note in the time of Anglo-Roman dynasty, from the quantity of Roman coins, &c. that have been found in its vicinity. The landed property of Brighton is divided into three manors; and was at the conquest possessed by William de Warren. About this period a castle of Flemings settled here, and appear to have applied themselves wholly to fishing. The town continued merely a small fishing place till a very recent period. It was provided with a market, by charter obtained through the influence of John de Warren, earl of Surrey, in 1343; and in 1773, an act of parliament was obtained for a daily market. The situation of the town on the coast of the island, opposite France, has subjected it to repeated attacks and much distress in the time of war with that nation. At the commencement of the wanton and impolite war proclaimed by Henry VIII. A.D. 1543, against Lewis XII. of France, we find that Brighton was plundered by the enemy, who also wreaked their vengeance by burning many of its houses. In consequence of this
this event, and the continued terror which prevailed during war, the inhabitants resolved to erect fortifications, as some security against future attacks. A block-house for ammunition, &c. walls, gates, and other means of security were therefore provided for the town in 1578, and in 1613. It does not appear that Brighton suffered any thing material from foreign foes after the latter period; but the boisterous ocean now commenced building, and, previously to the year 1615, desolated twenty-two copyhold tenements under the cliffs, besides a good deal of attached land. In the months of July and August, one hundred and thirteen tenements, with the block-house, walls, gates, &c. were and timed by the eneuying waves, which have since made great destructions on this shore. In 1621, Charles II. secretly embarked here for the continent, and thus escaped the vigilant pursuit of his cruel enemies.

In consequence of the repeated damages done by the sea, the inhabitants of Brighton published a large sum of money, and collected much more by brief, &c. in order to raise some artificial barrier; and early in the last century the cliffs were secured by wooden fences, called groins, projecting towards the sea. This town may attribute its popularity to Dr. Richard Ruffell, who, having settled here, wrote a treatise on the importance of sea-bathing, and successfully recommended the practice in nephrologus, and glandular complaints. He caused a valuable mineral spring at Wick, about one mile from the town, to be inclosed in a basin. A building was afterwards erected over it. The name of Ruffell must be held in grateful remembrance by the inhabitants of all watering places, if they reflect that he was the reformer, and great promoter of that highly important restorative of health—sea-bathing. To commemorate his name, the late Rev. Dr. Manningham wrote the following lines,

"Chlor per onsum Ruffelli fama manebit
Dum retinct vires unda marina funs.
Admirant ages Ruffeli name shall know
Till ocean's healing waves cease to flow.

The successor of Dr. Ruffell, (Dr. Rhellan) also contributed to bring Brighton into repute by publishing the natural history of the town in 1760.

Brighton is the iteration for packets between this part of England and Dieppe, &c. Here are several charities, and endowed schools; also a convenient, but small play-house, erected in the year 1782. The church, an ancient structure, stands on a hill, a little north of the town, and contains some curious, and interesting monuments, and inscriptions.

In the east street of Brighton, which forms the western boundary of the Steyn, stands the Marine Pavilion, a residence of his royal highness the prince of Wales. It was finished in the year 1787, and from its eastern front commands a fine view of the sea, &c. Adjoining to this, is an excellent family mansion belonging to the duke of Marlborough; many other elegant houses, handloom rows, squares, and streets, now combine to give Brighton a respectable appearance, and render it attractive, and comfortable for its inhabitants and occasional visitors. It is 51 miles south from London, 8 from Lewes, and contained in 1801, 1427 houses, and 7339 inhabitants. Ancient and modern History of Lewes and Brighton. by W. Lee, 1800.

BRIGOSUM, in Ancient Geography, Brion, a place of Gaul, situate, according to the Theodorean table, between Aedonacum and Raurasia, in the route which leads from Mediolanum to Liminum in Aquitania Secunda.

BRIGINTINS, or BRIDGINTINS, more properly BRIGINTINS, a religious order denominated from their foundress St. Bridget, or Birgit, a Swedish lady, in the fourteenth century, whom some represent as a queen; but Beatrice, on better grounds, as a princess, the daughter of the king Bigerus, legislator of Upland: she is famous for her revelations. The Brigintins are sometimes also called "Order of our Saviour," but being pretended that Christ himself dictated the rules and constitutions observed by them to St. Bridget. In the main, the rule is that of St. Augustin; only with certain additions supposed to have been revealed by Christ; whence they also denominate it the "Rule of our Saviour." The first monastery of the Brigintin order was erected by the foundress, about the year 1345, in the diocese of Limoges; on the model of which all the rest were formed. The Brigintins profess great mortification, poverty, and self-denial, as well as devotion; and they are not to possess any thing they can call their own, nor too much as a halfpenny, nor even to touch money on any account. This order spread much through Sweden, Germany, the Netherlands, &c. In England we read but of one monastery of Brigintins, and this built by Henry V. in 1415, opposite to Richmond, now called Sion-house; the ancient inhabitants of which, since the dilapidation, are settled at Lisbon. The revenues were reckoned at 1643, per annum.

BRIGNE, in Ichthyology, a name given by the French fishermen to the Perca fluviatilis of Limousin. Lacercpe retains this fish in his natural history, under the name of Centrhaus Carp.

BRIGNAI8, in Geography, a town of France, in the department of the Rhone and Loire; 2 leagues S. of Lyons.

BRIGNEUL, in France, a town in the department of the Charente, and district of Confolens; 3 leagues E. of Confolens.

BRIGNOLA, a town in Italy, in the state of Genoa; 23 miles N. E. of Genoa.

BRIGNOLLES, a town of France, and chief place of a district, in the department of the Var, leazed among mountains, in a fertile country, and celebrated for its fruit, and particularly its plums, which take their denomination from it; 6 leagues N. of Toulon. The town contains 5460, and the canton 12,114 inhabitants: the extent of the territory comprehends 160 kilometres, and 6 communes. N. lat. 45° 25', E. long. 6° 15'.

BRIGUS, in Ancient Geography, a river of Ireland, mentioned by Ptolemey, supposed to be the main channel of the rivers Suir, Nore, and Barrow, which unite below the towns of Kins and Waterford. Collect. de Rebus Hibern. Brians, Cape and Bay, lie in the bay of Capetown, on the coast of Newfoundland. The cape is high and rugged, and the bay narrow and deep.

BRIHUEGA, in Geography, a town of Spain, in New Castile, seated on the river Tajuca, the principal commerce of which consists in wool. This town was taken possession of in 1710, by general Standhope, with the English army, in behalf of the archduke Charles; was besieged by the duke of Vendome in favour of Philip, king of Spain, and its garrison were obliged to surrender as prisoners of war. It is distant 43 miles E. N. E. from Madrid. N. lat. 41° 0', W. long. 3° 20'.

BRILL, Matthew, in Biography, a painter of landscape and history, was born at Antwerp, in 1550, and having acquired the rudiments of his art in that city, went to Rome for further improvement; where he acquired such reputation as to be employed by Gregory XIII. in the Vatican, and pensioned till his death in 1584.

BRIL, Paul, brother to the preceding, a painter of landscapes, was born at Antwerp, in 1534, and educated in the art of painting, under Daniel Voetmausch. After his removal to Rome, where he saw the works of Titian and Caracci,
Caracci, he wholly abandoned his Flemish stiff manner, and acquired a more pleasing style, and a charming tone of colour. He succeeded his brother Matthew, both in his employment and genius, but far excelled him in the exercise of his art. The figures in his landscapes were generally painted by Andrew Caracci; and by this circumstance their value was greatly enhanced. His manner of painting is represented as true, sweet, and tender; the touchings of his trees as firm, but delicate; his scenery, situations, and distances are admirable, being commonly taken from nature; and the maffles of his light and shadow as strong, yet, very judicious. In the latter part of life, his landscapes were always both beautiful and exquisitely finished. They were frequently painted on copper. The genuine works of Bril, especially those of the large size, are rare, and afford very high prices in every part of Europe. Within a few years one of his landscapes sold in Holland for 16.5L, and another at an auction in London for more than 120 guineas; and they were thought to be cheap. He etched several landscapes in a masterly, spirited style. This master died in 1626. Pilkington and Strutt.

BRILESUS, in Ancient Geography, a mountain of Greece in Attica. BRill, in Geography. See Briel.

BRILLAC, a town of France, in the department of the Charente; 5 miles N. of Confolens. BRILLIANT, in a general sense, something that has a lucid and bright appearance. BRILLIANT, in the Moneg, is applied to a horse, that is brisk, high-tempered, and fleetly, with an elevated neck, fine movements, and excellent branches, upon which he rears, though ever so little put forward.

BRILLIANTE, Ital. Mufci, spirited, animated, with fire. BRILLIANTS, a name given to diamonds, of the finest water. See DIAMOND.

BRILON, in Geography, a town of Germany, in the circle of the Lower Rhine, and capital of the duchy of Westphalia; having calamine in its neighbourhood; 60 miles E. N. E. of Cologne.

BRIM, the utmost edge of a thing, as of a glass, plate, or the like. The brims of vellums are made to project a little over, to hinder liquors, in pouring out, from running down the side of the vellum. The trimming, or brimming of vellums, was contrived by the ancient potters; in imitation of the supercilium or drip of the cornices of columns; it is done by turning over some of the double matter when the work on the wheel.

Among florists, the brim of a flower denotes the outward edge of the petals, or that part thereof which turns.

A fow is said to brim, or go to brim, when he takes the boar.

The hart goes to rout, the roe to tourn, the boar to brim.

BRIMBATUS, in Natural History, one of the synonyms of Holothuria penalis, which bee.

BRIMENIUM, in Ancient Geography. See BREMEN.

BRIMFIELD, in Geography, a township of America, in the county of Hampshire, and state of the Massachusetts, situated E. of Connecticut river, and containing 1211 inhabitants; 34 miles S. E. of Northampton, and 75 W. of Bolton.

BRIMOND, in Ornithology, one of the synonyms of Anas histriònica; or Harlequin Duck.

BRIMSTONE, a common appellation of sulphur.

BRIMSTONE, flower of. See FLOWER.

BRIMSTONE marble, a preparation of brimstone, in imitation of marble.

Vol. V.

BRIMSTONE medals, figures, &c. may be cast in the following manner: melt half a pound of brimstone over a gentle fire; with this mix half a pound of fine vermilion, and when you have cleared the top, take it off the fire, stir it well together, and it will dissolve like oil; then cast it into the mould, which must first be anointed with oil. When cool, the figure may be taken out; and, in case it should change to a yellowish colour, you need only wipe it over with aqua fortis, and it will look like the finest coral.

BRIN BLANC, Buffon, in Ornithology, trochilus superciliosus, the supercilious humming-bird.

BRINDISI, or BRUNDUSIUM, in Geography, a celebrated city of Naples, in the Terra d'Otranto, situated at the entrance of the Adriatic. It was anciently large and flourishing; and may still be considered as a great city, if the extent of its walls be considered; but the inhabited housetops do not occupy above half the cloisters. The streets are crooked and rough, the buildings are poor and ruinous, and it has no very remarkable church or edifice. It is, however, an archbishop's see, but the cathedral, dedicated to St. Theodore, though a work of King Roger, is inferior in point of architecture to many churches founded by that monarch. Of ancient Brundusium, the remains are merely numerous broken pillars, fragments of coarse Mosaic, the columns of the light-house, a large marble bason receiving the water from basoned heads of deer, some inscriptions, ruins of aqueducts, coins, and other small articles for furnishing the cabinet of an antiquary. Its castle, built by the emperor Frederick II. to protect the northern branch of the harbour, and repaired by Charles v. is large and lofty. The port is double, and is the finest in the Adriatic. The outer part is formed of two promontories, that separate gradually as they advance into the sea, leaving a narrow channel at the base of the angle. The island of St. Andrew, on which Alphonso I. built a fortress, lies between the capes, and secures the whole road from the fury of the waves. In this triangular space, large ships may ride at anchor. At the bottom of the bay the hills recede in a semi-circular shape, and thus leave room for the inner haven, which encircles the city in the figure of a flag's head and horns, and is supposed to have given rise to the name of Brundusium; which, in the old Messapian language, signified the head of a deer. This interior port is peculiarly beautiful, and admirably adapted to every purpose of trade and navigation. It is very deep, extending in length 24 miles, and in its greatest breadth 1200 feet, and is sheltered on every side by the hills and town. In ancient times, the communication between the two havens was marked by lights placed upon columns of the Corinthian order; but of these only one remains entire upon its pedestal. It is of the green and white marble, called "Cipollino," and its capital is adorned with figures of Syrens and Tritons, intermingled with the Acanthus leaf, and upon it is a circular vase, which formerly held the fire. Near it is another pedestal of similar dimensions, with one piece of the shaft lying upon it, but the rest of the column was sold to the people of Lecce, after the earthquake of 1456, which overturned it, and destroyed great part of the city. The interval between these pillars corresponded to the entrance of the harbour; which is very favourably situated for trade. Here goodness of soil, depth of water, safety of anchorage, and a centrical position, are all united; and yet it has neither commerce, husbandry, nor populousness. From the obstructions in the channel which communicate with the two havens arise the various evils that defoliate this dilapidated town. Julius Caesar began its ruin by his attempt to block up
up Pompey’s fleet, by driving piles into the neck of land between the two ridges of hills, and throwing in earth, trees, and ruins of houses; however, Pompey failed and escaped to Greece. In the 17th century, the prince of Taranto sent four ships in the middle of the harbour, to prevent the requisites from entering the port; and they occasioned a devastation of land and sea-works, which cleared up the mouth and rendered it impassable. In 1732, the evil was repaired; and from that period the port became a fastidiously green lake, full of infection and noxious insects; so that no fish but eels could live in it, nor any bird but the canoe made of a single tree. The low grounds at each end were over-flowed with marshes, which produced annually a grievous pestilence, that destroyed or drove away the largest portion of the inhabitants. From 14,000 they were reduced in 1765 to 3,200 lead wretches, tormented with agues and malignant fevers; and in 1775, above 2,000 perished during the autumn. Whereas 50 years before the air of Brindisi was esteemed so wholesome and balsamic, that the convents of Naples were accustomed to send their confusant friars to this city for the recovery of their health. It was at length determined to make some efforts for opening the port again, and plans were drawn up for that purpose. By means of machines, and of the labour of galley slaves, the channel has been partly cleared, so as to have two fathoms of water, and to admit large boats and a free passage to the sea; and thus the water of the inner port is let in motion, and once more rendered wholesome. The plan, however, was found, in 1739, to fail of complete success, and the canal was again in a great measure choked up, so that the pellicent air prevailed as much as ever. But attempts have been renewed for cleaning it again, and opening a passage to the waters, and draining the adjacent marshes; and the inhabitants of Brindisi had a return of health, and are happy in the prospect of returning commerce and opulence. In cleaning the channel, the workmen have found some medals and seals; and they have drawn up many of the piles that were driven in by Caesar, which are small oaks stripped of their bark, and are found as fresh as if they had been felled only a month, though buried above 13 centuries seven feet under the sand.

The soil about the town is light and good, and produces excellent cotton, with which the Brindisians manufacture gloves and stockings.

It is not easy to ascertain who founded Brundusium, and who were its first inhabitants. Strabo says that it was originally occupied by the Cretans, who landed here from Gnoitus with Thesis. Others say that it was founded by the Japyges. The Romans took early possession of a harbour so convenient for their enterprizes against the nations dwelling beyond the Adriatic. They sent a colony hither, A. U. C. 509. Pompey sought an asylum in this city, and from thence fled to Greece. Here Cretians first assumed the name of Castrum, and he concluded one of his short-lived treaties of peace with Antony. Brundusium was celebrated as the birth-place of the tragic poet Pausias, and became remarkable for the death of Virgil. The barbarians, who ravaged every corner of Italy, did not spare so rich a town; and in 876, the Saracens gave a finishing blow to its fortunes. The Greek emperors were desirous of redressing it to its ancient strength and splendour, if the Normans had allowed them opportunity; but after obstinate struggles, and varieties of successes and defeats, they were finally expelled Brindisi by William I. The crucifaces, which drained other kingdoms of their wealth and subjucks, contributed to enrich and establish this city; as it was one of the ports where pilgrims and warriors took shipping. It was also benefited by the residence of the emperor Frederick, whole frequent armaments for the holy land required his presence at this place of noceous. At length the losses of Jerusalem, the fall of the Great Mamluk empire, and the ruin of the Venetian trade, after the Turks had conquered the coast, reduced Brindisi to a state of inactivity and desolation, from which it has never been able to emerge. N. lat. 45° 52'. E. long. 18° 3'. Swinburne’s Travels into the Two Sicilies, vol. ii.

BRINDLIE, James, in Biography, a person of extraordinary genius for mechanical inventions, and distinguished by his skill in planning and conducting inland navigation, was born at Tuxford, in the parish of Woolsthorpe, and county of Derby, in the year 1716. His parents possessed a small freehold, the income of which his father divided by field divisions, and by associating with fervours above his rank; and thus the education of the son was wholly neglected. Urged by the necessities of his family, he contributed to its support till he was nearly 17 years of age, by that kind of labour which, in country places, is assigned to the children of the poor; but at this age he bound himself apprentice to a wheelwright, whose name was Bennet, near Macclesfield in Cheshire, and soon became expert in his business, discovering, at the same time, a singular genius for the extension and improvement of the mechanic arts in general. Accordingly, in the early period of his apprenticeship, he performed several parts of the business without any instructions from his master, and gave so much satisfaction to the millers who employed him, that he was always consulted in preference to his master or any other workman; and before the expiration of his servitude, when Mr. Bennet, by his age and infirmities, became unable to work, he carried on the business with reputation, and provided a comfortable subsistence for the old man and his family. About this time his master was employed in constructing an engine paper-mill, the first of the kind that had been attempted in these parts; but as he was likely to fail in the execution of it, Mr. Brindley, without communicating his design, set out on Saturday evening after the business of the day was finished, and having inspected the work, returned home on Monday morning, after a journey of 50 miles, informed his master of its defects, and completed the engine to the entire satisfaction of the proprietors. Mr. Brindley afterwards engaged in the millwright business on his own account, and soon acquired the reputation of a most ingenious mechanic. The fame of his inventions and contrivances was in a little while spread far beyond his own neighbourhood; and in 1755, he was employed to erect a curious water-engine at Clifton in Lancashire, for the purpose of draining coal-mines, which had before been performed at an enormous expense. The water for the use of this engine was conveyed from the river Irwell by a subterraneous channel, nearly 600 yards long, which passed through a rock; and the wheel was fixed 30 feet below the surface of the ground. In 1755, he constructed a new mill at Congleton in Cheshire, according to the plan proposed by the proprietors, after the execution of it by the original undertaker had failed; and in the completion of it he added many new and useful improvements. He introduced one contrivance for winding the flax upon the bobbins equally, and not in wethed; and another for flapping, in an instant, not only the whole of this extensive flaxen, in all its various movements, but any individual part of it at pleasure. He likewise invented machines for cutting the tooth and pinion wheels of the different engines, in a manner that produced a great saving of time, labour, and expense. He also introduced into the mills, used at the potteries in Staffordshire for grinding flint-flours, several valuable additions, which greatly facilitated the operation. In 1756, he constructed
fructified a steam engine at Newcastle upon a new plan, which vivified his genius for invention and contrivance. The boiler was made with brick and stone, instead of iron plates, and the water was heated by fire-places, so constructed as to save the consumption of fuel. He also introduced cylinders of wood instead of those of iron, and he substituted wood for iron in the chains which worked at the end of the beam. But in these and similar contrivances for the improvement of this useful engine, he was obstructed by interested engineers; and his attention was diverted from the prosecution of them by the great national object of “Inland Navigation.” In planning and executing canals his mechanical genius found ample scope for exercise, and formed a sort of distinguishing era in the history of our country. However, envy and prejudice, and an attachment to established customs, raised a variety of obstacles to the accomplishment of his designs and undertakings; and if he had not been liberally and powerfully protected by the duke of Bridgewater, at the commencement of the privileges, his triumph over the opposition with which he encountered must have been in a very considerable degree obstructed and retarded. The noble duke possessed an estate at Worsley, about 7 miles from Manchester, rich in mines of coal, from which he derived little or no advantage, on account of the expence which attended the conveyance of this article by land carriage to a suitable market for consumption. Fully apprized of the utility of a canal from Worsley to Manchester, he consulted Mr. Brindley on the subject; who, having surveyed the country, declared the scheme to be practicable. Accordingly, his grace obtained, in the years 1753 and 1759, an act of parliament for this purpose; and Mr. Brindley was employed in the conduct and execution of the undertaking, the first of the kind ever attempted in England, with navigable subterranean tunnels and elevated aqueducts. At the commencement of the canals it was determined, that the level of the water should be preferred without the usual obstructions of locks. But in accomplishing this object, many difficulties occurred; and it was soon found that it would be necessary to carry the canal over rivers and many deep valleys, and that it would not be easy to obtain a sufficient supply of water for completing the navigation. However, Mr. Brindley, patronized by the duke, and furnished with ample means of subvention, persevered, and at length conquered all the embarrassments, occasioned by the nature of the undertaking, and by the passions and prejudices of individuals. Having completed the canal as far as Barton, where the river Irwell is navigable for large vessels, he proposed to carry it over that river, by an aqueduct 37 feet above the surface of the water. This was considered as a chimerical and extravagant project; and an eminent engineer, who was consulted on the occasion, ridiculed the attempt. “I have often heard,” says he, “of cats in the air, but never before was flown where any of them were to be erected.” The duke of Bridgewater was not discouraged; but confiding in the judgment of Mr. Brindley, empowered him to proceed with the work; and in about 10 months the aqueduct was completed. This admirable work commenced in September 1760, and the first boat sailed over it the 17th of July, 1761. The canal was then extended to Manchester, where Mr. Brindley’s ingenuity in diminishing labour by mechanical contrivances was exhibited in a machine for landing coals upon the top of a hill. It is no wonder, that an object, so curious in itself, and of such national importance, should have attracted general attention. See CANAL.

The duke of Bridgewater, having found by experience the utility of these inland navigations, extended his views to Liverpool; and obtained, in 1762, an act of parliament for branching his canal to the tide-way in the Mersey. This part is carried over the river Mersey and Bollan, and over many wide and deep valleys. Over the valleys it is conducted without a single lock; and across the valley at Stretford, through which the Mersey runs, a mound of earth, raised for preserving the water, extends nearly a mile. In the construction of this mound Mr. Brindley displayed his mechanical genius, by rendering the canal itself subservient to his design, and by bringing the foil, necessary for his purpose, along the canal in boats of a peculiar form, which were conducted into caissons or cisterns; so that on opening the bottom of the boats, the earth was deposited where it was wanted, and the valley was thus elevated to a proper level for continuing the canal. Across the Bollan the ground was raised by temporary locks, formed of the timber used in the construction of the caissons just mentioned. In the execution of every part of the navigation, Mr. Brindley displayed singular skill and ingenuity; and in order to facilitate his purpose, he produced many valuable machines. His economy and forecast, in every part of the work, deserve to be particularly noticed, and they are peculiarly discernible in the locks, or flood-gates, that are fixed in the canal, where it is above the level of the land. These locks are so constructed, that if any of the banks should give way and occasion a current, the adjoining gates will rise merely by that motion, and prevent any other part of the water from escaping, besides that which is near the breach between the two gates.

Encouraged by the success of the duke of Bridgewater’s undertakings, a subscription was entered into by a number of gentlemen and manufacturers in Staffordshire, for constructing a canal through that country, in pursuance of a scheme which had been suggested some years before; and Mr. Brindley was engaged to make a survey from the Trent to the Mersey. Upon his report that a canal for connecting these rivers was practicable, application was made to parliament, in 1755, for an act to this purpose, which was obtained in the same year. Accordingly, in 1763, this canal, “The Grand Trunk Navigation,” was begun; and it was conducted, with great spirit and success, under the direction of Mr. Brindley, as long as he lived. For a further account of this canal, see CANAL.

The next object which engaged the attention of Mr. Brindley was the construction of a canal from the Grand Trunk, near Haywood in Staffordshire, to the river Severn near Bewdley, by means of which the port of Bristol was connected with the ports of Liverpool and Hull. This canal, about 46 miles in length, was completed in 1772. His next undertaking was the survey and execution of a canal from Birmingham, which should unite with the Staffordshire and Worcestershire canal near Wolverhampton. This navigation, which is 26 miles in length, was finished in about three years. Our engineer advised the proprietors, in order to avoid the inconvenience of locks, and for the more effectual supply of the canal with water, to have a tunnel at Smethwick; but his advice was disregarded; and the managers have since been under a necessity of erecting two steam-engines. The canal from Droitwich to the river Severn, for the conveyance of salt and coals, was executed by Mr. Brindley; and he also planned the Coventry navigation, which was for some time under his direction; but a dispute arising about the mode of executing it, he resigned his office. Some short time before his death, he began the Oxfordshire canal, which, uniting with the Coventry canal, serves as a continuation of the Grand Trunk navigation to Oxford, and thence by the Thames to London. The last undertaking, in which Mr. Brindley engaged, was the canal from Cheddlefield to the river Trent at Stockwith. He was interred.
ferryed and planned the whole, and executed some miles of the navigation, which was finished by his brother-in-law, Mr. Henhall, in 1772. Such was the established reputation of Mr. Brindley, that he was consulted on a variety of occasions; and, indeed, few works of this kind were undertaken without his advice.

He was employed by the city of London, to survey a course for a canal from Hungerford, near Reading in Berkshire, to Monkey Island, near Richmond; but, on account of the opposition of the land-owners, this plan was defeated. He had also, for some time, the direction of the Calder navigation; but, on account of a difference among the commissioners, he declined any further concern in it. In 1766, he laid out a canal from the river Calder, at Cooper’s bridge, to Huddersfield in Yorkshire, which has since been executed. In 1768, he revised the plan for the inland navigation from Leeds to Liverpool; but, though he was appointed engineer for conducting the works, his other engagements obliged him to decline this employment. In the same year, he planned a canal from Stockton, to Darlington, to Wmilton, in the bishopric of Durham. Three plans of the like kind were formed by him in 1769; one from Leeds to Selby; another from the Bristol channel, near Uphill in Somersetshire, to Glattonbury, Taunton, Welling- ton, Tiverton, and Exeter; and a third from Langport, in the county of Somerset, by way of Ilmington, Chard, and Axminster, to the South channel at Axmouth, in the county of Devon. In 1770, he surveyed the country, for a canal from Andover, by way of Stockbridge and Romsey, to Redbridge near Southampton; and, in 1771, from Salisbury, by Fordingbridge and Ringwood, to Christchurch. In 1772 he performed the same office, for a similar navigation from Preston to Lancaster, and from thence to Kendal in Westmoreland. He also planned a canal for joining that of the duke of Bridgewater at Runcorn, near Liverpool, in the execution of which scheme he proposed to have constructed an aqueduct over the river Mersey, at a place where the tide flows to the height of 14 feet. He also surveyed the county of Chester, with a view to a canal from the Grand Trunk to the city of Chester. He revised the plan for joining the Forth and Clyde, and proposed some considerable improvements, which were afterwards adopted by the managers. A canal was also laid out by him for unifying that of Chesterfield, by the way of Derby, with the Grand Trunk at Swarkstone. He was also consulted in the various plans for the drainage of the low lands in different parts of Lincolnshire, and the life of Ely. He gave the corporation of Liverpool a plan for clearing their docks of mud, which has been practised with success; and he proposed a method, which has also succeeded, of building walls against the sea without mortar. The vast of his inventions was an improved machine for drawing water out of mines, by a loosing and gaining bucket, which he afterwards employed with advantage in raising coals.

When difficulties occurred in the execution of any of his works, Mr. Brindley had no recourse to books, or to the labours of other persons; but as all his resources were: those of his own inventive mind, he generally retired to bed, and by there one, two, or three days, till he had devised the expedients which he needed for the accomplishment of his objects. He then got up, and executed his design without any drawing or model, which he never used, except for the satisfaction of his employers. His memory was so tenacious, that he could remember and execute all the parts of the most complex machine, provided he had time, in his previous survey, to settle in his mind, the several departments, and their relations to each other. In his calculations of the powers of any machine, he performed the requisite operation by a mental process, in a manner which none knew but himself, and which, perhaps, he was not able to communicate to others; and after certain intervals of consideration, he noted down the result in figures; and then proceeded to operate upon that result, until at length the complete solution was obtained, which was generally right.

Some have said that Mr. Brindley had been so much neglected in early life, as never to have learned to read and write; and it has also been affirmed, that his aspect was that of an idiot, and his language mean, obscure, and almost unintelligible. But neither of these facts is well founded. Although he read little, and wrote less, he had frequent occasion for correspondence with his friends and employers. His countenance was amiable and animated; but as he was unostentatious in his outward appearance, his dress was always plain. His conversation, on occasions of importance, and among his intimate friends, was instructive and interesting; and enlivened by the singular genius, and the benevolent and patriotic spirit, for which he was distinguished, and which gave energy to his pursuits. His want of literature, indeed, compelled him to cultivate, in an extraordinary degree, the art of memory; and in order to facilitate the revival, in his mind, of those visible objects and their properties, to which his attention was chiefly directed, he secluded himself from the external impressions of other objects, in the solitude of his bed. Dr. Wallis, who was eminently distinguished by the tenaciousness of his memory, so that he could extract the cube root of any number to 100 places of figures in his mind, availed himself, for this purpose, of a similar exclusion. Mr. Brindley’s incessant attention to important and interesting objects, precluded him from participating in any of the ordinary amusements of life, and indeed, prevented his deriving them from any pleasure. Accordingly, though he was once prevailed upon by his friends in London to see a play, he found his ideas so much disturbed, and his mind rendered so unfit for business, as to induce him to declare, that he would not on any account go to another. It is not improbable, however, that by indulging an occasional relaxation, remitting his application, and varying his pursuits, his life might have been prolonged, and his usefulness extended. Whereas the multiplicity of his engagements, and the constant attention which he bestowed on them, brought on a hectic fever, which continued, with little or no intermission, for some years, and at last terminated his useful and honourable career on the 27th of September, 1772, in the 56th year of his age, at Tunsborough, in Staffordshire. He was buried at New Chapel, in the same county.

The talents of Mr. Brindley were of a singular kind; and under the patronage of his grace the duke of Bridgewater, they had an opportunity of being unfolded and exercised to their full extent, in the execution of works new to this country, and which will perpetuate his name to future generations. The brief recital which has been given of his stupendous undertakings, will enable the reader to form some judgment of this extraordinary person. Such was the enthusiasm with which he engaged in all schemes of inland navigation, that he seemed (if we may credit reports) to regard all rivers with contempt, when compared with canals. To this purpose, it is said, that in an examination before the house of commons, when he was asked by a member, for what purpose he apprehended rivers were created? he replied, after some deliberation, "to feed navigable canals." As to his private character, those who knew him well, and had an opportunity of conversing familiarly with him, respected him.
him in a high degree “for the uniform and unshaken integrity of his conduct; for his steady attachment to the interests of his community; for the vast compass of his understanding, which seemed to have a natural affinity with all grand objects; and, likewise, for many noble and beneficial designs, constantly generating in his mind, and which the multiplicity of his engagements, and the shortness of his life, prevented him from bringing to maturity.” —Biog. Brit.

BRINDONES, in Botany, a name given to the fruit of the mangoullan of the Cebellus Islands, the Garciana Cebelica of Linnaeus. In the old French Encyclopaedia, it is erroneously conjectured to be a species of Limonium.

BRINE. This term is used technically for a solution in water of common salt, or any saline liquid in which this salt is predominant. Thus the native springs of salt water are called brine-springs; the sea water is termed brine, &c.

Leach, or leech-brine, is the mother water left in the pans during the manufacture of salt, after most of the pure salt has been obtained by boiling down. It consists of mother-of-pearl mixed with the earthy rudiments, and other impurities of natural brine.

For every thing relating to the manufacture of salt from brine, see Muriat of Soda.

Brine also denotes a pickle pregnant with salt, wherein things are steeped to keep.

Brine-pans, the pits wherein the salt-water is retained, and suffered to stand, to bear the action of the sun, whereby it is converted into salt. There are divers kinds of salt-pans, as the water-pan, second-pan, fun-pan; the water being transferred orderly from one to another.

Brine-pit, in Salt-making, the salt spring from whence the water to be boiled into salt is taken. There are of these springs in many places; that at Nampit, in Chichester, is alone sufficient, according to the account of the people of the place, to yield salt for the whole kingdom; but it is under the government of certain lords and regulators, who, that the market may not be overstocked, will not suffer more than a certain quantity of the salt to be made yearly. See Pit.

Brine-salt. See Salt.

Brine-springs. See Salt and Spring.

BRINER, or BRINET, in Aeronomy, the bright star in the constellation Lyra; more frequently called Lucida Lyrae.

BRINGERS-UP, in a battalion, are the whole left rank of men in it, or the hindmost man in every file.

BRINGING-IN a horse, in the Manege, is the keeping down his nose, when he bares, and toffes it up to the wind. A horse is brought-in by a strong hand branch.

BRING-TO, in Seamanship, to check, or retard, the velocity, or rate, of failing of a ship, by arranging the fails in such a manner, that they shall counteract each other, and thereby prevent her either from advancing a-head, or getting in-door manner. In this situation the ship is said to lie-to, or to lie-by. Bringing-to is generally used to detain a ship in any particular latitude, in order to wait the approach of some other vessel that may be advancing towards her; in waiting for a boat from the shore; or, until there be sufficient depth of water to admit the vessel to fall into a safe harbor.

Brig-up, an expression used for coming to an anchor.

Brig by the lee, is when by bad weather, or otherwise, a ship's head moves from the wind, which the bringes successively alter, and then so far round upon that which was formerly the lee side, that the sails are laid aback.

BRINJAN, in Geography, a town of Hindostan, in the country of Bogdana; 12 miles N. N.W. of Nafluk.

BRINJAUN, or BRINJAM, a town in the peninsula of India, in the Travancore country, on the coast of Malabar; 25 miles W. of Travancore. N. lat. 8° 15'. E. long. 75° 5'.

BRINGING OF Grain, in Rural Economy, the practice of immersing it in some sort of liquor or pickle, with the intention of preventing the fum, or other diseases. Steeps, or pickles for this use, are prepared in various ways, and with very different sorts of materials; but chiefly by diluting salina substantia in water, urine, or some other fluid, till they are very strongly impregnated with them. The grain, after having remained in these steeps a sufficient length of time, as six, eight, or ten hours, or more, according to circumstances, and the light part that swams on the surface removed, is taken out and dried by proper draining, and the fitting of a little lime in a fine powdery rate over it. The fowing should be performed as soon as possible after this has been done, as the grain is liable to be fum injured by its being delayed. How far the use of steeps or brining grain may be advantageous, or whether such practices have any other utility than that of hastening the vegetation of the seed after it is committed to the earth, has not yet been well ascertained by experiment. See Steep.

BRINGING OF Hay, the practice of blending salt with hay in the operation of flaxing, in order to preserve it more effectively, and render it more palatable to animals. It is chiefly had recourse to when hay has been much injured by rain in making. The practice is said to prevail in America.

BRINKE, in Geography, a town of Germany, in the circle of Welfphalia, and bishopric of Olmbruck; 16 miles S.E. of Olmbruck.

BRINN. See BRUNN.

BRINON les Allemands, a town of France, in the department of the Nièvre, and chief place of a canton in the district of Clamecy; 10 miles S. of Clamecy. The town contains 314, and the canton 9959 inhabitants; the territory includes 1421 hectares, and 26 communes.

BRONON l'Archépiale, a town of France, in the department of the Yonne, and chief place of a canton, in the district of Joigny; 4 leagues S. of Auxerre. The town contains 2372, and the canton 12395 inhabitants; the territory comprehends 2572 hectares, and 11 communes.

BRINS, a town of Bohemia, in the circle of Boleflau; 3 miles S. S. E. of Gabl.

BRIOCA. See PRIOCA.

BRIOLLAY, a town of France, in the department of the Maine and Loire, and chief place of a canton, in the district of Segré. The place contains 849, and the canton 6143 inhabitants; the territory includes 1425 hectares, and 8 communes.

BRIOR, a town of France, in the department of the Two Sevres, and district of Thouars; 1½ league from Thouars.—Also, a town of France, in the department of the Lozère, and district of Marvejols; 3 leagues W. S. W. of St. Cheyl.

BRO'N island, one of the Magdalene islands, in the gulf of St. Lawrence, 5 or 6 leagues W. from the Bird islands. N. lat. 45° 50'. W. long. 60° 47'.

BRIONNE, a town of France, in the department of the Eure, and chief place of a canton, in the district of Berny, leant on the Ille. 34 leagues N. N. E. of Berny. N. lat. 49° 51'. E. long. 08° 51'.

BRIONNI, a small island in the gulf of Venice, near the coast of Iliria. N. lat. 43° 10'. E. long. 13° 51'.

BRIONY, in Botany. See BRIONIA.

BRIORD, in Geography, a town of France, in the department of the Ain; 10 miles S. of Belley.

BRION-
BRIAS-TOMAIX, a town of France, in the department of the Oise; 13 miles N. of Beauvais.

BRIAC.q., a town of France, and principal place of a district in the department of the Upper Loire, seated on the river Aixe, over which is a bridge of stone, which is regarded as a Roman work. The town contains 7,936, and the district 1,987 inhabitants; the territory comprehends 263 square kilometres, and 19 communes. This is called “Old Briac,” by way of distinction from “New Briac,” which lies also near the river Aixe, in which is a collegiate church, called St. Julian. N. lat. 47° 14’. E. long. 2° 25’.

BRIOUL, a town of France, in the department of the Two Selves, and chief place of a canton, in the district of Melle; 2 leagues S. W. of Melle. The place contains 742, and the canton 9,225 inhabitants; the territory includes 15 square kilometres, and 22 communes.

BRIOUZE, a town of France, in the department of the Oise, and chief place of a canton, in the district of Argentan; 2 leagues W. of Argentan. The town contains 9,173, and the canton 10,750 inhabitants; the territory comprehends 164 square kilometres, and 11 communes.

BRIQUENAY, a town of France, in the department of the Ardennes, and district of Vouziere; 4 miles N. of Grandpré.

BRIQUERAS, a town of Périgord, in the valley of the Ouche; 4 leagues S. of Périgord. N. lat. 44° 41’. E. long. 7° 54’.

BRISACH, or BREYSACH, Old, a town of Germany, formerly the capital of Brisgaw, seated on the Rhine, and partly upon an eminence, which commands the adjacent country. The bridge of boats over the Rhine at this place was demolished four years ago, and the passage altered to a ferry. It was formerly an imperial city, but mortgaged in 1331, by the Emperor Lewis of Bavaria, to Otto duch of Austria, and the mortgage was ratified by Charles V. in 1548. This place had formerly a fort, which was taken by the French in 1688, but restored in 1697, and again taken in 1705, but surrendered in 1715. The fortifications were razed in 1743, by order of Maria Theresa, queen of Hungary and Bohemia, and the town became an open place. N. lat. 48° 51’. E. long. 7° 49’. See BRISGAW.

BRISACH, New, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the district of Colmar, about a mile from the west side of the Rhine, and opposite to the old town. It was built by Lewis XIV, and fortified by M. Vauban; it stands entirely upon the plain, and its fortresses are so regular that in the great market all the gates of the town are to be seen. The town contains 1,283, and the canton 7,915 inhabitants; the territory comprehends 170 square kilometres, and 16 communes. The road from this place to Bale, 9 leagues N. distant from it, is very pleasant, and commands a prospect on the left bank beyond the Rhine into the marshy ground of Baden. N. lat. 48° 3’. E. long. 7° 26’.

BRISAGA, a town of the Milanese, seated on the borders of the Italian bailiages, and near the wet bank of the Lago Maggiore or lake of Locarno, and 5 miles S. of Locarno. N. lat. 45° 55’. E. long. 7° 31’.

BRISAIU, or BIZAIJOVA, a town of Moravia, in the circle of Olmuzt, 6 miles S. of Zivitau.

BRISBANE, John, in Biography, originally of Kelso, in Scotland, practised medicine several years, towards the end of the last century in London, and published in 1709, “Anatomy of Painting, or a short and easy Introduction to Anatomy, consisting of tables of Albinus, with linear figures on a smaller scale, including Albinus’s figures of the Utensils,” fol. London. Also “Felic’s Cakes in the Practice of Medicine,” 8vo. 1772, London. Among these, are interpolated some useful practical observations. Haller. Eihl.

BRISÉ, in French Arrows, signifies broken, and implies an ordinary with part of it broken off. The English bush it with the word coupled.

BRISÉIS, in Entomology, a species of Papilio, the wings of which are dentate, brown, and glossed with shining green; on the anterior wings two occluded spots, and a white band; two black spots beneath. Inhabits Germany. Linna. Fabr. &c.—This is Papilio Jeanbo of Pallas.

BRISÉIS, in Fabulous History, the wife of Myns king of Lythessa, who was taken captive by Aéchilus, after he had taken the city and killed her husband. But when Agamemnon robbed him of this object of his ardent affection, he became the accidental cause of immeasurable disorders in the Grecian army. Aéchilus, enraged, retired to his tent; and till the death of Patroclus refused to fight against the Trojans.

BRISELLO, in Geography. See BERSELLO.

BRISGAV, a district of Germany, in the circle of Suabia, situated on the east side of the Rhine, by which it is separated from France; a portion of it was formerly possessed by the marquis of Baden, and the principal part belonged to the house of Austria; but by the 18th article of the treaty of Campo Formio in 1797, confirmed by the 4th article of the treaty of Lunéville, in 1801, his majesty the emperor, king of Hungary and Bohemia, bound himself to cede the duke of Modena, as an indemnification for the territory which that prince and his heirs possessed in Italy, the Brisgav; which he is to possess upon the same conditions as those, in virtue of which he possessed the Modena.

BRISIACUS, Mons, in Ancient Geography, a town on the right or east side of the Rhine, now Old Brisach.

BRISCH, or BREYSICH, a town of Germany, in the circle of Wellphalia, and duchy of Jülicher; 16 miles N. N. W. of Coblenz.

BRISGUELA, a town of Italy, in the province of Romagna, belonging to the state of the church; 6 miles from Faveza.

BRISTINO, a town of Naples, in the province of Capitanata; 11 miles S. S. W. of Monfredana.

BKISK, a town of Germany, in the circle of Upper Saxony, and Uckermark of Brandenburg; 8 miles S.S.W. of Beetkow.

BRISKET, in the Manege, that part of a horse extended from the shoulders to the bottom of the chest.

BRISKOW, a town of Germany, in the circle of Upper Saxony, and Middle Mark of Brandenburg; 4 miles S. of Frankfort on the Oder.

BRISSAC, a town of France, in the department of the Maine and Loire, and district of Angers; 28 leagues S.S.E. of Angers.

BRISSEAU, Peter, in Biography, after receiving his degree of doctor in medicine, at Montpellier, went to Paris, where he acquired considerable reputation by his practice. In 1677, he was admitted of the college of physicians at Tournay. He was soon after appointed by Lewis XIV, physician to the military hospitals at Tournay and Mons; and on Tournay’s being taken by the allies in 1709, he removed to Doway, where he died September 10th, 1717, aged 86 years. Brisseau was author of several works; but what acquired him
him most credit, was his " Nouvelles Observations sur la Cataracte," Tournay, 1706, 12mo. continued in 1707, by "Suite des Observations sur la Cataracte." He was the first who demonstrated, that the cataract is a disease of the crystalline lens. Lapicet, and Quarré, who held the same opinion, had not deflected any eyes, affected with the disease, or published anything upon the subject; nevertheless, the College of Surgeons at Paris refused to give Brillat the credit of the discovery. "Observations faites par M. B.," 12mo. 1706. There are all on surgical subjects. He enroil a folder of a wound in the skull, through which a portion of brain had escaped. Two earlier publications by him were "Dissertations on Bleeding," and "Sympathetic Motions." Haller. Bib. Med. et Chirurg.

Brisseau, Michael, son of Peter, and born at Tournay, was admitted member of the college of physicians there in 1716. He then removed to Doway, where he was made first professor in medicine, and physician to the military hospital. He wrote five chirurgical observations, which are printed with Palfins' works in surgery and anatomy. Haller. Bib. Anat. Elyit. Hist.

Brissoïdes, in Natural History. See Echinus.

Brisson, Barnabas, in Biography, an eminent French lawyer and man of letters, was the descendant of a respectable family at Fontenai-le-Comté, in Poitou, and entered at the bar of the parliament at Paris. His reputation was such, that Henry III. advanced him to several honourable offices, and in 1580, to the post of president à mortier; and succeeding very highly of his talents and learning, employed him in various negotiations, and sent him as his ambassador to England. Upon his return he commissioned him to make a collection of all his own ordinances, and those of his predecessors, which he completed with great expedition. The principal of his other learned works are: "De Verborum, que ad jus pertinent, Significatione," fol.; "De Formulis et Scolanibus Populi Romani Verbis," fol. Paris, 1583., a work of authority and frequently cited; "De Regio Perferam Principatu," 1580, frequently printed, and last at Strasburg, in 1710, with the notes of Sylvain and Lederlin; "De Jure Commissariorum Liber Singularius," Paris, 1570, 1574; "Opera Varia," 4to. 1686. The termination of Brillat's life was disastrous; for having continued at Paris, during its siege by Henry IV. in 1589, he was compelled by the league to assume the place of first president of the parliament, instead of Achilles de Harlay, then a prisoner in the Bastille. In consequence of his official conduct, the faction of sixteen brought an accestation against him and some others, members of the parliament; and he was hanged in November, 1591. Several persons were afterwards punished for the concern they had in his death. His public principles are variously represented; some extolling him as a good citizen, others representing him as a man of ambition, who fell a victim to his desire of rising to consequence by means of faction. Nouv. Dict. Hist.

Brisson, St., in Geography, a town of France, in the department of the Loiret, and district of Gica; 4 miles S. of Gien.

Brisot, Peter, in Biography, was born at Fontenai le Comté, in the year 1745, and made doctor in medicine at Paris, in 1754. He then went to Lisbon, where he was soon distinguished for his superior learning, and ability in his profession. As he read the Greek fathers in medicine, in their original language, he was very free in his confutes on the Arabian writers, who had formulated, and disfigured the Greek text, as to make it extremely difficult to discover the authors' opinions, in their translations. This freedom excited the indignation of the followers of the Arabians, which blazed out with great fury, on Brilh's publishing, in 1755, "De Vena secunda tum in pleuritide, tum in utraque inflammaturibus, libellus apologeticus," Paris, 4to. As he maintained, in this work, that blood might be drawn from the side affected in pleurisy, which was contrary to the then prevailing opinion, he was considered an innovator, and treated as a man holding heretical opinions. The work was reprinted in 1756, with some additions by the author, and in 1757, by R. Morceau, with other pieces on the same subject. Haller. Bib. Med.

Brisot, James-Peter, one of the principal agents in the late French revolution, and head of a party distinguished by his name, was the son of a "traitor," or matter of an eating-house, and born in 1754 at Chartres, in the Orléanais. The circumstances of his father enabled him to give his children a good education; and James Peter was destined for the bar. But having served five years as a clerk, with a view to the profession of the law, he abandoned the profession of it with disgust, and determined to devote himself to literature and the sciences. At this time, he formed an acquaintance with some English travellers, learned their language, and perused some English books; and to these circumstances he attributes the character and fortune of his future life. Attached, as he professes himself to have been, to the language and customs of England, he changed the application of "de Querville," which he derived from that of a village where his father possessed some landed property, designed for him, into "de Warville," after the English orthography; and he is thus denominated in his writings. As he had incurred his father's displeasure by relinquishing the profession of the law, his resources failed him; and he was indebted to the bounty of his friends for those supplies, which enabled him to prosecute his studies at Paris, which he continued to do for two years. At the close of this period, he entered into an engagement with the proprietor of a popular paper, entitled "Le Courier de l'Europe," and printed at Bonnogne, which was committed to his superintendence. When this paper was discontinued by the interference of government, Brillot returned to Paris; and soon after, viz. in 1780 and 1781, he assumed, in a more direct and regular manner than he had hitherto done, the profession of an author. Revolting, as he says, from the instant in which he began to reflect, against religious and political tyranny, he determined to devote his whole life to the extirpation, both of the one and the other; but as the former had fallen under the reiterated strokes of Roufleat, Voltaire, Diderot, and d'Alenbert, he had the vanity to think, that the demolition of the latter was an honour reserved for himself. In this work, he seems to have engaged with principles and views, resembling those of his predecessors; and that his intention might not be misunderstood, he avows his purpose to destroy that political idol, which, under the name of "Monarchy," practised the most violent despotism; and, in order the more effectually to accomplish his aim, he began with an attack on certain abuses in government, which needed reformation, and which, with judgment and moderation, might have been corrected, without destroying government itself. Accordingly, he began with directing the attention of his countrymen to the subject of criminal jurisprudence; and, with this view, he published, in 1780, his "Theory of criminal Laws," in 2 vols. 4to., which was soon followed by two discourses on collateral subjects, which gained the prize in 1782 at the academy of Chalons-sur-Marne. He also began a work, which was afterwards completed in 10 vols., entitled "A Philosophical Library of the criminal Laws," and he published a volume "Concerning Truth," and "Thoughts on the Means of attaining Truth in all the Brancas."
Branches of human Knowledge," which he intended, merely as an introduction to a work on a more enlarged and comprehensive plan. During the progress of these political and literary labours, to which, with the confidence of youth, he had annexed ideas of singular importance and utility, although his notions were crude, and his knowledge superficial, he prosecuted the study of several modern languages, and gained an acquaintance with the rudiments of various sciences.

Briffot, at the period of his residence at Boulogne, had been introduced to mademoiselle Dupont, who was employed under mad. de Genlis as reader to the daughter of the duke of Orleans, and whose mother kept a lodging house in that place: and having married this lady, whom mad. Roland extols as a pattern of every domestic virtue, he found it necessary to exert his literary talents for gaining a subsistence. But as France did not afford that unrestrained liberty, which as an author he wished to indulge, he formed a design of printing, in Switzerland or Germany, a series of works in a kind of periodical publication, under the title of "An universal Correspondence on Points intereting the Welfare of Man and of Society," which he proposed to manage into France. With this view, he visited Geneva and Neuchatel, in order to establish correspondences; and he also made a journey to London, which was to be the central point of the establishment, and the fixed residence of the writers. His intentions, however, were divulged by the treachery of one of his confidential associates: and the scheme, romantic in itself, whatever the judicious and candid may think of its ultimate design and tendency, totally failed. During his absence in London, he concerted the plan of a periodical work or journal, on the literature, arts, and politics of England, which, being published in London, was allowed to be reprinted at Paris, and first appeared in 1784. The avowed object of this publication, as he himself declares, was "the universal emancipation of men." In London, he was arrested for debt; but being liberate by the generosity of a friend, he returned to Paris, where he was committed to the baillou, in July 1784, on the charge of being concerned with the marquis Pelleport in a very obnoxious publication. But by the intercession of the duke of Orleans, obtained by mad. Genlis at the intercession of his wife, he was released, on condition of never residing in England, and discontinuing his political correspondence. In 1785, he published two letters to the emperor Joseph II. "Concerning the Right of Emigration, and the Right of the People to revolt," which he applied particularly to the cause of the Walachians: and, in the following year, appeared his "Philosophical Letters on the History of England," in 2 vols. and "A critical Examination of the Travels of the Marquis de Chatelet in North America." With a view of promoting a close, political, and commercial union between France and the United States, he wrote in 1787, with the assistance of Claviere, a tract, entitled "De la France et des Etats Unis, &c." "On France and the United States; or on the Importance of the American Revolution, to the Kingdom of France, and the reciprocal Advantages which will accrue from a commercial Intercourse between the two Nations." Of this work, an English translation was published, both in England and America. At this time, he was in the service of the duke of Orleans, as secretary to his chancery, with a handsome salary, and apartments in the palais royal; and, without doubt, employed in aiding his schemes of ambition. In this situation, he wrote a pamphlet against the administration of the archbishop of Sens, entitled "No Bankruptcy, &c." which occasioned the issuing of a lettre de cachet against him. But to avoid its effect, he went to Holland, England, and the Low Countries; and at Mechlin, he edited a newspaper, called "Le Courier Belgique." For the purpose of promoting the views of a society at Paris, denominated "Les Amis des Noirs," and established for the purpose of abolishing negro slavery, he embarked for America in 1788; and, during his residence in that country, he fought for a convenient situation, in which a colony of Frenchmen might be organized into a republic, according to his ideas of political liberty. But his return was hailed in 1789 by the intelligence he received of the progress of the French revolution; after his arrival, he published his "Travels in America," (Nouveau Voyage dans les Etats Unis, &c. 3 vols. 8vo. Paris, 1791.) and as he found the attention of the public directed to the approaching assembly of the States-General, he wrote his "Plan of Conduct for the Deputies of the People." At this time, he had withdrawn from the partisans of the duke of Orleans; and he took an active part in the plans that were then projected for the organization of the people, with a view to their union and energy in accomplishing the revolution. To the lodgings of Briffot, as a person who was held in estimation at this period, the keys of the baillou, when it was taken, were conveyed; he also became president of the Jacobin club; and he distinguished himself in various ways as a zealous promoter of those revolutionary principles, which, afterwards, gave occasion to a great number of atrocious excesses. After the king's flight to Varennes, Briffot openly supported the republican cause; nor does there seem to be sufficient reason for supposing, that he was secretly concerned in the plot for raising the duke of Orleans to the throne. But as some form of monarchy was still the object of the national will, he was obliged to refrain his impetuosity. The popularity acquired by his writings, and conduct, was such, as to induce the Parliaments to return him as one of their members in the "Legislative national assembly," which succeeded the "Constituent Assembly" in October 1791, of which assembly he was appointed secretary; and he became afterwards a member of the committee of public instruction. Although inferior to many others in talents and knowledge, his activity raised him to the rank of head or chief, in the party denominated "Girondins" or "La Gironde," the name of the department to which several of its members belonged, and also from his own name "Briffotins." In his career of ambition, he does not seem to have been influenced by pecuniary considerations; power, more than wealth, being the object of his aim; for, at this time, he and his family lodged in an apartment up four pair of stairs, and submitted on his elevation as deputy, and the inconsiderable gains accruing from a newspaper. As a determined enemy to monarchy, he was unremitted in his efforts to engage the nation in a war, with the avowed purpose of involving the king and his ministers in difficulties which would terminate in their ruin; and this part of his political conduct must ever be lamented and execrated by the friends of freedom, and of mankind. In the impeachment of M. Delefort, the minister for foreign affairs, Briffot took a principal lead; and alleged against him several articles of accusation, in consequence of which, he was apprehended, tried by the high national court at Orleans, and condemned to die, without being first heard in his own defence; so that he became the first victim to that desperate faction, which afterwards deluged France with blood. His colleagues were so completely terrified by this event, that they requested leave to resign, and the ministry was at once completely dissolved. Their successors, appointed by the king, under the direction and influence of Briffot, were Dumourier, Roland, and Claviere. This appointment was followed by a declaration
of war, decreed by the national assembly, against the king of Hungary and Bohemia; and Briffot, during the existence of this administration, which terminated soon, was considered as the most powerful person in France. About this time, Briffot began to entertain secret jealousy and suspicion, with regard to the views of La Fayette; and he concurred with other members of the assembly, in signing an accusation against him, which, however, he was not able to substantiate. He, and his republican party, were likewise indignant in their endeavours to throw an odium on the court, by alleging, that a private correspondence was carried on between the king and queen and the emperor; and they even averred, that an “Austrian committee,” and a conspiracy in favour of the enemies of the country, existed among the friends of the court. The charge seemed to be unsupported by sufficient evidence; the king publicly contradicted these accusations as calumnies; nevertheless, they made no small impression on the minds of the public. To the writings and conduct of Briffot, the horrid massacres at the Tuileries, on the 10th of August 1792, have been principally ascribed, though he is said to have preferred the lives of several of the Swiss guards on that fatal day. He was employed to draw up the declaration to the neutral powers concerning the suspension of the king’s authority; but he is said to have regarded, with horror the fanguirnary spirit that was now predominant among the leaders of the Jacobins. Whilasm, indeed, he was ascending to the pinnacle of power, he seemed to have been the ardent advocate of insurrection and the revolutionary power: but as he found himself raised to that station, he began to insinuate “order and the constitution.” To him we may not unjustly apply that expression in Tacitus, which he cites against the anarchists in the national convention: “Rerum potiori volunt; honores, quos quiet est, publica desperant perturbationem, contenti fi poeae arbitrantur.” In the shocking massacre of the prisoners at Paris in September, he had probably no concern. When the “National convention,” the idea of which is said to have been suggested by him, assumed the direction of the state, and assembled on the 20th of September 1792, he was returned as member for the department of Eure and Loire, his native country. In this assembly, he openly avowed himself an advocate for a republican government, in opposition both to the Jacobins and Orleans; and was expelled the Jacobin club. On this occasion, he wrote a vindication of his public conduct, under the title of “An Address to all the Republicans.” He appears to have been shocked by the prospect of the fatal issue of the king’s trial, and to have attempted the preservation of his life, by deferring his execution, till the constitution should be perfected. The war with England, which soon followed the death of Louis, is ascribed to his ardour and credulity; for he was said to imagine, that the consequence of it would be a civil war in this country; and it is said, that this, as well as the war with Holland, was decreed in the national convention, Feb. 1, 1793, at his motion. This charge, however, he retorts on his accusers, and says, that the anarchists, by voting the death of the king, were themselves the authors of the war. See his “Letter to his constituents, on the situation of the national convention; on the influence of the anarchists, and the evils it has caused; and on the necessity of annihilating that influence, in order to save the republic.” English translation, No. 1794.

Briffot’s influence gradually declined; and his party was at length overpowered by a more violent and sanguinary faction, denominated the “Mountain,” so called, from its members usually sitting in the convention, on the upper seats of the hall, at the head of which was Robespierre, of execrable memory. The treachery and defection of Du- mourier likewise contributed to hasten the downfall of this party. To their imbecility or perfidy, the public calamities that threatened the country, were generally ascribed; and, after the establishment of the “Revolutionary tribunal,” for the purpose of trying crimes committed against the state, in March 1793, a petition was presented in the following month by the communes of the 48 sections of Paris, requiring, that the chiefs of the Girondists, or Briffots, denounced in it, should be impeached, and expelled the convention. In May and June, decrees of arrest were issued against them; and against Briffot among the rest, who attempted to make his escape into Switzerland. But he was stopped and imprisoned; and in the following October, he and 21 of his associates were brought before the revolutionary tribunal. Briffot, who was elevated in the midst of them, maintained a firm and tranquil mind; but, though their accusers could support their charges by little more than mere furnaces, the whole party was immediately condemned to the scaffold. This band of friends, among whom were several of the most virtuous public characters of the time, passed together an heroic night, and were next morning led to execution. “There Briffot,” says one of his biographers, “after facing the blood of 16 associates stream from the scaffold, submitted to the stroke, with the utmost composure, and thus expiated the political faults of his life.” Thence conformed, perhaps, more in vanity, enthusiasm, and precipitation, than in bad intentions; though he cannot be pronounced untainted with the vices, incomparable from a course of ambition. In the relations of private life, his character stands without reproach. Life of J. P. Briffot, said to be written by himself. Gen. Biog.

BRISSUS, in Natural History. See Echinus.

BRISTLE, a thick glossy kind of hair, wherewith the fwine kind more especially are covered. The name is sometimes also applied to the quills of porcupines, and the mullachs or whiskers of cats. Hogs’ bristles are hard, transparent, horny substan-ces, of a prismatical figure, without any appearance of cavities or pores in them, discoverable even by the microscope. Cats’ bristles have a large solid pith in the middle. Hogs’ bristles constitute an important article of exportation in Russia. In 1793, the value of those that were shipped off amounted to 742,000 rubles.

BRISTLE-dice, a sort of false dice, furnished with a piece of hog’s bristle stuck in the corners, or other places to hinder their falling on certain sides, and make them run high or low at pleasure.

BRISTLE-moss, in Botany. See Orthotrichum.

BRISTLED, in Heraldry, is a term used to denote the hair on the neck and back of a boar, which is usually of a different colour.

BRISTOL, in Geography. This second city of England is situated on the southern extremity of Gloucestershire, and the northern of Somersetshire, and once formed part of both counties. It is fasted principally on a peninsula between the rivers Frome and Avon, and lies in 51° 39’ N. lat. 2° 49’ W. long. and is in a bearing west 117 miles from London, and 12 from Bath. Various conjectures have been formed relative to its ancient and present name. Barrett, in his large history of this city, says it received the appellation of Caer-Oder at an early period; but is at a loss for the origin of Oder. Caer-Brito, its original designation, was evidently the generic name it obtained while a protected city of the Britons, under the Roman forces, which were stationed at Abone in its immediate vicinity. From this it was changed to Brightflow, or Brightflock, perhaps a translation of Caer-Brito; or it might have taken that name from Brightick,
Brightock, son of Aler, and great-grandson of Alfred, who was hereditary lord of the place. Its present name, Bristol, appears to have been derived from some early Latin words, taken from it by way of euphony, to Britolana, while that of the modern pronunciation, Bristol, is evidently an abbreviation made of pronouncing Brightock. It is a trade city, from an account which William of Worcester gives of it, and from the several names, it seems, that Bristol was founded, or rebuilt by Brenanus, son of Malvina or Denua, who reigned a king of the Britons 28 years, and was ancestor to the Christian race. In allusion to which, it is said, the names are placed over St. John's gate, in this city, emblematic of Brenamus and Belinus, who are said to have reigned constantly after the decease of their father. It is probable that a situation so eligible must have attracted every Briton, who therefore made it a place of associated habitation, previous to the Roman invasion;—however, it is certain that it was a place of importance during that period. In Consilid, as early as A.D. 430, reckons this among the fortified and eminent cities of Britain, under the name of Cas-Bristo. Nennius 410, A.D. 620, mentions it in his enumeration of 28 cities of Britain. On the decision of the island by the Romans, the Saxons overran the country and took possession of Bristol. Leland says, it was by them considerably increased; and also remarks, that St. Jordans, a disciple of St. Augilutne, went by pope Gregory to convert the Saxons to Christianity, preached the gospel at Bristol, where he died and was buried. Thus we had it a place of note at the end of the 6th century. In Domesday book, finnished by command of the conqueror in 1086, the inhabitants are styled burgesses. It was then increased in rate by no city, except London, York, and Winchester.

Early and present extent. The city, as first laid out at the conflux of the Frome and Avon, was, except on the northern part, where afterwards the castle was erected, inundated by these rivers. The ground sloped each way to the centre, forming a pleasant hill. It was divided into four transepted streets, and walled round after the course of the river for its better defence. At the end of each street was a fortified gate and a church, and four churches surrounded the castle at the centre of the city. In the late Bristol could not exceed a mile and a half in circumference. The conflux of people drawn hither by its growing trade soon extended it beyond the walls, both on the Gloucestershire and Redcliffe side of the Avon. Other walls and gates therefore would become necessary, and it was thus further defended, before the wooden bridge was built across the Avon. Leland mentions others, which he terms "Eternavc secunda mervia urbic." Indeed, the large and strong castle, with its outworks, when completed, as it joined closely to the old town and the buildings on the southern side of the river, inclosed also by a strong wall, were great additions to the city, and thus made its circumference at least two miles and a half. The accession of the monastery of St. Augilutne, with Caunt's church and hospital to the west, the priory of St. James to the north-west, and the purchase of the castle precinct, and laying it out in streets, added very considerably to the extent of Bristol, towards the close of the 17th century. Since that period most of the buildings have been erected, both in the city and suburbs, which bear a modern appearance, and these have been numerous, so that it may be truly said, that Bristol has increased, within the last 40 years, full a fourth. This city once formed part of the Saxon kingdoms of Wessex and Mercia; and after the whole of England was subjected to one monarch, and divided into counties or shires, constituted part of the counties of Gloucester and Somerset, though it was generally considered as belonging to the latter county. It was by royal

chatter, temp. Edw. III. made a county of itself; and by other different charters, its boundaries have been extended from time to time, till they now form a line on the Gloucestershire side, of 4 1/2 miles and 37 perches, and on the Somerset side 2 1/2 miles and 18 perches; the whole city is therefore 4 miles and 75 perches in circumference, and, taking in the suburbs from Lawrence-hill in the east to the Hot-wells in the west, is more than 5 miles in length. Its breadth, from Stokes Croft turnpike on the north, to Aston turnpike on the south, is upwards of 2 1/2 miles. The number of houses and inhabitants it is difficult to ascertain. In the late survey by order of government, the return from Bristol must have been very inaccurate, and is slatted at 10,896 houses, and 63,645 inhabitants. Anderson, in 1738, puts the latter down at 100,000, but gives no documents for this enumeration. The houses may be slatted on an average estimate at 17,003; and if the environs of Temple-forest, Lewin's-mead, College-place, Lime-kiln-lane, &c. be attended to, the rate of 7 to 1 house will not appear too high. This calculation, including those in hospitals, almshouses, &c. will bring it to about 135,000 persons, which will not far exceed the truth.

Public Buildings, &c. The buildings in the old part of the city are awkward, and the various alterations that have taken place at different periods have destroyed all uniformity. The city stands on very uneven ground, and very high walls are raised round most of the houses; but the enormous height to which they are often built, appears highly unreasonable, especially when it is considered that an enclosing wall has been known to coil the value of the house itself. This passion is declining, and Bristol can now boast some good and handsome houses, in the open streets, figures, &c. Among the principal buildings are the Cathedral, Redcliffe Church, the Exchange, Infirmary, Public Library, Theatre, Assembly-rooms, &c.

The Cathedral is only part of the original building, which was the church belonging to the abbey of St. Augilutne, founded by Robert Fitzhardinge, younger son of the king of Denmark, whose monument is still preferred within it. At the dissolution of the monastery, this noble building, then 350 feet in length, was partly demolished; but when the king determined to erect six new bishoprics, of which Bristol was one, and was informed there was enough of the fabric left for a cathedral, he put a stop to its further demolition; the western part being removed, it was left in that mutilated state in which it remains; the present fabric consists of the transept, the eastern part of the nave, and the choir. At the time of its foundation it is a large square tower, highly ornamented and crowned with battlements and four pinnacles. The present church, from east to west, is 175 feet; its breadth of transept, from north to south, 128 feet; the breadth of nave and aisles 73 feet, and height of the tower 140 feet. The establishment is a dean, six prebendaries, four minor canons, faciels, &c. and service is performed twice every day.

The Church of St. Mary Redclife, says Camden, "is like a cathedral, and on all accounts the first parish church in England." It was founded in 1292 by Simon de Burton, who was six times mayor of Bristol. According to the mayor's calendar, this church was finished A.D. 1376, and was then celebrated for its architecture all over England. The tower and spire were 250 feet high; but in 1415 a terrible storm of thunder and lightning destroyed part of the spire, and the church was much damaged. The latter was repaired by the munificence of Mr. William Canning, merchant, but the spire was never rebuilt. The church stands on an eminence, called Redcliffe-hill, and is built in the form of a cross. The nave rises above the aisles, is lighted by a series of lofty windows on each side, and is supported by flying buttresses. The tower is large, and with the remain-
The spire, richly ornamented with carved work, and also a variety of niches and statues. Though a lofty and massive building, yet, from the peculiar beauty of its masonry, it has a light and airy appearance both without and within. The roof, nearly 60 feet in height, is arched with flone, and ornamented with various devices. The church, including our lady's chapel, is in length 239 feet, and the transept, from north to south, 177 feet. The breadth of the nave and aisles is 59 feet, and at the crofs, nave and aisles, 114 feet. The height of the aisles both direct and transept is 25 feet. The height of the nave is 54 feet. St. Mary's chapel has been separated from the church, and is used as a grammar-school. A peculiarity observable in Redcliffe-church is that the transept consists of three divisions, or aisles, similar to the body of the church, which has a fine effect when the spectator places himself in the centre of the building, and looks around him. Besides the above, there are 15 other parish churches in Bristol, some of which are modern structures. Temple church is rather curious, and its tower is out of the perpendicular. There are also 22 chapels, or places of worship for dissenters of different denominations, and 5 chapels of the established religion.

The Exchange, finished and opened in 1743, was built by Wood, the architect of Bath, at an expense of £50,000. It is a handsome building, in the Grecian style, 110 feet in front, and 148 feet in depth. The principal front is upon a bold rusticated basement, the central part of which makes a tetrastyle of almost whole columns, with Corinthian capitals, supporting a pediment, in the tympanum of which are the arms of England carved in flone. The place intended for the merchants is a peristy of the Corinthian order, 50 feet by 80, and capable of containing 1440 persons.

The General Hospital, for the reception of all cases, and all persons of whatever nation, is a handsome edifice, though it has unfortunately never been yet completed.

The Theatre-royal, King-street, is a peculiarly neat and convenient structure: indeed, Mr. Garrick pronounced it to be the completest in Europe of its dimensions; and he wrote a prologue and epilogue, which were delivered at the opening, May 30th, 1766.

The Bristol City Library, so called, because part of its collection belongs to the corporation, and the greatest part to a society of gentlemen. It contains an excellent assemblage of ancient and modern books, which, by donations and annual subscriptions, are rapidly increasing. They are contained in a large freestone building erected for the purpose, with a convenient house for the head librarian, who has also an assistant librarian.

The Assembly-room, in Prince's-street, has a beautiful front of free-flone, confiding of a rustic basement, with a central projection supporting four Corinthian columns, coupled and crowned with an open pediment. On the frieze, in relief, is the following motto: "Curas cithara tollit," Music dispels care.

To these may be added, the Civil Hall, where the scribes, sealing, and other public business are transacted.

Government, civil Officers, &c.—The original government of Bristol seems to have been mixed, military and civil; the chief authority residing in the lord constable of the castle, who deputed another officer for the execution of justice, called "prepositus ville," or provost of the town. The earliest account of this officer occurs in Domeladay-book. In the reign of king John, Bristol obtained a charter to be governed, like London, by a mayor, &c. From the Annals, it appears, that the civil government, at different periods, has been variously modelled, as appears from the following list:

1. Till A. D. 1205. A prepositus under the curtains of the castle.
2. 1260. A mayor and two prepositi.
3. 1313. A mayor and two serjeants.
4. 1372. A mayor and two bailiffs.
5. 1500. A mayor, sheriffs, and two bailiffs.
6. To this day. A mayor and two sheriffs chosen annually.

The government of the city is now administered by a mayor, a recorder, twelve aldermen, who are all justices of the peace, two sheriffs, an under-sheriff, twenty-eight common-council-men, town-clerk, deputy town-clerk, chamberlain, vice-chamberlain, stewards of the sheriffs' court, clerk of the arraignment, registrar of the court of conscience, and also a high steward. There are other officers pertaining to the corporation, as sword-bearers, two coroners, water-bailiffs, quay-masters, school-masters, clerk of the markets, keepers of the prisons, inspectors of nuisances, fire-wards at inn, esquires of the court, common-crier, exchange-keeper, sheriffs' officers, club-men, city marshal, and a band of musicians in constant pay. Great form is observed on the 15th of September, in the election of mayor, when the whole body corporate is convened. He is allowed £100. for the year of his mayoralty, and the sheriffs £50. each for the year of their vice-chancellor. The mayor has the highest marks of honour granted to magistracy, scarlet ermine gowns, sword, nave, cap of maintenance, &c. He holds a daily feflamm in the council-house to hear complaints and accommodate differences, courts of conscience, and pie-power, quarterly seifions, and a general jail delivery twice a year: one for the decision of civil, and the other of criminal causes, wherein the court has the power of life and death. The mayor, aldermen, and common council have the custody of the city seal, which is imprefsed with the city arms. These are gules, a cable on a hill by the sea-side, and the helm of a ship plying by, all proper; to which were afterwards added two unicorns as supporters. The motto is, "Virtute et Industria."

From the time Bristol was made a county of itself, it has, by various charters, and grants, been endowed with additional privileges and immunities, all of which were confirmed by a new charter from queen Anne. By another of king Edward IV. 1461, Bristol was exempted from the authority of the high admiral of England by land and water; and the right of determining differences, belonging to the court of admiralty, was referred to the mayor and corporation. The jurisdiction by water extended up the river only to lower Harrow, till an act of William carried it to Hanham; thence it reaches to King-road and down the channel to the Flat-holmes. To this place, Gildas, the ancient British saint and historian, retired, and here he died. The opulent corporation of Bristol is politicised of large estates, both in the city and in the country; and they are the patrons of several church livings, so that they not only possess great influence, but have it in their power to encourage genius, and reward industry and merit. The city is divided into twelve wards, each of which has an alderman to preside over it. The recorder is always one of the aldermen, and by virtue of his office, the principal. The senior alderman, as in London, is called the father of the city. Every ward has one chief constable, and twelve others, a night constable, and a proper number of watchmen under him.

Bristol contains three prisons: Newgate, at the end of Wine-street, which is a gaol for malefactors and debtors; Bridewell, or the city prison, for the confinement and correction of felons; and at the end of Gloucester-street is a prison, on Howard's plan, for that part of the suburbs...
which stands in the county of Gloucester, and a Bridewell on the Somerset side. The act for lighting Bristol with lamps was procured in the reign of William III. This obliged the citizens to hang out their own lamps; but they are now provided, and the lighting contracted for, by the different parishes. Most of the streets are well paved on the sides with flag stones; but the pitching with pebbles in the carriage-way is at present extremely uneven and bad, and requires amendment. The poor rates are separably assessed, and collected on the respective parishes; but the poor are taken care of conjointly, and have a house called St. Peter's Hospital. There are fourteen flanks of hackney coaches in various parts of the city, and one at Dowry Square. Each coach is numbered, and marked C. B. There has lately been instituted at Bristol a society for the suppression of vice.

Bristol appears to have been a borough at the Conquest, and at a very early period, by ancient predestination, sent two burgesses to parliament. A list of its representatives is still extant from the 23d of Edward I. 1295. None can vote for members but such as are free of the city, which freedom is attained by servitude, by hereditary right, by marrying a freeman's daughter, or by purchase. The number of freemen, at present, is about 8000. The city gives title to an earl, and the earldom was formerly in the noble family of Digby, but is now in that of Hervey.

Commerce, Trades, Shipping, &c.—That a port so situated as Bristol should have early participated in the commerce of the country, can be no matter of surprise. William of Malmbury, in 1139, says, it was a place much addicted to trade, and was then full of ships from Ireland, Norway, and every part of Europe, which brought hither much commerce, and great foreign wealth. From the charter of King John something may be learnt of the commerce of the place in his reign, but more will be furnished by that of Edward III. Bristol was grown so opulent in 1327, that the mayor and commonalty lent the king (Richard II.) 500 marks, which is the first instance (except London) in the Fledera of a lay community lending money to the crown; and, in future loans, we find Bristol follow London. In 1487, a petition was presented to the king, to empower the citizens of Bristol to remove all obstructions in the river Avon that impeded its navigation between Bristol and Bath; for before the time of Richard I. the Avon was navigable to Bath. In 1711, an act of parliament was obtained, at an expense of 15,000l. to amend this navigation by placing wears, locks, and other obstructions. In the roll of the fleet of Edward III. which was at the siege of Calais, in 1347, we find the proportion of ships and men furnished, on that occasion, by London and Bristol: the former supplied 25 ships, and 662 men, and the latter quota was 22 ships, and 568 men. William Cannyngs is dillingshewed as a great merchant here in 1442, and he appears to have traded with peculiar privileges, to Prussia, the Hafnetic towns, and Denmark. William of Worcelter says, that Cannyngs employed for eight years, in his own shipping concerns, 800 men, and he specifies the ships and tonnage employed by him. The same Cannyngs paid king Edward IV. 4000 marks for his peace, i.e., for leave to trade to prohibited places, and to be free of imposts and duty.

The commercial character of the Bristol merchants will be best apparent from the letters patent which were granted to John Cabet, a Genoese by birth, but a resident merchant in this city, and to his three sons, who fitted out vessels for the purpose of discovery. In 1527, Robert Thorn obtained leave to go on a voyage of discovery, to find out a north-west

pillage. In 1593, Sir Humphrey Gilbert performed a voyage for the colonization of America, an account of which is given in Hakluyt. Many other voyages were afterwards made from Bristol, with the like public-spirited views, though not with equal success. The merchants had, previous to 1526, traded to St. Lucas in Spain, and thence to the Canaries, finding out cloth, soap, &c. and bringing in return sugar, drugs, dye-stuff, &c.; and De Wit, in his interell of Holland, says, this city very early engaged in the cod-fishery on the coast of Newfoundland, and also entered into the West Indies trade soon after the discoveries were made. In 1556, the merchants were incorporated into the society called Merchant Venturers; and various grants, immunities, and franchises, were annexed to their society. Seaball Batb was constituted the first governor. In 1588, four ships were fitted out from Bristol to join the Queen's fleet at Plymouth. With regard to the present state of trade, it is very considerable to Florida, Carolina, Virginia, New York, Newfoundland, Quebec, Spain, Portugal, West Indies, Denmark, Sweden, Russia, Prussia, &c. The ar

dour for the African trade seems much to be abated; and the Bristolians now yield the palm of traffic in human beings to the rival port of Liverpool. The merchants in Bristol trade with a more entire independence on London than any other port in Britain. Whatever exports they make to any part of the world, they can import the full returns, and find a market, without confounding their ships or cargoes to London. They have buyers at home for their largest importations, consequently the shopkeepers of Bristol, most of whom are wholesale dealers, keep up a great inland trade, having riders and carriers, like the London merchants.

The quay of Bristol, which was commenced where the bed of the Frome was altered, reaches round from the stone bridge on the Frome, to the new handsome bridge over the Avon; in extent one mile, being one uninterrupted wharf of hewn stone, with sufficient depth of water, at flood tides, for the largest ships to ride close to the walls, and discharge their cargoes. These, as the tide ebbs, ride safe at their moorings on a soft oozy bed of mud; but foreign and sharp keeled ships are often strained, and obliged to go into dock after lying here. This occasioned a new floating-dock to be made, at the expense of 20,000l. It is situated near the Hot-well-road; its gates will admit a 4-gun vessel, and it will contain 40 sail of shipping. Here also are dry and wet docks, for repairing and building ships. A scheme has long been in contemplation to dam up the water, and keep the vessels in the harbour conffantly afloat. In 1803, an act of Parliament was obtained for the purpose, a plan was adopted, and this great work is now executing with all possible expedi

ion. When completed, the port will be capable of holding 1000 sail of shipping, which convenience must, eventually, be of great advantage to the city. The plan is to dam up to a certain height the whole of the present bed of the Avon and Frome, and to make a new channel for the river through Redcliffe meads. Three hundred thousand pounds are already subscribed, and three years given to accomplish the design. From what has already been done, it is conjectured that the expenditure will not exceed the estimate; and if workmen can be obtained, it is presumed that it will be finished within the affixed period. By this plan, ships will not only be kept afloat at the quays, but may enter the locks, and go to sea at high tides, which will be a wonderful saving in time and expense; and a navigation will be opened up the Avon, as high as the town of Keynham, in one level: the money to be raised by duties and taxes, bearing an interest of 4 per cent., and not exceeding 8 per cent. The interest is to be raised by a tax on houses in the city, of
one shilling per pound rent, and a port-duty on all goods and merchandise imported. The tax on houoses is considered to be partially to be just; and the duties on articles imported may probably act as a considerable prohibition on foreign vessels frequenting the port. Time alone, however, must disclose the policy or impolicy of thus raising the sum necessary for its accomplishment. The trade of this port has been ever fluctuating from the time of Henry II. 1157, (when William of Malmsbury makes such favourable mention of it) to the present time. Every vessel of above 60 tons burthen pays a certain wharfage; and from the water-bailiffs' returns, it appears that, in 1745, it amounted to 915L 18s. 7d.; in 1775, to upwards of 2000L. In 1742, the privateers fitted out from Bristol, according to Barret, exceeded in tonnage, number of guns and men, the whole royal navy of Great Britain. In 1769, there were entered inwards at the Custom-house 427 foreign ships, exclusive of Londoners, Coalters, &c.

In 1787 the entry at the custom house was as follows:

After this period the trade increased considerably; and another computation states, that in 1788, 54 ships were employed to Jamaica, 38 to the Leeward islands, 37 to Africa, 33 to Newfoundland, 50 to North America, and 200 between Bristol, Ireland, France, Spain, London, &c., amounting to 1522; besides 102 trows from 50 to 130 tons burthen, employed in the Severn and Wye trade. But the commerce of Bristol received a severe check during the late war; and the present paralyzes the spirit of adventure, and the hand of industry. Should peace quickly return, and the port be finished, there can be little doubt but this place will become more flourishing than ever.

Besides the foreign trade, Bristol has many very considerable manufactures; and the cheapness of fuel, with the ready conveyance to a market, renders this an advantageous place for carrying on various trades. The brass rollery business was begun here about 1704. The manufactory of zinc out of calamine stone, and the ore of zinc called black Jack, was established at Bristol in 1743, for which Mr. Champion obtained a patent. Mr. Emerson at Hanham established works for making brass, by exposing copper to the flames of calamine, and obtained the finest brass in the world. Vide Watkin's Chemistry.

The glafs houses of Bristol are not only numerous, but great quantities of different glafs articles, and bottles, are annually made here. This trade is increasing, and it is said that more glas is manufactured at Bristol than at any other place in England. Many large iron foundries are also established here, and a steam-engine factory is erected for boring cannon; smelting lead, and making of white and red lead, are among the manufactories of this city.

There are 20 sugar-houses for the refining and manufactury of sugars; several large distilleries, which help to supply London; and the exportation to foreign parts is very considerable. The manufacture of soap has long been an article of great trade here; for, in 1525, it supplied London with the best grey speckled soap at 1s. per pound; but it is now 1s. Large quantities are still sent to London, to most parts of the kingdom, and to America. This place was, at an early period, noted for its woollen trade. In 1339, we find from Rymer, that the cloth manufacture was removed from Flanders, when Bristol was appointed a principal staple of wool, and many brooms were let up for weaving woollen cloths. In Henry VIII's reign, it was full of clothiers, weavers, and tuckers; and the magistrates gave great encouragement to set up the Colchester rug manufactury, and many sums have at times been left to the corporation in trust for the use of young clothiers. This trade is not entirely taken away, as some woolen fusts, ferges, &c. are still made. The manufactury of silk fringes, fall cloth, cottons, morocco-leather, &c. must not be omitted. Several potteries also now rival those of Staffordshire.

Military History, Cloth, &c.—It is highly probable, that so conspicuous and important a place early partook of the dissipations arising from the internal commotions of this kingdom, and the evils arising from foreign invasion. But history is silent, the records being lost till 915, when Stow says, a great navy of Danes failed up channel and infected the western coasts, landed in divers places, and took great plunder; at which time Bristol suffered from the marauding enemy. King Edward son of Alfred, 911, according to the Saxon annals, sent his army out of Mercia, and met them in Welfois, where he fought and routed them. The battle was decisive, and the Danes were then subject to the Saxon monarch. Edward went on to build towns and castles; and amongst others he built that of Bristol, on the Mendips side of the river Avon. Camden, therefore, was evidently mistaken when he affirms that Robert Rufus, natural son of Henry I., was the founder of the castle of Bristol. Turgot mentions it as the work of Edward in 915, and says, it was "the goodliest of five built on the banks of Avon;" and in 1088, it is mentioned by Roger Hoveden as "Caftre fortifiematic." and if it were 100 years after the conquest, there cannot be a doubt, but it previously existed as a fortres for the defence of the city. Another decisive proof of Camden's error is, that the castle was held by Godfrey bishop of Conisbrough, and Robert de Mowbray earl of Northumberland, in a rebellion against king William Rufus in 1088; before king Henry I. earl Robert's father, was at man's citate. This early, though not the founder, certainly rebuilt some parts, repaired other, and erected a palace and other offices. He also built a magnificent tower, fearlessly equalled at that time in England, and encompassed the whole with strong walls. Leland informs us, that Robert built part of it, and that "the dungeon tower was made of stone brought out of Normandy by the red earl of Gloucester." It was not till 1130, that earl Robert began to rebuild and improve the castle; which, excluding the out-works, was 450 feet from cast to west, and 300 feet from north to south. There were in it two great courts, many towers, a church, and a magnificent chapel. The king had also a palace within the walls. The principal buildings stood upon an area, covering 33 acres of ground, exclusive of courts, yards, and other accommodations for the officers and the garrison. Leland informs us, that the great tower flood in the north west part of the castle; and in his time, about 20th of Henry VIII., the whole was in a decayed state, and tending fast to ruin. In the reign of John, the castle was annexed to the crown; and here that monarch cruelly confined the princes Eleanor, (called the damsel of Brittany,) who, after forty years miserable confinement, died here in 1244. In the baron wars, during the reign of Henry III., p. ince Edward his son supplied the castle with provisions, and fined the townsmen.
tions were made for not affiding him with supplies. The latter besieged him in the castle, and the prince fled to Windsor, where he was soon forced to accept terms at the head of the haven. When the duke of Lennox opposed, however, the inhabitants of Bristol threw open their gates to the invading forces, who stormed and took the castle, in which many of the king’s friends had taken refuge. The inhabitants of Bristol’s father displayed the Earl of Richmond, afterwards Henry VII, at which time Duke d’Aubigny held the castle. During the restoration, tunnies broke out in the west, and at Bristol, the castle, walls, and gates of the city were repaired and mounted with cannon; but by the prudent conduct of Mr. William Chetler, the discontent were soon appeased, and a general pardon was procured for the delinquents. In the years 1545 and 1553, a mutt was established in the castle; and the church plate, seized by the commissioners, was here coined. By a petition to king Charles I, 1620, the king granted the castle and its appurtenances to the mayor and corporation of Bristol, and made it a part of that county and city; and in 1631, it was sold to the mayor and burgesses for £50. In the commencement of the war, between the king and his parliament, the castle was repaired and garnished by the parliament-army, under the governor Col. Nath. Fennes. This was considered a place of the greatest consequence, and forced to awe all the western counties, having accommodations for a large army. The king, therefore, was very desirous of obtaining possession; a plot was formed by Yearmans and Boucher, to deliver it up to the king’s forces; but this being discovered, prince Rupert, at the head of a considerable army, beleaguered it; but fearing the length of a blockade, he determined to take it by force, which he quickly effected. But the place was thus dearly bought, for the king lost most of his valuable officers, and more than 500 of his best troops. It was thought of so much consequence, that a public thanksgiving was ordered for the success of his majesty’s army. The citizens subscribed £1,400 to prevent the plunder of the powder; and orders were consequently given for death to the penalty of plunder. Bristol was ordered to pay £5,000 in money, and cloths and equip 1350 of the king’s soldiers. At the battle of Naseby, Prince Rupert repaired to Bristol, which he found supplied with men, provisions, and ammunition, so that he wrote to the king, assuring him he was able to sustain four months’ siege. This revived the hopes of the king’s party; and it was thought that the prince would make a vigorous and desperate defence; but, to the surprise of all, he made but a very feebile and short resistance. This unexpected and disordered event damped the royal cause, which from that day rapidly declined; and certainly the capitulation of this grand ilation hastened the fatal catastrophe of the king’s submision, and subsequent decapitation. After Oliver Cromwell was proclaimed protector, he issued orders for the demolition of the castle of Bristol. The dismantling was begun in 1665, and the whole was razed to the ground. Scarcely any vestiges are now remaining. Thus this fortress, deemed impregnable in former ages, and which has made such a distinguished figure on the page of history, the subject of so much negotiation, and so much contention, was destroyed after having weathered the storms of seven centuries. The inhabitants, previous to this period, appear to have always been in opposition to the reigning princes, but subseqently, however, the reverse appears the case. In the duke of Monmouth’s rebellion, they espoused the cause of king James. During the rebellion, in the reign of George I, and especially in 1745, they were decidedly for the house of Hanover; and in the present day their exertions in defence of the nation are too well known to need a comment.

Such are the most material places, objects and events, connected with the city of Bristol. We may further state that its buildings cover an area of about 1600 acres of ground, and the suburbs above 500 more. With the appendages it contains 600 streets, squares, lanes, courts, &c. in which are erected 47 churches and chapels. Here are 5 hotels, 50 inns and taverns, 7 banking houses, and 4 prisons. It is the chief city, quay, and mart of the western parts of the kingdom, and is cuffed among the principal cities of Europe.

Bristol is the birth-place of many distinguished literary and public characters, the memoirs of whom will be introduced under their respective heads. We shall therefore only mention the names of the principal: Thomas Chatterton, poet; Sir William Draper, William of Worscest, William Canynges, Edward Cellon, Ann Yeandle, Mary Robertson. For an account of the Hotwell’s, Clifton, St. Vincent’s rocks, and many places in the vicinity, see Clifton. Barter’s History of Bristol, 4to. 1789.

BRISTOL, a township of America, in Lincoln county, and district of Maine, containing 1718 inhabitants; 204 miles N.E. from Boston.

BRISTOL, a county in the southern part of the state of Massachusetts, situate to the east of a part of Rhode island; its principal town is Taunton. It has 15 township’s, 973 acres of improved land, 130,967 of that which is unimproved, 31,700 inhabitants, and 17,860 head of cattle.

BRISTOL, a county in the state of Rhode island, bordering on Bristol county in the Massachusetts, north; and mount Hope bay, call, and including the townships of Bristol, Warren, and Barrington. The number of inhabitants is 3211, of whom are 682 slaves.

BRISTOL, a sea-port town, and capital of the preceding county, lies on the western side of the peninsula, called Bristol neck, and on the east side of Bristol bay; including Popaquinsh- neck, and the whole northern and eastern parts of Bristol neck to Warren, north; and to mount Hope bay, east. Its distance, including the ferry, about half a mile broad, is about 3 miles from Rhode island, 43 miles from Newport, 24 S.E. from Providence, and 63 from Boston. Although it has suffered greatly by the ravages of war, it is now in a very flourishing state, having 1400 inhabitants, including 64 slaves. Its situation is beautiful; its climate healthy; its soil rich; and its harbour safe and commodious. Onions, in considerable quantities, and a variety of provisions and garden stuff, are raised here for exportation. N. lat. 41° 45’, W. long. 71° 20’.

BRISTOL, a township in Hartford county, Connecticut; 16 miles W. of the city of Hartford.

BRISTOL, a town in Bucks county, Pennsylvania; 11 miles S.S.E. from Newtown, and 20 N.E. from Philadelphia; seated on Delaware river, opposite to Burlington in New Jersey, and containing about 50 or 60 houses. It is noted for its mills of various kinds. N. lat. 40° 17’, W. long. 75° 58’.

BRISTOL, a township in Philadelphia county.—Allo, a small town in Charles county, Maryland.—Allo, a township in Addison county, Vermont, call of Vergennes, having 211 inhabitants.—Allo, a new town of New York, in Schenecro county, incorporated in 1797.

BRISTOL Bay and River, lie on the north-west coast of North America; the north point of the bay is Cape New- him, and the south point is Cape Oenemak, on the peninsula of Alaska. These two points of the bay are in N. lat. 54° 30’ and 58° 42’, and in W. long. 162° 24’ and 163° 20’.

The
The river, which runs into the bay from the east, is about a mile broad at the entrance, and has plenty of salmon. N. lat. 58° 27'. W. long. 158° 5'. The variation on this coast is nearly 29° E.

**Bristol Bay**, a bay on the S.W. coast of Nova Scotia. N. lat. 44° 41'. W. long. 63°.

**Bristol Cape**, lies in Sandwich island, 8 leagues N. from cape Montague, and E. from Freeland peak. S. lat. 59° 2'. W. long. 26° 51'.

**Bristol Channel**, the estuary or wide frith of the Severn, is that part of the Atlantic Ocean, which lies between the south coast of Wales and the counties of Somerset, Devon, and Cornwall, in England.

**BRITISH ISLES**, in fortification, a line of four or five fathoms, which is allowed to the captain and oriflon, to make the hollow tower, or to cover the concealed flanks.

**BRITISH, in heraldry**, is the mark of distinction of houses or families, when borne as such on a bend, fesse, &c.

**BRITAIN**, Great, the most considerable island of Europe, comprehending the two kingdoms of England and Scotland, with the principality of Wales, and extending from Lizard point, N. lat. 50° nearly to Dungby-head in N. lat. 58° 30' nearly. Accordingly, its length is about 500 miles. Its greatest breadth from the Land's End, in W. long. 5° 45', to the north Foreland, in E. long. 1° 17', is about 488 miles. Its form, however, is somewhat triangular; as it has three promontories, projecting in different directions, viz. the Land's End, in Cornwall, towards the west; the North Foreland, in Kent, towards the east; and Dungby-head, in Caithness, towards the north; and the circuit of its three sides, allowing for the windings of the coast, contains, by a general estimate, about 1500 miles.

But if Great Britain were considered as a perfect triangle, the length of its three sides would measure about 1500 British miles. It is bounded on the north by the Northern Ocean, on the west by the Atlantic and the Irish Sea, which separates it from Ireland, on the south by the British Channel, which divides it from France, and on the east, towards Germany, by the North Sea and German Ocean.

Some have supposed, that Great Britain was, in times of very remote antiquity, united with the continent. The entire separation of Great Britain from the continent must have happened, according to the conjectures of Mr. Kirwan, (Irish Tranfact. vol. vi. p. 301.) long after the deluge, and that of Ireland from Great Britain at a still later period; for wolves and bears were formerly found in both, and these must have passed from the continent into Britain, and hence into Ireland, as their importation cannot be suspected. The divulsive force that separated Britain from Germany seems, according to this writer, to have been directed from north to south, but gradually weakened in its progress. Hence that island is sharpened to the northward; but the impression must have been considerably enfeebled by the opposition of the granitic mountains that form the Shetland and Orkney isles.

The broken structure of the calcareous or argillaceous and arenaceous materials of the more southern parts prevented lfs falience, were more easily preyed upon, and gave way to what is now called the German Ocean, while these materials themselves were spread over Wealtphalia, &c. or formed the subsoil of Flanders, Holland, and the sand-banks on its coast. The rupture of the illusus that joined Calais and Dover was probably effected by an earthquake at a later period, and gradually widened by tides and currents. Ireland was protected by Scotland from the violence of the northern shock; and hence its separation from Scotland appears to have been late and gradual. That from England was probably diluvial, and effected by a southern shock. These changes, says this writer, happened at least 3600 years ago. But to return from this digression.

The fertility and pleasantness of Great Britain gave occasion to imagine, that there were the fortunate islands, described by the poets, where the face of nature exhibited a perpetual spring. In former times this was the granary of the western empire; from hence was transported every year an immense quantity of corn for the supply of the army on the frontiers of Germany. As to the history of its more cultured, its population, fertility, and a variety of other circumstances relating to it, we refer to the next article.

The climate of Great Britain is, perhaps, more variable than that of any other country on the globe; and this circumstance has been ascribed to the opposition between the vapours of the Atlantic Ocean, and the drying winds from the central continent. The western coasts are subject to frequent rains; and the eastern part of Scotland has a clearer and drier temperature than that of England. The humidity of the climate, whilst it invades the delicious vales and meadows with a verdure unknown to any other region, injures the health of the inhabitants, by occasioning colds and catarrhs, which too frequently terminate in consumptions, that are fatal to many in the prime of youth. Besides, the moist and foggy climate confuses, with the excellence of groat animal food, to produce that melancholy, which foreigners have considered as a national characteristic of the country. To the mutability of the climate we may reasonably ascribe the precariously of the fashions. To this purpose it has been observed by some judicious persons, that since the year 1775, a considerable change has taken place, with regard to the temperature of the year, both in Great Britain and Ireland. The winters have been, in general, more moist and mild, and the summers have been more dry and more cold, than the average of preceding years. With us the year might not improperly be divided into eight months of winter and four of summer. The spring dawns in April, which is commonly a mild month, but eastern winds prevail in May, and check the efforts of reviving nature, and disannihilate the promise of the year. June, July, August, and September, are usually warm summer months, with occasional frosty nights even in August, and clouded wind; and some summers have of late years been chilled by constant rain. Our winter commences with the beginning of October, which, however, is often a mild and pleasant month; severe frost does not commonly occur till Christmas. November is the most gloomy month of the year; and allowed, generally, to be the most unsettled month, interspersed with dry frost, cold rains, and strong winds, with storms of hail and sleet. But all observations of this kind must be considered as general in their nature; and counteracted by different situations with regard to latitude, and by a variety of local circumstances.

The population of Great Britain has been variously estimated; some reckoning it at 7,200,000, and others at more than 12,000,000. But in the year 1800 an act was passed, (41 Geo. III.) "for taking an account of the population of Great Britain, and of the increase or diminution thereof." From an abstract of the returns made to parliament, in consequence of this act, the following result was deduced:

**SUM.**
On this enumeration it is observed, that the total population of Great Britain probably exceeds the number of persons specified in the above summary, in as much as from some parishes no returns were received. From the number of houses in Ireland, nearly ascertained by the collection of a hearth-money tax, it has been computed, that the population of that part of the united kingdom somewhat exceeds four millions of persons. It should also be observed, that the islands of Guernsey, Jersey, Alderney, and Sark, the Scilly islands, and the Isle of Man, were not comprised in this enumeration; and that the total population of these islands has been usually estimated at about 80,000 persons.

On these considerations, with a very moderate allowance for omissions in the returns, the total population of the united kingdom of Great Britain and Ireland amounts to fifteen millions one hundred thousand persons; and besides these, its eastern and western possessions and colonies contain many natives of the British isles. On a more enlarged survey of these colonies and settlements, we may consider their inhabitants either as subjects of Great Britain, or as augmenting its importance by their intimate connexion with it. The most important of these are now in Asia; and in Hindostan, the nations subject to Great Britain cannot be now calculated at less than 40 millions. The acquisition of the Dutch settlements, the colony of New Holland, and more minute settlements, must also be taken into the account. In America, and what is called the West Indies, Canada, Nova-Scotia, Newfoundland, and the more northern settlements, with Jamaica, and the other islands, may, perhaps, contain a million. In Africa, the settlements at the Cape of Good Hope, the islands of St. Helena and at Sierra Leone, present an insignificant number; and Gibraltar is to be regarded merely as a military station. However, if we compute the North American states, detached from the mother country, at a population of five millions, the united kingdom of Great Britain and Ireland at 15 millions, and our colonies and settlements at only two millions, we shall find in the various countries of the globe an increasing population of 22 millions, diffusing the English language and manners to a vast extent, and contributing in one way or other to the wealth, power, greatness, and prosperity of Great Britain.

From the above table it appears, that the enumeration of 1801 amounts to 8,872,080 persons for England and Wales; and to this number an appropriate share of soldiers and mariners is to be added. These appear to have been 469,188; and if, exclusive of them, the total population of the British isles is 14,630,812, (15,100,000 - 469,188) about a thirtieth part may be added to the inhabitants in order to ascertain the population of any distinct part. Accordingly, in the following table, the existing population of England and Wales is taken at 9,168,000; and the population attributed to the other years, is obtained by the rule of proportion, thus: if 255,426 baptisms (the average medium of the last five years, deduced from the returns of parish registers,) were produced from a population of 9,168,000, from what population were 152,540 (the baptisms of 1700, given in the same returns) produced?

</table>

Upon a view of this table it may be observed, that although the beginning of the century exhibits a decreasing population, the lost number had been regained in 1720; and since that time a continual, though irregular, increase is manifested. It also appears, that the population of England and Wales, in 1801, compared with that of the beginning of the last century, is as 1,000 to 597, or nearly as ten to six. The following table for Scotland is formed in the same manner; but being founded on a collection of no more than 99 parish registers, from different parts of the country, it is of much less authority. These parishes contain less than a seventh of the whole population. In Scotland there are in all about 900 parishes.
The population of Scotland, in 1801, compared with that of the beginning of the last century, appears to be as 1,000 to 634, or nearly as 10 to 61, which, as the 99 parish registers were received from the manufacturing parts of Scotland, gives too high a statement of the increase of population.

In the year 1695 a poll-tax was levied in Ireland; and on that occasion it was calculated, that the number of inhabitants was 1,034,000; but the usual evasion of taxation may be supposed to have considerably increased the real number. About the year 1795, Ireland contained, at least, 4,000,000, and since that time the number has not increased. However, it may not be very erroneous to estimate the population of Ireland at 1,500,000 in the year 1700, and at 4,000,000 in the year 1801. If this be granted, the population belonging to all the British Isles has increased during the last century from 8,100,000 to 15,100,000.

Of the population of Great Britain, the army has, of late years, engrossed a considerable share. It consists of regulars, in cavalry, and infantry, and the militia, exclusive of artillery and engineers. The volunteer corps in Great Britain and Ireland amounted in December, 1803, to 43,500; and on the 1st of January, 1805, the secretary of war made the following return of the state of the British forces at home, and on foreign stations, viz. 21,223 of cavalry, including 1,083 horse artillery; 8,559 of artillery; 124,878 of infantry, including 20,747 men for limited service, and 21,203 men belonging to foreign and provincial corps in Great Britain; and 89,809 of militia: so that the whole British force, in regulars, militia, and volunteers, amounts to 67,449 men.

To these we may add the royal regiment of artillery, the horse brigade, the brigade of gunners and drivers, and companies of foreign artillery, amounting on the 1st of January, 1805, to 16,070; and the corps of royal artillery, artificers and labourers, including, at the same period, 704 men.

But the great rampart and supreme glory of Great Britain consist in her navy, in size, strength, and number of ships, far exceeding any example on record. In 1805, the total of ships in commission amounted to 683, consisting of 111 of the line, 19 fifties to forty-fours, 132 frigates, and 404 ships of various kinds; besides several repairing, in ordinary, and building: amounting to the whole in the number of 897. For this immense fleet, the number of seamen, annually voted, amounts from a hundred to a hundred and twenty thousand; a number which no other country ancient or modern could have supplied. To support the expenditure occasioned by the army and navy of Great Britain, to defray the other charges of government, and also to discharge the interest of the national debt, a very large sum is raised by a variety of taxes, in aid of the revenue, arising from the excise and customs. The ability of the country for bearing the burden which its exigencies impose upon it, consists in the produce of its land and manufactures, and in the circulation of property, occasioned by its domestic trade and foreign commerce. These sources of national wealth have been improved to an astonishing degree in the course of the last century and a half. Availing ourselves of the estimate of the national wealth of Great Britain, furnished by Mr. Grellier, in an ingenious work, written in one of our periodical publications (Monthly Magazine, 1789, p. 124), we shall subjoin the following statement of its value in the year 1770, 1780, and 1790, which Mr. Pettie estimated the wealth of England at the sum of two hundred and fifty millions. His computation is subjoined.

</table>

But since the time when this computation was made, a great difference in the value of money has taken place, which difference appears from the table of Mr. George Shuckburgh Evelyn, in the Philos. Trans. for 1798, part 1, page 177, to be in the proportion of about 5 to 14:1; and, therefore, the total wealth of England and Wales, in 1804, would have amounted to 750,000,000l. according to the present value of money.

The value of land has progressively increased, in consequence of improvements in cultivation, and the increased consumption of its produce, from 18 years' purchase, at which Mr. William Pettie rates it, to from 28 to 30 years' purchase. The whole landed rental of England and Wales, and the Low-lands of Scotland, was stated by this writer at about 9 millions; and if he had included the High-lands of Scotland, it is reasonable to suppose that he would not have made the whole rental of the island more than 95 millions. G. King and Dr. Davenant, in the reign of queen Anne, stated the rental of England and Wales at 14,000,000l.; about 25 years ago, it was generally reckoned at 25,000,000l.; but at present it considerably exceeds that sum. The cultivated land appears, from the statement of Mr. Middleton, in his "View of the Agriculture of the County of Middlesex," to be 59,027,500 acres, and the commons and waste-lands to be 7,889,000 acres: and, therefore, the total of acres in England and Wales amounts to 66,916,500 acres. If, therefore, we consider the commons and waste lands as equal in annual value to only one million of cultivated acres, the whole may be taken at 10 millions: and taking the average rent, which, at 15s. per acre, appears to be a moderate computation, at a tenth let, the amount may come to 27,000,000l. and the value at 28 years' purchase to 75,000,000l. The number of cultivated acres in Scotland is upwards of 12 millions, and of uncultivated acres upwards of 14 millions, which, being of little use, may be wholly excludéd; and the cultivated part, being rated at an average of 10s. per acre, yields the sum of 6,000,000l.  

Vol. V.
per annum: and the total rental of Great Britain will be 33,000,000l., and the value of the land, at 30 years' purchase, be 900,000,000l. Other writers have endeavoured to prove, (see Bache's "Observations on the Produce of the Income Tax," that in the whole extent of England and Wales there are no more than 38,500,000 acres of land; and that Scotland, with its adjacent islands, contains about 21 millions of acres. It is not so easy to ascertain the value of the houses as it is to determine the value of the land; but the following statement of their rent, founded on the numbers returned as chargeable and excused to the window duties, in England and Wales, in 1781, will not be thought too high:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The total rent, at 20 years' purchase, makes 148,720,536l. and including Scotland at less than a sixth of England and Wales, the whole will amount to 170,000,000l.

In order to form an idea of the value of cattle and farming stock, on the land, we may consider the black cattle and calves, sheep and lambs, swine, pigs, and poultry, annually consumed in London as worth 6,000,000l., which cannot be more than a seventh of the whole consumption, amounting therefore in value to 42,000,000l; but the whole number of cattle existing must be more than double the quantity brought to market; so that, including horses, affies, cows kept for milk, and oxen employed in agriculture, the whole value of the cattle cannot be less than 90,000,000l.

Taking the annual consumption of grain of all sorts at 14,000,000 quarters, which is probably below the truth, it may be presumed, that in general there is at least three or four months' supply on hand, which, at only 35s. per quarter, will amount to at least 6,125,000l. The value of hay and straw, and all kinds of fodder, and of all implements of husbandry, cannot be less than five or six millions, and with the former sum will make about 12,000,000l. The total value of cattle and farming stock is therefore 102,000,000l.; and if it is to be estimated as equal in value to only three times the yearly rent, it will amount to nearly this sum.

The value of the shipping belonging to Great Britain may be more accurately ascertained: for it appears that, in 1794, the tonnage of the vessels in the merchants' service was 1,589,162 tons; but taking it at 1,500,000l., at 8l. per ton, it makes 12,000,000l. and this is without doubt below the real value. In the year ending the 5th of January, 1824, the number of British ships entered inward was 11,396; their tonnage 1,614,355; and the number of foreign ships 4,252, and their tonnage 638,034; the number of British ships cleared outwards, was 3,662, and their tonnage 574,542; and the number of foreign ships 3,662, and their tonnage 574,542. The shipping of the navy may perhaps be estimated at 4,000,000l. making, with the former sum, 16,000,000l., to which some addition should be made for the value of the small craft employed on our rivers and canals.

The quantity of money in the country has, at different times, been a subject of dispute, and has never been determined with precision. However, by the re-coining in 1773, 1774, and 1776, it was found, that the value of the light gold delivered into the bank amounted to 15,503,593l.; and it was generally admitted that somewhat more than two millions of heavy guineas remained out in circulation, which, with the silver and copper coin, made the whole, at that time, about 20 millions, at which sum Mr. Chalmers estimated it in the year 1786. Mr. Grellet estimates it at about 25 millions.

Of the value of the merchandize and manufactures usually in the hands of the merchants, wholesale dealers, shop-keepers, and manufacturers, it is very difficult to form a satisfactory idea. The total amount of the exports in 1797 was 28,017,000l. and of imports 21,013,000l., according to the custom-house accounts; but these accounts being considerably below the true value, if we take the whole as rated only 60 per cent. under the value in 1800, the annual amount of foreign trade, estimated for that period, will be 79,888,000l. to which some addition should be made for smuggled goods. Mr. Pitt, in 1770, computed the imports at 25,000,000l. and the exports at more than 33,000,000l.; and in Feb. 1801, the foreign exports at 17,000,000l. and the domestic at 20,000,000l., amounting to a total of 37,000,000l. The official value of all imports, on an average of six years, ending the 5th of January, 1804, was 29,400,045l.; and the official value of British manufactures exported, on the same average to the same time, was 25,834,340l.; and real value 40,960,870l.; and the official value of foreign merchandise exported, on the same average, to the same time, was 15,233,500l.; and the real value 9,323,575l. It was the opinion of a numerous meeting of merchants in March, 1797, that there is always, at the least, two months' supply of export and import merchandise in the custody of the merchants and traders, which, according to the above total of 79,888,000l. will amount to 13,314,660l., to which some addition should be made for property in the hands of foreign merchants. But the value of goods in the hands of manufacturers and retail traders far exceeds this sum. The official value of British manufactures exported in 1798 was 19,771,510l.; but this being at least 71 per cent. below the real value, we may take the actual value, on an average of two years, at 31,356,793l., which, it is presumed, cannot be more than a third of the whole produce of our manufactures; and accordingly, this will amount to 94,079,379l. If we deduct 5,000,000l. for that small part which is supposed to be in the hands of the merchants, the remainder will be 89,079,379l. and of this it is probable that there is much more than three months' supply in the hands of the manufacturers and retail traders, which, estimated in this proportion, amounts to 22,267,594l.

As to the value of that part of the property of individuals which consists in household furniture, wearing apparel, provisions, fuel, carriages, &c. &c. we can recur only to conjecture; but it may be thought not to be over-rated at three times the yearly rent of the houses which contain it, or 26,026,000l. in the whole of Great Britain.

The following summmary will exhibit the results of the above estimates:

<table>

</table>
From the above statement it appears that, since the year 1664, there has been an average gain of upwards of four millions per annum, of which a very considerable part has been derived, directly or indirectly, from foreign commerce. The great increase of the annual income affords a further proof that there must have been such an accumulating surplus. Sir W. Petty (Pol. Arith. p. 123.) supposed the income derived from land to be 8,000,000l. the profits of personal efates 8,000,000l. and the profits of all kinds of labour 26,000,000l., making together 44,000,000l. Mr. G. King estimated the whole income at 43,500,000l. Dr. Davenant, in 1701, states the income derived from land at 10,000,000l. the profits of trade at 6,000,000l. and those of sciences, arts, labour, industry, manufactures, retailing foreign goods, and buying and selling home commodities, at 33,000,000l. making in the whole 49,000,000l. These accounts are exclusive of Scotland; but after making a sufficient addition for this country, it will appear that there has been a considerable increase of the general income. Sir John Sinclair, in his "Hints addressed to the Public," in 1789, observed, that the income of the country arising from lands, commerce, and manufactures, was commonly calculated at 100,000,000l. which he inclined to think a low valuation; and, without doubt, the profit derived from late years from each of these sources has considerably increased. It is not easy to form a very precise estimate of the national income; but the following statement is presumed to be not very inaccurate:

Total: **£129,570,000**

If the total expenditure be estimated at 125,860,000l., which has been deduced from a minute, and, perhaps, as accurate a statement of particulars as the subject, admitting of various conjectures and presumptions, allows, the difference between this expenditure and the general income shews the annual gain of the country, or the sum applicable to the extension of commerce, the reservation of a greater quantity of foreign articles, the increase of shipping and buildings, agricultural or mechanical improvements, or other augmentations of the general flock.

On introducing the income-tax, Mr. Pitt, chancellor of the exchequer, gave the following estimate of the annual income of Great Britain:

<table>
<thead>

</tbody>
</table>

Total: **£102,000,000**

As one of the principal sources of the wealth of Great Britain consists in its manufactures, it may not be improper to give a brief statement of them; referring more copious detail for other articles in this dictionary, under which they will separately occur. The woollen manufacture deserves to be first mentioned, because it is the most ancient, and, in a variety of respects, the most important staple of the country. In an examination of the principal woollen manufactories by a committee of the house of commons not long ago, the quantity of wool grown in this country was estimated at 600,000 packs of 240lbs. each, which, valued at 11s. per pack, amount to 6,600,000l.: and though the increase of value of manufactured wool is various, and depends on its quality, yet it was estimated, that the total value of the wool manufacture in this country amounts to 19,800,000l. But the calculation supposes, that the number of sheep, in 1791, was 28,800,000, which exceeded the truth at that time, and much more since that period; and it was formed upon an unusually high price of wool. But the estimate will be much less objectionable, if it be formed on 500,000 packs at 10l. 10s. per pack, and thus the value of the wool will be 5,525,000l., and its manufactured value will be 15,500,000l. The average value of woollen goods exported for 1797, 1798, and 1799, is 6,104,211l. which, as the cullom-house values of goods exported are much below their real value, requires an addition of about 25 per cent. and thus it becomes 7,630,263l. The value of goods retained for home consumption will be nearly equal to that of such as are exported; and, therefore, the whole value of the manufacture appears to be about 15,260,000l. and may be taken, at a medium, between this sum and the former, at 15,500,000l. Deducting 10 per cent. on the cost of the goods, for the profits of the manufacturer, with interest of his capital, there will remain 14,090,901l. for the cost of materials and wages of labour; and as the value of the wool is about 5,250,000l.; the amount of workmanship, or the wages of all the persons employed in this manufacture, is 8,454,545l.; and the whole number of persons employed, averaging their wages at 8s. each per week, does not exceed 425,043.

The value of the leather manufacture may be estimated at 10,500,000l., from which deducting 954,545l. for the profits of the capital, and 3,500,000l. for the cost of the raw materials, the final gain appears to be 5,045,455l. The value of the linen manufacture is estimated at 10,000,000l., which, after deducting 954,545l. for the profits of the capital, and 3,500,000l. for the cost of the raw materials, the final gain appears to be 5,545,455l.
With respect to the first it is said, the total produce of pig-iron in Britain does not at present exceed 100,000 tons; and reckoning on an average, that 33 cwt. of crude iron produces one ton of bars, and that the manufacture of malleable iron amounts to 35,000 tons per annum, this branch will require 57,000 tons of crude iron; and the value in bars at 20l. a ton is 700,000l.; the remaining 42,500 tons, cast into cannon, cylinders, machinery, &c. at 14l. a ton, is worth 591,500l. The supply of foreign bar-iron is chiefly obtained from Russia and Sweden; and the quantity imported, on an average of 12 years, has been 44,135 tons, worth, at 22l. per ton, 970,000l., which, together with the former sums, amounts to 2,620,470l. Some years ago, the value of the iron manufacture was estimated at 8,700,000l.; but if this sum should appear too high, we may include tin and lead, and the value of the whole will probably amount to 10,000,000l., and the number of persons employed to 200,000.

The copper and brass manufactures are now established in this country. Till about the years 1720 or 1730, most of the copper and brass utensils used for culinary and other purposes in this country were imported from Hamburg and Holland, being procured from the manufactories of Germany; and even to late as the years 1745 and 1759, copper tea-kettles, saucepans, and pots of all sizes, were imported in large quantities. But the perfervishing industry, capitals, and enterprising spirit of our miners and manufacturers, these imports have become totally unnecessary; so that the articles are now all made here, and far better than any other country can produce. The discovery of new copper-mines in Derbyshire and Wales, about the year 1773, contributed to the extension of the manufacture in this country; and it appears to be still increasing, notwithstanding the late great advance in the price of copper. The value of wrought copper and brass, exported during the year 1799, was 1,222,185l.; and there is reason to believe, that the whole value of these manufactures at present is at least 3,500,000l., and the number of persons employed 60,000.

The steel, plating, and hard-ware manufactures, including the toy-trade, have been of late much extended, and may probably amount in value to 4,000,000l., and the persons employed to at least 70,000.

It is acknowledged, that many of these estimates must be essentially defective, from the want of public documents respecting many important branches of trade. However, they serve to shew, in a general view, the relative extent of our principal manufactures, as in the following summary:

<table>

£63,650,000 1,583,500

To the above enumerated manufactures of greater importance, we might have added those of hats, horns, fraw, &c. which taken together are of very considerable amount, and employ a great number of hands. There are also some, which, though not generally included among the manufactures,
The commerce of Great Britain extends through the eastern and western hemispheres of the globe, by means of the capital and credit of the country, the skill and industry of its artizans and manufacturers, the number of its ships and the character of its seamen, and the enterprising spirit as well as established reputation of its merchants. The number of registered vessels belonging to the British dominions, and employed in trade in 1802, was 20,676, their tonnage 2,128,055; and the number of seamen navigating the same, 154,530. In 1803, the number of vessels was 21,445; their tonnage 2,238,249; and the number of men 155,445; being an increase of 879 ships, of 110,194 tons, and of 915 men.

The following table will exhibit a complete view of British commerce solely from the port of London, for one year, ending Jan. 5, 1795, since which the commerce has increased.

RECAPITULATION.

The aggregate value of goods imported into London in one year - 29,706,476 17 4
British manufactures exported L. 11,396,539 13 8
Foreign merchandise, do. 14,208,925 14 6
Value of goods imported in upwards of 9000 coasting vessels, averaged at 5ool. each - 4,500,000 0 0
Value of goods exported coastwise, in about 7000 vessels, at 1000l. each - 7,000,000 0 0
Total amount of property shipped and unshipped in the river Thames, in the course of a year, estimated at 66,811,942 5 6
If we add to this climate, the accounts belonging to the other ports of Bristol, Liverpool, &c. the account must be enormous.

From the plains of North America are chiefly imported tobacco, rice, indigo, timber, hemp, flax, iron, pitch, tar, and lumber; from the West Indies, sugar, rum, cotton, coffee, ginger, pepper, guaiacum, farfapapilla, manchineal, muskogany, gums, &c.; from Africa, gold-dust, ivory, gums, &c.; from the East Indies and China, tea, rice, spices, drugs, colours, silk, cotton, saltpetre, shawls, and other products of the soil; from our remaining settlements in North America, furs, timber, pot-ash, iron; and from the various states of Europe, numerous articles of utility and of luxury. Pinkerton's Geog. vol. I. p. 100.

For other particulars relating to Great Britain, see Constitution, Debt, Fund, Parliament, Revenue, &c. See also England, Scotland, and Wales.

Britain, in History. It will be most fitting to the plan of this work, to divide the history of England into several branches, each of which may be consulted under the proper heads. These divisions will be,—the history of the island anterior to the Saxon invasion, which will be the subject of the present article;—the history of the Saxon or early from the invasion of the Saxon tribes to the period of the Norman conquest, which will be introduced under the word Saxons;—the history of England from the Norman conquest to the accession of James I., for which see the article England;—and the history from that period to the present times, which will be inferred under the same head. Scotland, Ireland, and Wales, will be separate subjects of history; and their transactions, so long as they continued independent nations, may be sought for under their respective names. So much as is necessary to be known of the history of the other British Isles, will be found under the articles of Heriades, Isle of Man, Orkneys, and Shetland. These different topics will comprise all that is material in the history of the British Isles.

It would give us very little trouble to flate the history of Britain anterior to the Saxon invasion, if we could adopt the account so popular among our ancestors, and give the fictions of Jeffry of Monmouth a place in our authentic annals. But Jeffry's history, though supported by the belief of most of the men of learning in the sixteenth century, by many in the seventeenth, and by some in the last, cannot for a moment be suffered to rank in our estimation as true history. We need not combat the tale by a profound disquisition: it has the merit of discrediting itself by its absurdities and improbabilities; and we might dismiss it into oblivion without another sentence, but that the public may be curious to know what sort of fiction it was, which was capable of interlacing our ancestors so much, and of seducing so many learned men to patronize and defend it.

After settling Ences in Italy, marrying him to Lavinia, and killing Taurans, in exact conformity to Virgil, Jeffry gives him one Sylvius for a grandson, whose friends, the magi of the day, oblige with a prophecy, that his name would be pronounced with a son, who would destroy both his father and mother, and after travelling over many countries in banishment, would at last arrive at the highest pitch of glory.

This unlucky lad was Brute, who killed his mother in his birth, and, at 15 years of age, completed the prediction by destroying his father. Being expelled Italy by his kinmen for the paricide, he went to Greece, and found the Trojans kept in slavery by one Pandraus, whom the author compliments with the title of king of the Grecians, but whom no Greek historian has ever acknowledged. Brute assembled the Trojans from all parts, and sent a letter to this Pandraus, affuring him that the Trojans would rather live after the manner of wild beasts on flesh and herbs with liberty, than enjoy the greatest luxury under his slavery.

Pandraus was forprized at this message; but he was ignorant that he had to do with a hero whom his historian had determined to make an infallible conqueror. It was, therefore, in vain he befieged a town called Spartanum, the situation of which only Jeffry knew, but with which he has forgotten to acquaint us; for though he outnumbered the Trojans so much that their brave commander dashed a pitched battle, yet Brute contrives a stratagem to enter their camp at night, deceive the watch, and kill them all in their sleep. He accomplishes all this as easily as he conceived it. Pandraus is taken prisoner; his army annihilated. A consultation is held to consider what is to be done with the captive; and it is a rule with Jeffry to detail the very words of every conversation, the speeches are again recited at full length; and Pandraus is liberated on condition of giving Brute his daughter Igogo for wife, with plenty of gold, silver, ships, corn, wine, and oil, and also permission to remove to some other country.

With his new wife and 324 ships, and after many fivens on the part of Igogo, and many knifes on the part of Brute, "which the grief of all the world grew weary of crying, and fell asleep," he fell fast, and two days afterwards came to an uninhabited island, in which was a convenient temple of Diana, and a statue of the goddes, that kindly gave answers to all who consulted her. In fix very pretty lines, which Milton thinks too good for the age of the translator, he affes her whither they were to go, though a reasonable man would have formed some notion of that before he had set out, and have trusted to the vague chance of a deserted island and a priestless oracle.

After repeating the words exactly nineteen times, and walking four times round the altar, and laying himself before it upon the skin of a white hart, he fell asleep. About the third hour of the night (for Jeffry is very particular in circumstance, though the incident is placed about 2000 years before him), about the third hour of the night, "the usual hour for deep sleep," apparitions, and visions, the goddes in person appeared to the Trojan, and in eight lines as harmonious as his own, informs him, that beyond Gaul there was an island in the west, formerly occupied by giants, but then deferted, where he should find another Troy, and a race of kings, by whom all the world should be subdued.

With this answer, but without being made much wiser by it, for Brute knew as much about Paradise as about Gaul, they put to sea again in a westward course, and in 30 days came to Africa, being ignorant as yet whither to steer. At last they reached the freights of Gibraltar, after great danger from pirates, where their ship had nearly been overturned by those sea-monsters called Syrens. However, they made a shift to escape, and contrary by advancing till to the west, for no retrograde course is mentioned, to get into the Tyrrenian sea, though, unfortunately for accurate geography, this sea, instead of being near Spain, or beyond it, is in the direct contrary course, because it washes the lower part of Italy. But be this as it may, here they pick up some Trojans, whose general was Corineus. This was a very model man, but withal so courageous, "that if he encountered with any giant, he would immediately overthrow him, as if he had been a child."

From this Tyrrhenian sea they reached the Lober, as suddenly as if Jeffry had fapposed they were close together. In vain all the kings and princes of Gaul united against the invaders; for they, whom some pirates had greatly endangered, and some Syrens had nearly drowned, now defeat all the confederated Gauls, burn their cities, lay waste their fields, and make "dijmal slaughter among the people, being unwilling
unwilling to leave so much as one alive of all that wretched nation.” After these humane exertions, “they build towns, as Homer tells us,” in some work to Homer and to us equally unknown; and then doubting if it were prudent to fight there any more, they fall to Britain, the promised land, and arrive at Totnes.

A new train of miracles begins; and, indeed, a little impertinence exhibited by Jeffrey, for the gods told Brute, that this island had formerly been inhabited by giants, but was now deserted; yet, in contradiction to the divine assertion, the daring monks, in the sixteenth chapter, peoples it, though thinly, with giants still.

However, at their coming, away fly the giants to their caves, to the great detriment of Corineus, “to whom it was the greatest possible diversion to encounter them.” To indulge his favourite inclination, he begins “the story of Cornwall for his sake, because the giants were in greater number there, than in all the other provinces.” Brutus obliges him: and an opportunity soon arrives to make Corineus very happy.

“Among the rest there was one detestable monster, named Goemagot, in stature 12 cubits (or about 18 feet high), and of such prodigious strength, that at one shock he would pull up an oak, as if it had been an apple-wood. One day, when Brute was at Totnes, this fellow, and 20 more of his companions, fell upon the new-comers, among whom they made a dreadful slaughter.” This was precisely what Corineus wanted; and as for the other twenty were soon dispatched, Brutus ordered “Goemagot to be preserved alive, out of a desire to see a combat between him and Corineus, who took vast pleasure in such encounters.”

“Overjoyed at this, Corineus threw aside his arms, and challenged the giant to a wrestling match;” but a Cornish hug from the Gobha of Cornwall soon broke three of Corineus’s ribs, which, we are very circumstantially told, were two on his right side, and one upon his left. But this accident, instead of disabling, “enraged Corineus to such a degree,” that though once mentioned but as a mortal man, and of mortal size, he seized hold of this tremendous giant, “threw him over his shoulders as if he had been an hare, ran with him as fast as he was able for the weight to the next shore, nay, got even up to the top of a very high rock, and there hurled down the savage monster into the sea.” “The place where he fell,” adds Jeffrey, “is called Goemagot’s leap to this day.”

The above circumstances present a faithful abridgment of the first sixteen chapters of this ancient history. The first patrons of “The British History” defended all its airy. The later advocates allow it to contain a few hyperbolies, but warmly maintain that it ought not to be wholly rejected on this account. But, unfortunately, the whole history is in this strain; of this only a few more brief specimens need be given.

Brennus, who besieged Rome at the head of the Gauls, when Camillus and the greece faved the capital, was, according to this history, a Briton; and his brother Belinus, then king of Britain, was with him. Conan, king of America, wanting wives for his soldiers, asks the king of Cornwall for some, who lends him 11,000 daughters of his nobility, and 69,000 of a meaner sort. The greater part of these are drowned; the rest are murdered. The magi commanded Vortigern to find a youth who had never had a father, and Merlin is accordingly brought, whose mother had a miraculous conception from a demon. The king cannot build a tower, because it is swallowed up as fast as it is raised. Merlin foretells, that there is a pond deep under the ground, which occasions it, and that at the bottom of it are two hollow stones, in which two dragons are asleep. Utter Pen-
dragon, to gratify his passion for Igera, is transformed by Merlin into the figure of her husband. To crown the whole, Cadwalllo being told on a certain island, and longing for venison, his servant Brian goes in search of same, but finding none, he cuts out a piece of his own thigh, which he roasts upon a spit, and carries to his master as venison!!! Whatever may have been the prejudices of former times in favour of the book, every reader will now treat it with derision, though he may not chuse to adapt the quaint paraphrase of the Dutchman, who called it a “groote, grove, lange, dicke, raflclieke, ende unbehafjme logen,” which in plain English is, a great, heavy, long, thick, palatable, and shameless lie.

The account of Brutus and his Trojans having colonized Britain, was in excelsis before Jeffrey. It appears in Nennius, who lived about, or before, the ninth century: his preface is a triumph to the advocates of the Trojan, because it announces that he had taken his history not only from the Roman annals, the chronicles of the holy fathers, and the histories of the Scots and Saxons, but also from the traditions of his ancestors, and from the monuments of the ancient inhabitants of Britain. On inspecting his history, it is curious to remark to what sources he refers his several incidents. The tale of Brutus is from the annals of the Romans; and his genealogy up to Aeneas, thence to Noah, and thence to Adam, was furnished to the chonographer by the traditions and writings of those who first inhabited Britain. Unfortunately for the tale, no Roman annals that we know of have sanctioned the history of Brutus; and we may be allowed to deny that the Druids had any acquaintance with the Jewish scriptures.

Of other romances on this remote part of our history; the dishonest forgery of Annius of Viterbo, who made certain annals of Beroth and others, in which Samothes, the son of Japhet, is said to have led a Celtic colony into Britain; of Albion, a giant, who was sent after Samothes to give it a name; of the visits of Hercules and Ulysses; of Albina, the princes of Syria, and her thirty filters, committed to the mercy of the sea for murdering their husbands, who were thrown providentially on England; of Celto, the daughter of Britannus; of Britannus, the grand son of Nemeth, who brought a colony here out of Ireland, and of such like wild and absurd inventions, we need only say that they are fit to class with the history of Jeffrey, and may be permitted to repose in oblivion, as proper companions to his Brutus and Corineus. To the same grave may be consigned all those writers who have wasted their time in deriving the Britons from Japhet, from Gomer, from Javan, from Thiras, from Alkenaz, or from Sheem. Such derivations are as unreasonable as the speculation of the man who affirmed that the earth was divided between the three sons of one father, as a typical representative of the divine Trinity.

The only account that can be fully relied on for the early history of the European nations, are those which the Roman and Grecian writers have transmitted to us. Even their statements frequently demand our criticism, but we must dig for truth in their mines.

From the extent of geographical knowledge which Homer displays, we might not unreasonably expect to find some allusion to the British isles in his works; but although he mentions with familiarity Italy, Sicily, Greece, Thessaly, Epirus, with some adjacent countries, and by Strabo and later authors, has been thought to allude to Spain, no other part of Europe is explicitly commenorated in his Epopees.

One of the oldest Greek books which contains any allusion to the British isles, is the Argonautica ascribed to Orpheus. The celebrated person of this name lived ante-
rior to Homer; but the poems that pafs under his name, are by Sinidas and Stobaeus attributed to a man whom they call Orpheus the younger, and whom others name Onomacritus. He has been referred to the times of Pusiratus, or about 360 years before Christ.

This poem is curious as a specimen of the geographical opinions which the author and his contemporaries entertained of the western part of Europe. It was a voyage from Thelifa to Colchis on the eastern part of the Euxine. But the part most interesting to us, is the manner in which these adventures are related to have returned home; for, instead of tracing back their course to Colchis, the difference of which was comparatively small, they fail to the Pals Mootis, or Sea of Aephus, thence up the lands to the northern ocean, and, after circumnavigating Europe, arrived at last at their destined port. So little was Europe known at this early period, that it was fancied to have been possible to have failed from the Euxine sea into the Hyperborean ocean.

Whoever reads this composition, from verse 1573 to 1597, though he may be entertained with the romantic fable of the Macedonians, who are seated in the icy ocean, and who, after living 1000 years in the most active exertions of wisdom and justice, void of labor and law, sink from uninterrupted felicity, into a gentle, but perpetual sleep; yet he will need no further evidence to convince him, that the author was wholly ignorant of the continent of Europe. It is indeed singular, that he mentions the island Lernida, which is presumed to be Ireland, and which the Argonauts pass with apprehension in their voyage from the North sea. But this is not mentioned with the accuracy of a man who knew what he was writing about, or else Britain, and not Ireland, would have been commemorated; for though Camden thinks that the island next mentioned under the name of HXARMZQ, or Piccis Obitan, was Britain, this cannot be the fault, because, after they had left Lernida, they were tossed by a furious tempest for twelve days before Lynceus discerned the island HXARMZQ. It is remarkable, that in opposition to all the mythologists, the author makes this island in the Atlantic to have been the residence of Ceres, and the place from which Proserpine was carried off by Pluto. With equal peculiarity he makes another island in the same sea, which he calls AXXAROC YSYPN; and which Camden, by a strange error, thought to be the same as the former, though three days fail from the habitation of Circe. The geographical mistakes of this author are worthy of notice, because the man who aspired to write in the celebrated name of Orpheus, is not likely to have been the most ignorant of his contemporaries.

About 450 years before Christ, Herodotus, the father of history, flourished. Greece was then so delitute of knowledge, that, like many of his countrymen who possessed activity and energy of intellect, he travelled to Tyre, Egypt, and Affria, in search of the information which these countries in his days almost exclusively possessed. His composition seems to indicate that he made geographical subjects a principal object of inquiry; and he sought for it at those places where it was most likely to be obtained. The situation of Greece, which on its eastern side lies parallel with Asia Minor, and had frequent intercourse with Egypt, Phocia, Sicily, and that part of the Italian peninsula which now composes the kingdom of Naples, introduced him to an acquaintance with the three continents. It is therefore, if anywhere, in his works, that we may reasonably expect to find the most accurate collection of the facts which were then known concerning the population of Europe, and of the British isles.

But when we take up the history of Herodotus, which gained the Olympic laurel, we perceive that no regions were at that time known, (with only one exception, which we shall hereafter notice,) except those which military horrors had explored. He is accurate about the tribes or nations that swarmed round the western shores of the Euxine from the modern Constaninople to the sea of Aephus; because Darius had professed a wild expedition against the Seythians who dwelt there. But the historian fails where the Persian depot was checked; and, if he indulges some hasty excursions beyond, it is only to repeat tales to abound, that the credit of his whole history has been impeached from his Seythic reveries. In other parts of the world, wherever the nations warred whose traditions he records, he seems anxious to be minute and faithful; but every other country which the glister of arms had not revealed, he did not consider, because he was unable to describe.

It is, perhaps, from this circumstance, that when we turn from Greece, and the adjacent kingdoms, and extend with national partiality our view westward over the regions, now divided into Spain, France, Germany, the Northern empire, and the British isles, we find the historian lamenting, but ingenuously confessing, the puerility of his information.

"I have nothing certain to relate concerning the western boundaries of Europe. I know as little of the islands called Calisctrides, from the tin which is thence imported among us; and though I have diligently inquired, yet have I never seen any man who by his own experience could inform me of the nature of that sea which bounds the extremities of Europe; however, it is certain that amber and tin come from its remotest parts." The ignorance of Herodotus must have been the ignorance of his age; for it seems to have by no means proceeded from his neglect of inquiry. "Europe has not been fully discovered by any man; and we have no account whether it be bounded on the north and east side by the sea." About 120 years after Herodotus, the preceptor of Alexander flourished, who reigned for so many ages in Europe the monarch of metaphysics. A treatise has been preferred to us, which is usually attributed to him; but to which his right has been disputed by men whose erudition is formidable enough to leave the question undecided, even by those whom their arguments may not convince. If the circumstance that affords the claim of Arifiotle appeared unsatisfactory to the two Scaligers, to Cafabon, Salinasius, Menage, Volfius, and others, we cannot but be, at least, doubtful on the subject. By these gentlemen it has been given to Theophratus, or to Anaximenes of Lampfchus, or to the roie Pofidonius. But whether the book "De Mundo" be the composition of Arifiotle, or of some of his contemporaries, or of his immediate succeffors, or even of later writers, it is, under every opinion, a proper subject for our present consideration. It seems to be a physiologish account of the universe; but it also contains a very rapid and concise survey of the geography of the world. If it was written in the age of Arifiotle, it will shew how little the geographers of those times knew. If it be of later date, it will prove that lapse of time gave no increase of knowledge.

After a singular conjecture, which Columbus has since happily demonstrated to be jurt, that beyond the Atlantic there were other continents, some larger, some smaller than our own, he describes the coasts which the ocean, as he thought, walked; and after conducing the sea from the westward through the straits of Gibraltar to the Propontis, he states its progress from the eastern regions. He tells us, that it comes towards the Gallic gulf, and thence to the columns of Hercules.

"In this sea are two islands, called P. PHXARAZ, AX[O]X [O]X [O]." They are directly above the Celts."

These
These curious passages deserve a moment's consideration. Of Europe this geographer knew that the northern parts were inhabited by the Scythians, and the western by the Celts; and that beyond the Celts were two islands called Bretanikai, whose names were Albion and Henra. This is the earliest author in which the British islands are explicitly named.

That the British islands were known to the ancient world long before the time of Caesar, may be inferred from the passage in Polybius, which mentions them. This author lived about 205 years before the Christian era. He enjoyed the confidence of Scipio and Lelius; and when he determined to write history, he made many journeys to the parts which he intended to describe.

In the latter part of his third book, he promised to write concerning the British races, the British islands, and the making of tin. Unfortunately for our curiosity, this treatise has not reached us. It is certain that he composed it, because Strabo mentions his discussions concerning Britain. Three other Greeks also wrote concerning Britain. These were Pytheas, Diacerehus, and the celebrated Eratosthenes, who all lived anterior to Polybius, and whose opinions about our island Polybius compared and disputed.

Thus we find that Britain was an island which had obtained much notice among the Greeks. We may also perceive, from some intimations of the classical writers, that the British islands had been discovered and visited by the Phenicians and Carthaginians.

There seems to be no reason to doubt that the Caffiterides were another name for the British islands. Pliny says, that Midaerus first brought tin from these islands; and Strabo acquaints us, that the Phenicians had been long accustomed to visit the Caffiterides from Spain for the sake of that metal; but concealing their course from others. He gives a striking instance of their effort to conceal the navigation to our islands. When the Romans followed a Phenician ship bound thither, the express purpose of discovering the market, the master ran his ship ashore, and destroyed it, rather than let them trace his course; and he was indemnified by his countrymen for the loss out of the public treasury. But the Romans, by frequent attempts, at last obtained the knowledge which they sought.

Bochart derives Bretanikai, the Greek name for Britain, from the Phenician or Hebrew words בִּיטְנַן, Baránnai, the land of tin. Caffiterides, the Greek for tin, from which the islands were called Caffiterides, he also compares, with much ingenuity, with the Chaldee Kifiria and Kifîra, by which the Targums of Jonathan and Jerusalem render the Greek word γασπρονος.

It was the invasion of Cæsar, about 54 years before Christ, which brought the Romans first acquainted with the natives of Britain. Cæsar, ambitious of attaining the highest distinction in the Roman state, applied himself to warfare, as the surest means of raising an exalted reputation, and of creating a solid power. With this view, he attacked and conquered the Gauls; and in prosecution of the same purpose he invaded Britain.

Not being well acquainted with the harbours of the island, he sent C. Voluminus in a vessel to explore them. The natives, at first alarmed at his preparations and threats, sent overtures of peace. Cæsar received them civilly, but perfused in his invasion. After five days absence, Voluminus arrived at Cæsar's flotilla, and reported his observations.

Cæsar embarked two legions of foot in about eighty transports; and with these, and eighteen more for the relief of his army, he sailed towards Britain.

He arrived at a part inconvenient for landing from its mountainous aspect, and beheld the rocks covered with the armed inhabitants. He remained five hours at anchor, waiting for the arrival of his whole force; and when the wind and tide favored, he sailed out about eight miles farther to a plain and open shore.

The Britons sent their horse and chariots to oppose his landing, and all their forces followed. A severe contest ensued. The Roman vessels were too large for the shallow sea, and their soldiers were obliged to leap into the waves in unknown places, and with heavy armour, and to conflict with the active natives, who were well acquainted with the coast, and zealous in their opposition. At first the Roman galleys brought their engines to bear against the Britons. Their appearance and effect checked the brave savages, and the standard-bearer of the tenth legion, at that critical moment, rushing with his eagle towards the enemy, the Romans followed with new courage, and, after a desperate struggle, compelled the Britons to retire.

This defeat occasioned new proposals of pacification, which were broken, and the struggle recommenced. The Britons were repulsed again, but Cæsar chose to abandon all further efforts to conquer the island, and returned to the continent.

In the following year he invaded the island again. The natives vigorously opposed him under the command of Cassivellaunus. They experienced defeats, but their resistance was too fierce for the Roman arms to support, and Cæsar again withdrew from the island, having shewn the island to the Romans (says Tacitus) but not having conquered it.

The Britons remained unmolested by any attacks from the Romans till the reign of Claudius, at which period, unfortunately for their independence, but perhaps happily for their civilization, they were invaded by Attales Pannias. Divided by civil feuds, and no longer opposing to the Romans that union of will and power by which they had baffled the genius of Cæsar, the separate exertions of their various tribes were generally disunited, and the struggle ended in the complete conquest of the island. The events of this conflict are chiefly recorded at great length by Tacitus, and are too familiarly known to us to be recited here.

In the third and fourth centuries Britain gave some disturbance to the Roman empire, by the turbulence of that part of the Roman army which was stationed within it. At various intervals they made some of their favourite officers emperors, who contended for the purple with the other competitors. In these centuries Britain was much disquieted by the inroads of the Frisii and Scots on the north and west, and by the Franks and Saxons from the sea. At last the barbarians pressed so vigorously on the Roman empire, that the Roman forces were compelled to abandon Britain in 409, and the island for a short time recovered its independence, to lose it again on the triumphal invasions of the Saxons. See Saxons.

Britain, New, in Geography, an appellation which has been appropriated, by some geographers, to the most northern regions towards Hudson's Bay, and the coast of Labrador; and comprehending the whole tract of country that lies north of Canada, commonly called the Esquimaux country, including Labrador, New North and South Wales; said to be 8,500 miles long and 7,500 broad. This is in general a mountainous, frozen, and barren country; abounding with lakes, rivers, and bays, that furnish plenty of fish. The fisheries and the fur-trade are the only products of this country that render it valuable. It is very thinly inhabited by people resembling the Laplanders, and the other nations in the north-western parts of Europe, from whence their ancestors probably migrated. But the name of New Britain is not admitted in French or English maps. See Hudson's Bay, and Labrador.

Britain, New, an island, or rather a group of islands, in the Pacific ocean, being a part of that extensive tract denominated...
BRITISH PLAGUE, in Medicine. See Sweating-Sickness.

BRITANNICA, in Botany. See Rumex Aquaticus, or Hydropsyphium.

BRITANNICO, John, in Biography, an eminent Italian scholar of the 15th century, was born in the Brevenien territory, of a family originally from Great Britain; and having studied at Padua about the year 1470, kept school at Brescia, and distinguished himself by several learned annotations on various classical authors, particularly Juvenal, Horace, Persius, and Statius in his Achilleide. He also wrote grammatical and other treatises, and an apology on Bartholomeo Catanien. He is supposed not to have long survived the year 1518, and did not live to publish his notes upon Pliny's Natural History.

BRITANICUS Codex Erofimi, in Biblical History, a MS. copy of the New Testament, which is one of the two MSS. (the Codex Ravinius being the other) that contain the disputed passage of the three that bear record in heaven, 1 John, v. 7. This MS. is probably the same with that called Montfortianus and Dublinensis, noted in the first part of Wetten's N. T. in the second 40, and in the third 34. It is of the 12mo size, contains the whole N. T., is written on a thick glazed paper, and not on vellum, in a modern hand, and is probably of the 16th century. Mill states, that it belonged originally to one Froi, a Franciscan friar, who possessed it either about or before the middle of the 16th century; a few years previous to which period, that is, between 1519 and 1522, it was known to Erasmus by the name of "Codex Britannicus." From Froi it came into the possession of Thomas Clement, probably a doctor of philosophy and medicine in England; from him it came into the hands of William Chare, a learned Greek scholar; after Chare, it was possessed by Dr. Thomas Montfort, and from him it took its name, because it belonged to him when it was collated for the London Polyglot; and since the time of Ulber, who had it after Montfort, it has been preferred in the library of Trinity-college in Dublin, where it is noted C. 97; and hence it is sometimes called Dublinensis. As Erasmus, in the two first editions of his Greek Testament, omitted: John, v. 7, but in the later editions inserted it, because he had found it, as he relates, in a Codex Britannicus, it has been concluded, with a very great degree of probability, that the Montfortianus is the same as the Britannicus of Erasmus; because, though every MS. in Great Britain has been carefully searched, this is the only one which contains the passage in question. In proof of this it is strongly urged, that the text of the third edition of Erasmus, in 1522, differs in this interpolated passage from all other editions, except those which were immediately copied from it, and at the same time agrees word for word with the Codex Montfortianus. Although no critic would describe a high antiquity to the Cod. Montf., we have no reason to suspect that it is a mere transcript from the Complutian Polyglot, which is said to be the only one with respect to the Codex Ravius. For the difference is strongly marked in numerous passages, and even the text in question, for which this MS. is famous, is not the same as in that Polyglot. Erasmus describes the Codex Britannicus as a Latinizing MS.; and Wetstein entertains the same opinion with regard to the Montfortianus, of which the passage in question, 1 John, v. 7, affords the strongest proof; for in the Cod. Montf. it not only differs from the usual text, but is written in such Greek as manifestly betrays a translation from the Latin. For the satisfaction of those who may not have access to other means of information, we shall give it below, with all the abbreviations, as it is given by Travis, in his letters to Gibbon, p. 152.

Here the article is omitted before the words expressive of Father, Son, and Holy Ghost, because there is no article in the Latin, and it occurred not to the translator, that the usual Greek was οὐκ ἐστιν ὑμῖν τῆς θεότητος. He has also in τοῦ θεοῦ, which is it seen Greek, for τοῦ ἁγίου, because he found in the Latin, in terra. He has likewise omitted καὶ ὁ θεός ὑμῶν, to ἔστι τῆς θεότητος, which is wanting in many Latin MSS. because the Latin council, held in 1215, had rejected it through political motives. The omission of this clause at the end of the 6th verse proves, not only that the writer of the Codex Montfortianus copied from the Vulgate, because no ancient Greek MS. omits the clause in that place, but that he copied even from modern transcripts of the Vulgate, because this final clause is found in all the MSS. of the Vulgate, written before the 15th century. It is therefore added, that ὁ θεός ὑμῶν, in the 6th verse, is altered to κυρίος, because chrissus is the reading of the Vulgate, though it is not found in any Greek MS. Besides, in this MS. the Latin arrangement is observed with regard to the division of the text into chapters, though at the same time the καθαρσία of Eusebius are noted. This Latin arrangement was introduced by Hugo de S. Caro, in the 12th century, and is that of our printed Bibles; but though observed in the modern MSS. of the Vulgate, it was in general not admitted into the Greek MSS. which adhered to the καθαρσία of Eusebius. Its admission, therefore, into the Codex Montf. not only shews what influence the Vulgate has had in this MS.; but proves, at the same time, independently of other arguments, that the Codex Montf. is very modern. For no Greek MS. is known, in which the text is divided into our present chapters, that was written before the 15th century; when the Greeks, who fled from their own country into the west of Europe, became transcribers for the members of the Latin church, and of course adopted the Latin divisions. Moreover, the dots over the 1 and 7, which have been urged in favour of the antiquity of this MS. on the authority of Montfaucon, who, in his
"Paleographia," had said that these dots were in use a thousand years ago, are likewise used in the most modern MSS. (see the same Paleographia, p. 324, 338.) and therefore, so far from being a proof of antiquity, they are used as an argument to prove, that the Cod. Montf. is very modern. No one MS. written in small letters, among the specimens produced by Montfacon, before the 12th century, has these dots. As these letters, a and e, are always dotted in the Cod. Montf., but not always in the MSS. of the 13th and 14th centuries, and still less often in those of the 15th century, we may infer that the Codex Montfortianus is at least as modern as the 15th century. Michelacci's Int. to the N. T. by Math, vol. ii.

BRITAIN, or BRETAGNIE, in Geography, was, before the revolution, a considerable province of France, with the title of a duchy, reunited to the crown by Francis I. in 1533. It derived its name from the Britons, by whom it was chiefly inhabited, when they were driven from their own country by the Saxons, and fought refuge in that part of Gaul called Armorica, which fec. This province forms a kind of peninsula, bounded on the north, west, and south by the sea, and on the east by Maine and Anjou. Its mean length is estimated at 57 leagues, and its breadth at about 53 leagues; its extent of coast was computed at about 150 leagues, containing a considerable number of bays and good ports. Its navigable rivers are the Loire and the Vilaine, united by the Durance, by means of a canal between Rennes and Dijon. The other rivers are the Ardre, the Ille, the Men, the Borneau, the Claye, and the Adon, which discharge themselves into the ocean. The climate is temperate; and the soil, which is generally gravel or gravelly sand, with low ridges of granite, is diversified with hills and plains; and extensive heaths, resembling Cornwall in its appearance, in some places covered with woods of oak, and in others well cultivated, and producing wheat, hemp, flax, &c. Numerous herds of cattle are bred and fattened in the pastures; game and fish are plentiful; cider is the ordinary drink of the inhabitants, and some parts produce wines and brandy. In some districts of this province there are mineral springs, and mines of iron, lead, and coal. The character of the Britons is rough and choleric; but they are brave, good soldiers, and excellent seamen. The commerce of this province is considerable, and consists of a variety of articles, recited under its principal towns. By the new arrangement, Bretagne forms the departments of the Ille and Vilaine, the North-coasts, Finistere, Morbihan, and Lower Loire.

BRITSE, in Agriculture, a term applied to slips, when they are over-ripe or shatter; in which case they are said to be bris.

BRITISH, in Geography, a term applied to slips, when they are over-ripe or shatter; in which case they are said to be bris.

BRITISH AMERICA, in Geography. See America.

BRITISH Coin. See Coin.

BRITISH Constitution. See Constitution.

BRITISH ISLANDS, in Geography, are those which are adjacent to the British coasts, and subject to the crown of Great Britain. Of these a geographical description, and other particulars relating to them, will be found under their respective names. We shall here only observe, that some of them, as the Isle of Wight, of Portland, of Thanet, &c. are comprised in some adjoining country, and are therefore to be looked upon, in a legal point of view, as annexed to the mother island, and part of the kingdom of England. As to others that require more particular consideration, see Isle of Man, Alderney, &c.

BRITISH Language. The language of the ancient Britons, when they were first invaded by the Romans, was a dialect of the Celtic; which had been the language of all the nations of Europe defended from Gomer, and still continued to be spoken by the people of Gaul, and several other countries. This is undoubtedly evident (says Dr. Henley,Hist. vol. ii. p. 336,) from the nature and reason of things; from the testimony of ancient authors; from the names of rivers, lakes, mountains, &c. in Britain being significant and descriptive in the Celtic tongue; and from the remains of that most ancient and venerable language in some parts of Britain, as well as in some countries on the continent. See WALES.

BRITO, BERNARDE, in Biography, a Portuguese historian and elegant writer, was born at Almeida in 1569, and having entered into the order of Cistercians, was sent to pursue his studies in Italy. On his return he was appointed principal historiographer for Portugal, and was the first writer who undertook a general history of that country; of which, under the title of "Monarchia Lusitana," he published one volume in 1597, and a second in 1609. The work was continued by fathers Antony and Francis Brandano to seven volumes folio; the last of which was printed at Lisbon in 1612. Brito also wrote "Eulogies of the Kings of Portugal, with their Portraits," "Ancient Geography of Portugal," and "Chronicle of the Cistercian Order." He died in 1617. Nov. Diel. Brit.

BRITOLAGAE, in Ancient Geography, a people who, according to Ptolemy, inhabited Lower Maha, towards the mouth of the Danube.

BRITTON, in Geography, an island in the Frozen Ocean, near the south-west coast of Nova-Zembla. N. lat. 71° 30'. E. long. 55° 14'.

BRITTLENESS, in Natural Philosophy, that quality of bodies by which they are soon and easily broken by pressure or percussion. It is opposed to tenacity.

Brittle bodies are extremely hard; the least percussion effects a force on them equivalent to the greatest pressure, and may consequently easily break them. This effect is particularly remarkable in glass suddenly cooled, the brittleness of which is thereby much increased. Tin, though in itself tough, gives a brittleness to all the other metals, when mixed therewith. The brittleness of glass seems to arise from the heterogeneity of the parts whereof it is composed, salt and sand, which can never bind intimately together.

In timber, brittleness seems to be connected with durability; the more brittle any sort of wood is, the more liable it is found. Thus it is oak is of fo long duration, while beech and birch, as being tough, presently rot, and are of little service for building.

BRITTLENESS of the hoof, in horses. See HOOF.

BRITTON, THOMAS, in Biography, the musical small-coal man. This was an ingenious, inofficious, and humble man, of a profession which no longer subsists. Not only the use, but even the name of small-coal is hardly known at present. Dr. Johnson defines it: "Small-coal, little wood coals, used to light fires;" and illustrates the word from the Spectator, and Gay.

"A small-coal man, by waking one of these dilligent gentlemen, faved him from ten years imprisonment." Spectator.

"When small-coal murmurs in the hoarser throat, From smutty dangers guard thy threatened coat." Gay's Trium.

In our own memory, small-coal was daily cried about the streets, and of general use in the capital at least, in kindling fires.

Britton was a great favourite of Harenne, the antiquary, whom he much resembled in his fondness for old things, and who has given a long account of him in the appendix to "Homing! Chartularium Eccleie Wigorinii," and informs us, that Britton was born at or near Higham Fizzeys, in Northamptonshire, from which place he went to London, where he bound himself apprentice to a small-coal man. After he had served his full time of seven years, his master gave
give him a sum of money not to set up. Upon this, Tom
went into Northamptonshire again, and after he had spent
his money, he returned, and set up a small-coal trade,
though his matter was still living, taking a stall in Clerk-
swell, which he turned into a house. This seems the
only diabolical action with which Tom could ever be
charged.

Some time after he had been settled in business here, he
became acquainted with Dr. Garanciere, his neighbour, an
eminent chemist, who admitting him into his laboratory,
Tom, with the doctor's consent, and his own observation,
soon became a notable chemist, contrived, and built himself
a moving laboratory, in which, according to Hearne, "he
performed with little expense and trouble, such things as
had never been done before."

Besides his great skill in chemistry, he became a practical,
and, as was thought, a theoretical musician. Tradition
only informs us, that he was very fond of music, and
that he was able to perform on the viol da gamba at his
own concerts, which he at first established gratis in his mife-
rable house, which was an old mean building, the ground-
floor of which was a repository for his small-coal; over this
was his concert-room, long, low, and narrow, to which
there was no other access than by a pair of stairs on the
outside, so perpendicular and narrow, as scarcely to be
mounted without crawling.

Hearne allows him to have been a very diligent collector
of old books of all kinds, which, in his courses through the
town crying his small-coal, he had a good opportunity of
doing at stalls, where he used to stop and select for pur-
chase whatever was ancient, particularly on his two favourite
subjects of chemistry and music. On the former, it has
naturally been suggested, that he had picked up books on
Rosicrucian mysteries, and not impossible, but that he may
have walled some of his small-coals in the great secrets of
alchymy in the transmutation of metals.

With respect to music, he collected all the elementary
books in English that were then extant: such as Morley's
introduction, Simpkin's division violift, Playford, Butler,
Bath, and Mace; nine books of instruction for the fag-
modly, flute, and mock trumpet. But besides his vail
collection of printed music, the catalogue of which fills eight
pages in 4to. of sir J. Hawkins's hill of music, he seems to
have been such an indefatigable copyist, that he is said
to have transcribed with his own hand, very neatly and ac-
curately, a collection of music which stood after his decease
for near 100.

Mr. Walpole, in his anecdotes, says that "Woolaston the
painter, who was a good performer on the violin and flute,
was at the concert, held at the house of that ex-
traordinary person, Thomas Britton the small coal man,
whole picture he twice drew, one of which was purchased
by sir Hans Sloane, and is now in the British museum:
there is a mezzotinto from it. T. Britton, who made much
noise in his time, considering his low station and trade, was
a collector of all sorts of curiosities, particularly drawings,
prints, books, manuscripts on uncommon subjects, as mystic
divinity, the philosopher's stone, judicial alchymy, and mag-
ic; and musical instruments, both in and out of vogue.
Various were the opinions concerning him: some thought
his musical assembly only a cover for fraudulent meetings;
others, for magical purposes. He was taken for an archi-
d_, a presbyterian, a Jesuit. But Woolaston the painter,
and the son of a gentleman, who had likewise been a member
of that club, averred it as their opinions, that Britton was a
plain, simple, honest man, who only meant to amuse him-
self. The subscription was but ten shillings a year; Britton
found the instruments, and they had coffee at a penny a dish.
Sir Hans Sloane bought many of his books and MSS. now
in the museum, when they were sold by auction at Tom's
coffee-house near Ludgate."

We have in early life conversed with members of this
concert, who spoke of him in the same manner. So late as
the middle of the last century, mezzotinto prints of him were
in all the print shops, particularly an excellent one by
Smith, under which, and almost all the prints of Britton,
were the following verses by Hughes, who frequently per-
formed on the violin at the concerts of this ingenious small-
coal man.

"Though mean thy rank, yet in thy humble cell
Did gentle peace and arts, unpurchased, dwell;
Well pleased Apollo threaten'd his train,
And music warbled in her sweetest strain.
Cynethus so, as fables tell, and Jove,
Came willing guests to poor Philémon's grove.
Let ufeless pomp behold, and blush to find,
So low a fiation, fuch a liberal mind?"

In most of the prints, he was represented with his back of
small-coal on his shoulder, and his measure of retail in his
hand.

In the Guardian, No. 144, Steele speaking of the variety
of original and odd characters, which our free government
produces, says: "We have a small-coal man, who begin-
ning with two plain notes, which made up his daily cry, has
made himself master of the whole compass of the gammut,
and has frequent concerts of music at his own house, for the
entertainment of himself and friends."

But the affterton of sir John Hawkins, that Britton was
the first who had a meeting that corresponded with the idea
of a concert, is not correct: in the time of Charles I.
and during the usurpation, at Oxford, meetings for the per-
formance of fancies in fix and seven parts, which preceded
sonatas and concerts, were very common. And in Charles
the Second's time, Banister, father and son, had concerts,
first at taverns and public houses, and afterwards at York
buildings.

It is, perhaps, not a matter worthy of dispute; but we
imagine, that it would be difficult to prove that Handel
ever played at the small-coal man's concert. Handel was
proud, and never had much respect for English composers.
He had been careless and patronized by princes and nobles
fo long, that he would as soon have gone into a coal-pit
to play at a concert, as to the hovel of our vender of small-
coal.

About the commencement of the last century, a passion
prevailed among several persons of distinction, of collect-
ing old books and MSS.: and it was their Saturday's amuse-
ment during winter, to ramble through various quarters
of the town in pursuit of these treasures. The Earl of Ox-
ford, Pembroke, Sunderland, and Winchelsea, and the
duke of Devonshire, were of this party, and Mr. Bagford
and other collectors affixed them in their researches. Brit-
ton appears to have been employed by them; and as he was
a very modest, decent, and unpreening man, he was a
flarer in their conversation, when they met after their morn-
ings's walk, at a bookeller's shop in Ave-Maria lane. Brit-
ton used to pitch his coal sack on a bulk at the door, and,
dressed in his blue frock, to step in and spend an hour with
the company. But it was not only by a few literary lords
that his acquaintance was cultivated; his humble roof
was frequented by amateurs of the fair and the gay; and
his fondness for music caused him to be known by many dile-
untants and professors, who formed themselves into a club at
his house, where capital pieces were played by some of the
first professional artists, and other practicioners; and here
Dubourg, when a child, played, standing upon a joint-stool,
the first solo that he ever executed in public.

We cannot terminate this article better than from Dr.
Aikin's
Alkin's account of Britton. (Gen. Diag.) The circumstances of his death were as extraordinary as those of his life, if the story is to be credited. A ventriloquist was introduced into his company by an acquaintance who was fond of mischiefous jests. This man, in a voice, seemingly coming from a distance, announced to poor Britton his approaching end, and bid him prepare for it, by repeating the Lord's prayer on his knees. Britton, whose mythical and magical books had probably made him credulous, obeyed the injunction, went home, took to his bed, and actually died in a few days. This was in September 1714. He was buried with a very respectful attendance in Churchwell church-yard.

BRUVIN, in Geography, a cape on the west coast of Nova Zembla. N. lat. 74° 40'. E. long. 53° 14'.

BRIVA flizes, in Ancient Geography, a place of Gaul, on the Ilara or Ofie, a little north of its confluence with the Sequana or Seine.

BRIVAS, a place of Gaul, belonging to the Arverni, upon the Claver or Aliver, a little north of Condate: famous as the burial-place of St. Julian, near which, the emperor Avitus was interred in 456. See Brioude.

BRIVATESPORTUS, or GOSSEIVRES, le Croise, a place of Gaul, at the mouth of the Loire, near its union with the river Herus or Vistua, according to Ptolemy.

BRIVEGA, or BRICACA, in Geography, a small town in Spain, in Callisse, seated on the Taja, having a caftle. It trades in wool and fluffs. In 1710, general Stanhope, commander of the English forces, was obliged to surrender himself and his men prisoners of war at this place.

BRIVES, a town of France, and principal place of a district, in the department of Corrèze; 4 leagues S.W. of Tulle. The place contains 5763, and the canton 13,683 inhabitants: the territory comprehends 105,758,7 degrees, and 11 communes. This is a considerable place, lively, and very populous. The surrounding country produces wine, and nut oil, and abounds in wood. The town has some manufactures, and is adorned by many neat churches. N. lat. 45° 10'. E. long. 1° 40'.

BRIVESAC, a town of France, in the department of the Corrèze; 6 leagues E. of Brires.

BRIVIO, GIOVANNI, in Biography, an Italian singing-master and composer of Milan, where he opened a singing-school in 1732. The celebrated Salomoni, Appiani, and Mancini were his scholars; and was Giusप्पा Perfani, who had for a long time a favourite singer in England, and who, though only a second-rate performer at the Opera, was many years the best female singer at our concerts, and in Handel's Oratorios.

Brivio, as composer, had considerable merit, and furnished the lyric theatres of Italy with several successful operas.

Brivio, in Geography, a town of Italy, in the Milanese, on the road from Bergamo to Como.

BRIX, a town of France, in the department of the Channel; 5 miles W. of Vallogues.

BRIXA, L. See LEBRIX.

BRIXELLUM, in Ancient Geography, a town of Gallia Cipadana: now BERSELLO, which is.

BRIBEN, in Geography, a district of the Tyrol, in Germany, is situated among the Rhetian Alps, and is very fruitful, especially in vine. The prelate has a revenue of about 30,000 crowns per annum, and is a prince of the empire and flate of the circle of Austria: though in ecclesiastical matters, he is subject to the archbishop of Salzburg. He has a vote and a seat in the diet of the empire, and furnishes his contingent of taxes and imposts. The religion of the diocefe is Roman catholic; but among the peasants there are some Lutherans: the capital is Brixen.

BRIXEN, the capital of the preceding bishopric, seated on the river Eyfach, at some distance south of the Brenner mountains. It is surrounded with hills and vineyards, and is a well-built populous town; the houses being adorned with piazzas, and painted on the outside. It has many public buildings, exclusive of the cathedral, which is handsome, and several spacious squares: the mineral waters in its vicinity cause it to be much frequented. In 1706, a council was held here by the emperor Henry IV, which deposed Pope Gregory VII. This town was taken by the French in March, 1706. N. lat. 46° 35'. E. long. 11° 57'.

BRIXENTADT, a town of Germany, in the circle of Fraunconia, and principality of Anspach, affording an asylum for involuntary homicides; 16 miles E. N. E. of Wurzburg.

BRIXIA, in Ancient Geography, a town of Regno Transpadana, belonging to the Cenomani, seated on the Mela; now Brescia, which is.

Brixia, a river of Scouria, which discharges itself into the Perigetic, and which rendered the coasts dangerous, according to Pliny, by the quantity of mud deposited by it.

BRIXTON, in Geography, lies on the west side of the Isle of Wight, and is an open bay to the north-west from the tenth point of this island. The ground is rocky, and in swelling seas or winds inshore, it does not afford a defensible retreat nor a safe anchorage.

BRIZA, Quaking grass, in Botany, (87, 2a, to nod) Linn. 84. Reich. 69. Schreib. 115. Gerhi. 6. Tab. 1. Hift. 32. La March. Tab. 45. Smith Flor. Brit. 34. Clapham, triumfia digynia. Nat. Ord. Gramin. Gen. Char. Cal. glume many-flowered, two-valved, spreading, blant, collecting the flowers into a false corolla, twor-riieked. Cor. two-valved; the lower valve the five and figure of the calyx, the upper one very small, flat, roundish, enclosing the other. Not two-leaved; folioles linear, crinklate. Stem; filaments three, capillary, oblong. PIlfl. gern, roundish, spreading. Stigma, plumose. Peric. none; the corolla unchained contains the seed, and when ripe, opens and drops it. Seed, one, adhering to the corolla, compressed. Eff. Char. Cal. bifoliate, many-flowered; little spikes two-valved. Cor. two-valved, ventricose, with corollate obtuse valves; seed adhering to the corolla, deprefted.

La March observes that Briza is too nearly allied to Poa, to make a good distinct genus. He has, however, kept them separate: but judging that what has been called a multivalve calyx is Uziola, its principal difference from Briza, is nothing more than two or three abortive flores, he has abolished the genus, and defcribed its species under Briza. In agreement with the greater number of authors, we have thought it better to preserve the original distribution. Species 1. B. minor. Lin. (Eng. Bot. 1216) effera. Knap. (Gram. Brit. 61.) “Spikes triangular, feather-flowered; calyx longer than the flores, spidrl very long, lanceolate." Dr. Smith. Root fibrous, fmall, annual. Calum erect, about beam inches high, round, roughish, with minute spines pointing downwards, leafy, often branched at the base. Leaves spreading, erect, lanceolate, acute, flat, of a plain green, fringed, rough at their margin. Sheath fringed, smooth. Stipule lanceolate, very long, embracing the stem, deciduous, adhering to the leaf above, very tender. Panicle spreading widely; branches growing two together, branchlets dichotomous, divariate, capillary, rough, green. Spikelets pendulous, trembling, defoliate, smooth, beautifully variegated with white and green, with about seven flowers. Calyx-glands nearly equal, concave, very obtuse, fringed, membranaceous at the margin, longer than the flores. Flores alternate, gradually smaller; inner glumes very small, emarginate. Dr. Smith defcries the culm as smooth, but in specimens sent us from the west of England, it has a slight roughness, just fensitive to the touch, and visible with a strong magnifier. We have, therefore, followed Mr. Knap in this part of the description.
The greater length of the calyx is most observable when the
papula has just burst from its sheath. At a more advanced
period the limbus nearly disappears. It is a rare plant
in England, peculiar to the southern counties, and chiefly
found in Cornwall. 2. B. minuta, Linn common growing
roots, corms, tubers. 3. B. tenellus, Linn. "Spikes ovate,
seven-flowered, calyx shorter than the flowers, ripule very
short, obtuse." Dr. Smith. 3. B. tenellus, Linn. "Spikes
perennial, fibrous, elongated, leaves entire, round, leathery,
soft, smooth. Leaves acute, flat, slender, a little rough.
4. B. longifolium. Linn. "Spikes ovate, many-flowered,
smooth, ripule very short, obtuse." Leaves acute, flat,
slender, a little rough. Leaves, very long, fimbriated.
5. B. tenuis, Linn. "Fruits in nearly equal, concave, obtuse, scarcely
pointed, sessile, at the margin. Fruits as in the minus. Dr.
Smith. Common in the dry, stony meadows of Europe, and
other parts of Europe. It has no peculiar excellence, and has never
been cultivated separately. 5. B. verum, Linn. "Spikes ovate,
many-flowered; calyx equal to the flowers." Very like the
papula, but the leaves are twice as broad. Root annual.
Leaves acute, decurrent, adhering to the leaf above. Punica
glumigerum, Linn. "Spikes ovate, green, many-flowered;
branchlets much divided, occasioned by calyx knots depress
them at their base. Fruits have a smaller, readily falling
off when dried. Nature of the Levant, Spain, &c. Introduced into
ovate, calyx shorter than the flowers, calyx glandular." Thunb.
Cape of Good Hope. 5. B. egyp'tiaca. (Poq.
Brizzi, Linn. Sup.) "Spikes ovate, ten-flowered,
podium chiefs. Cape of Good Hope. 6. B. maxima, Linn.
"Spikes cordate; flowers seventeen." Root annual. Leave broad.
Culm about a foot and half high. Spikes very few, very
large, thick, fimbriated, variegated with green and white.
Podium simple. Italy, Portugal, Cape of Good Hope, India. 7. B. egyp'tiaca.
Linn. "Podium oblong; spikes late abundant, many-flowered."
La March. Root annual. Culm from five to seven
inches high, decumbent near the bottom. La March
observes, that it is nearly allied to Poq. egyp'tiaca, and
Wildenow doubts whether it be more than a variety of it;
but Villars ascertains that it may always be distinguished by
the outer valve of the corolla, which is concave, pellucid,
with a nerve running along the middle, and two along the edge.
South of Europe. 8. B. monspeliaca. Allion. "Spike
nodding, simple; spikeslets alternate, peduncled, subfoliatory,
flakes fimbriated." Martyn's Miller.

BRIZACCA, in Ancient Geography, a town of Aphi, in
Armenia Major. Polomy.

BRIZANA, a river of Aphi, in Persia Propria. Its mouth
was dangerous, according to Arrian, on account of the
floods and rocks with which it abounded. Polomy calls this
river Cusanana.

BIZE, in Agriculture, a word that signifies such lands
as have remained long without tillage.

BIZZ-vents, or BIZZ-vents, a kind of shelters used by
gardeners, who have not walls on the north-side, to keep the
cold winds from damaging their melon beds.

BIZZ-vents are inclosed S or E or W or S E, and an
inch thick, made of straw, supported by stakes fixed into
the ground, and props across both inside and outside, fastened
together with willow twigs, or iron-wire.

BRIZEMBOURG, in Geography, a town of France,
in the department of the Lower Charente, and district of
St. Jean d'Angely; 2 4 leagues S. of St. Jean d'Angely.

BRIZEN, a town of Germany, in the circle of Upper
Saxony, and Middle Mark of Brandenburg; 4 leagues N.
of Wittenberg.

BRIZZO, or BRICCI, FRANCESCO, in Biography,
a painter of architecture and landscape, was born at Bologna
in 1574, and educated first in the school of Pafferot, and
afterwards under Ludovico Caracci. Having applied with
great diligence to the study of the principles of perspective
and architecture, he acquired a style in his compositions
of such distinguished excellence, that his pictures were much
admired, not only for the truth of the perspective, and
the beauty of the colouring, but also for the grandeur of his
ideas, the majestic style of the architecture, the elegance of
the ornaments, and the noble table of landscape, which he
introduced to set off his buildings. He was also an engraver,
and is said to have allied Agostino Caracci, in the plates
which he engraved; to have also some specimens of this master.
Of his prints we may mention his " Habub Family," " from
Correggio; "St. Roch," from Parmigian, the " Flight
into Egypt," from Ludovico Caracci; and " Christ and
the Woman of Samaria," from Agostino Caracci. He died in

BROACH, BROCHA, in Middle Age Writers, denotes an
awl or bodkin. Among us broach is chiefly used for a steel
instrument serving to open holes in metals. It is sometimes
also applied to a stick on which thread or yarn is wound;
and, in the North, to a sort of wooden needles used in
knitting certain coarse things.

See an account of the broach used in weaving tapestry,
under TAPESTRY.

In some part of England, a spit is called a broach: and
hence also to broach a barrel, is to tap it. The ancient lords
received from their tenants a fee or tribute, called feryfogium,
for the liberty of broaching a cag of ale.

The term broach or breech, is also used in Scotland, to
denote a certain utensil used by the Highlanders for
fattening their veal, and resembling the "fibula" of the Romans.
This broach is commonly of silver, of a round figure,
and furnished with a tongue, crossing its diameter, and
leaving to fasten the folds of the garment: some have two tongues,
one on each side of a crescent bar in the middle. Ancient
broaches of elegant workmanship, and richly ornamented,
are preserved in several families; some of which are incribed
with names, to which particular virtues were ascribed,
and others furnished with receptacles for relics, supposed to
defend from harm: so that they seem to have been used not
only in dres, but for the purpose of amulets.

BROACH, in Geography. See BROACH.

Broach to, is when a ship falling large suddenly flies
up to the wind, in consequence of the difficulty of steering,
or of bad weather, &c. So that the sails are all taken aback.

BROAD-Arrow, in Heraldry, differs from the pheon by
having the inside of its bars plain.

BROAD Bank, in Geography, a bank on the coast of Fland-
er, the south end of which is about 4 or 5 leagues N. by
E. from Caunis cliff. On the west side between this and
Rattle-bank, is a channel of 18 or 19 fathoms.

BROAD Bay, a bay of America, in the district of Maine,
lying on the line of Lincoln and Hancock counties,
bounded by Pemaquid point on the west, and Pemaquid
point on the east.

BROAD Bay, on the coast of Wales. See St. Bride's Bay.

BROAD-eag Inland, in Agriculture, that sort of arable
cultivation in which the seed is put into the soil by the hand,
without the aid of machinery. In this way the seeds are
scattered over the surface of the ground, without being con
fined in regular rows, as is the case in the drill method, which
is mostly opposed to it. The putting of the seed into the
earth in this way seems better suited to the flory and more
fluffiness...
flatt kinds of land, than that by means of machines, as they must constantly be liable to be put out of order, and of course to deposit the feed in an irregular manner. See Husbandry.

Broad-cast Sowing, that mode of putting grain, turnips, pulse, clover, grasses, &c. into the earth, by throwing them over the surface by the hand. See Sowing.

Broad Fourteen, in Geography, the name of a fand which lies 5 or 6 leagues N. from the Texel, extending by a small tail N. from the Texel, and N. W. by N. from Flyer Vlialand island towards the south. Upon this sand are generally 14 fathoms of water, and between it and the land from 15 to 19, and more northerly 20 fathoms.

Broad Haven, a considerable harbour of the county of Mayo, Ireland, lying between Uriss and Binwy heads. It is very extensive, has good ground, and water of sufficient depth for any ship; but is so much exposed to northerly winds, that there is not room for more than two large ships in well sheltered anchorage. Small vessels, however, may go further up, and lie very safe on that sand, with three or four feet water under them at low water. The western shore of this bay is formed by the peninsula of the Mullet, sometimes erroneously represented as an island. There are at present only a few fishing villages on the coast of this harbour. About two miles N. by E. of Binwy head are three or four very remarkable rocks, called the Stags of Broadhaven.

Lon. between 5° 40', and 5° 45' W. Lat. 54° 19' N.

Broad piece, in Coinage, a denomination given to certain gold pieces broader than a guinea; particularly Caroluses and Jacobes.

Broad River, in Geography, an arm of the sea, extending along the west and north-west sides of Beaufort or Port Royal island, on the coast of South Carolina, and receives Coosa river from the north-west, which may be also called an arm of the sea. These two arms embrace all the islands between Coombahee river and Dawfufkee found, with which Broad river also communicates. Channels between Broad river and Coosa form the islands. The entrance through Broad river to Beaufort harbour, which is one of the best in the state, lies between Hilton's head and St. Phillips's point.

Broad River, or Cherokee-haw, a water of Savannah river, from the Georgia side, which empties into the Savannah at Charleston.

Broad River, in South Carolina, rises by three branches from the N. W. viz. the Enmoree, Tiger, and Packolee, which unite about 40 miles above the mouth of the Saluda river; and this, with Broad river, forms Congaree river. Broad river may be rendered navigable 30 miles in North Carolina.

Broad Sands, lies on the west side of the buoys of the channel in the Zuyder Sea, within the Texel.

Broad-side, in the Sea-Language, a discharge of all the guns on one side of a ship at the same time.

A broad-side is a kind of volley of cannon, and ought never to be given at a distance from the enemy above musket-shot at point-blank.

Broad Sound, in Geography, is the opening from the S. W. into the roads and harbours of the Scilly islands. In this sound there is good anchorage, when St. Mary's island on the E. S. E. and Samfon island to the W. N. W. and the S. point of Tresco island on the N. are nearly at the same distance of about a mile. — Also, a found in the N. W. point of France, called by the French "Paiffage de Liroife," lying between Point de Sant and the island of Ulflant, and extending to sea about 5 leagues from St. Matthew's point. — Also, a found on the coast of Norway, between which and the north part of Swalland are Flaxack islands. — Also, the found which is the entrance into Bollon harbour from the N. E. in a direct line for Nick's Mate island. — Also, a found in the South Pacific ocean, on the west coast of New Holland, within the bay of Inlets, being cape Palmerston for its N.W. entrance. It is separated from Thirly by an island lying in the direction of S. S. E. and S. called Long island, S. lat. 21° 30' to 21° 50'. E. long. 149° 20'.

Broads, in Building, a species of free-raise, thus denominated because it is raised broad and thin out of the quarters; or not exceeding two or three inches in thickness; chiefly used for paving.

Broads, or wheel-waggon. See Waggon.

Broads-worm, in Zoology, synonymous with lumbricus lutes of old writers. See Tenea, and Tape-worm.

Broadalbin, in Geography, a township of America, in Montgomery county, New York; containing, by the last census of 1796, 277 inhabitants, who are electors.

BROADLEY, a town of Poland, in the principality of Belfry; 45 miles E. of Belfry.

BROACH, a town of Germany, in the circle of the Lower Rhine, and electorate of Treves; 15 miles S.E. of Treves.

BROCADE, in Commerce, a sort of stuff, or cloth of gold, silver, or silk, raised and enriched with flowers, foliage, or other figures, according to the fancy of the manufacturer.

Formerly, the term was restrained to cloths woven either wholly of gold, both of woof and warp, or of silver, or of both together; but by degrees it came likewife to pass for such as had silk intermixed, to fill up and terminate the flowers of gold and silver. At present, any stuff of silk, satin, or even simple taffety, when wrought and enriched with the flowers, &c. obtains the denomination of brocade.

In the manufacture of brocades, the flattened gilt wire is spun in threads of yellow silk, approaching as nearly as possible to the colour of gold itself. The wire, winding off from a bobbin, twirls about the thread as it spins round, and by means of curious machinery, a number of threads are thus twisted at once by the turning of one wheel. The principal art consists in regulating the motion, that the several convolution of the flattened wire in each thread may just touch one another, and seem, as it were, one continued covering. At Milan, it is said, there is made a sort of flattened wire, gilt on one side, which is wound upon the thread, so that only the gilt side appears; the preparation of this wire is kept a secret, and has been attempted in other places with little success. There is also a gilt copper wire, made in the same manner as the gilt silver. Savary observes, that this kind of wire, called false gold, is prepared chiefly at Nuremberg; and that the ordinances of France require it to be spun, for its distinction from the gilt silver, on flaxen or hempen threads. The Chineses, instead of flattened gilt wire, use slips of gilt paper, which they both interweave in their fluffs, and twit upon silk threads; but whatever be the pretended beauty of the fluffs of this kind of manufacture, it is obvious that they must want durability; accordingly, the Chineses themselves, as we learn from Du Halde, findible of this imperfection, fearlessly use them any otherwise than in tapestries, and such other ornaments as are not intended to be much worn or exposed to moisture.

The Venetians have carried on a large trade, to the Levant, in a kind of brocade called damosquett, which, though
though it has only about half the quantity of gold or silver as that made among us, looks far more beautiful. The flattened wire is neither wound close together on the flilk threads, nor the threads bruk close in the weaving; yet, by passing the flulk between rolls, the disposition and management of which is kept a secret, the flilk or fluker is made to appear an entire brilliant plate of gold or silver. The French ministry judged this manufacture important enough to deserve their attention; and accordingly, for contriving the machinery, they engaged the ingenious M. Vaucanson, known throughout Europe for his curious pieces of mechanism, who, in the memoirs of the academy for the year 1757, gives an account of his success, and of the establishment of such a manufacture at Lyons.

The lower roll is made of wood, thirty-two inches in length and fourteen in diameter; the upper one of copper, thirty-six inches long and eight in diameter: this last is hollow, and open at one end, for introducing iron heaters. For making the rolls cylindrical, he has a particular kind of lathe, wherein the turning tool, which the most dexterous hand could not guide in a straight line through such a length as thirty-six inches, is made to slide, by means of a screw, on two large fixed rules, perfectly straight, and capable of being moved at pleasure, nearer, and always exactly parallel, to the axis of the roll.

He first disposed the rolls nearly as in the common flukting-mill. In this disposition, ten men were scarcely sufficient for turning them with force enough to duly extend the fluld; and the collars, in which the axes of the rolls turned at each end, wore or galled so fast, that the pressure continually diminished, insinuating, that a piece of flulk of ten ells had the flulding sensibly less extended on the left part than on the right. He endeavoured to obviate this inconvenience by screwing the rolls closer and closer in proportion as the flulk passed through, or as the wearing of the collars occasioned more play between them; but this method produced an imperfection in the flulk, every turn of the screw making a sensible bar across it. To leffen the attrition, each end of the axes, instead of a collar, was made to turn between three iron cylinders called friction-wheels: but even this did not answer sufficiently, for now another source of unequal pressure was discovered. The wooden roll, being compressible, had its diameter sensibly diminished; it likewise lost its roundness, so that the pressure varied in different points of its revolution. On trying different kinds both of European and Indian woods, all the hard ones split, the soft ones warped without splitting, and, of more than twenty rolls, there was not one which continued round for twenty-four hours even without being worked in the machine.

These failures put him upon contriving another method of pressing the rolls together, so that the force should always accommodate itself to whatever inequalities might happen. The axis of the copper roll being made to turn between friction wheels as before, that of the wooden one is pressed upwards by a lever at each end furnished with a half collar for receiving the end of the axis. Each lever has the end of its short arm supported on the frame of the machine, and the long arm is drawn upwards by an iron rod communicating with the end of the short arm of another lever placed horizontally: to the long arm of this last lever is hanging a weight, and the levers are so proportioned, that a weight of 30 pounds presses the rolls together with a force equivalent to 17330 pounds, which was found to be the proper force for the sufficient extension of the flulding. By this contrivance four men can turn the rolls with more ease than ten can turn those which are kept together by screws; and the same weight acting uniformly in every part, the pressure continues always equal, though the wooden roll should even become oval, and though the flulk be of unequal thickness.

A piece of cloth, of about two ells, is passed to the beginning and end of the flulk, to keep it out to its width when it enters and parts from the rolls, which could not be done by the hands for fear of burning or bruising them: as it would take too much time to few these cloths to every small piece of an ell or two, a number of these is fewed together. The flulk is rolled upon a cylinder, which is placed behind the machine, and its axis propped down by springs to keep the flulk tight as it comes off. Four iron bars, made red hot, are introduced into the copper roll, which in half an hour acquires the proper degree of heat, or nearly such a one as is usual for the ironing of linen: the wooden roll is then laid in its place, and the machine set to work. If more than thirty ells are to be passed at once, the wooden roll must be changed for another, for it will not bear a longer continuance of the heat without danger of splitting, and therefore the manufacturer should be provided with several of these rolls, that when one is removed, another may be ready to supply its room: as soon as taken off from the machine, it should be wrapt in cloth and laid in a moist place.

The principal inconvenience attending the use of this machine is, that the heat necessary for extending the flulding, though it improves the brightness of white and yellow silks, is injurious to some colours, as crimson and green. A double pressure will not supply the place of heat, and the only method of preventing this injury, or rendering it as little as possible, appeared to be to pass the flulk through with great celerity.

Rich brocades may be cleaned, and the luster of them recovered, by washing them with a soft brush dipped in warm spirit of wine.

Neither alkaline liquors nor soap should be used for this purpose; because the former, while they clean the gold, corrode the silk, and change or discharge its colour, and the latter also alters the shade, and even the species of certain colours. But spirit of wine may be used without any danger of its injuring either the colour or the quality of the subject, and, in many cases, it proves as effectual for restoring the luster of the gold, as the corrosive detergents.

Spirit of wine seems to be the only material adapted to this intention; however, this is not proper in all cases: for if the base metal, with which the gold of the covering was alloyed, has been corroded by the air, the particles of the gold may thus be diffused; and the silver underneath, tarnished to a yellow hue, may continue a tolerable colour to the white; but in such cases the removal of the tarnish would be prejudicial to the colour. See Lewis's Com. Philos. Techn. p. 62. 226.

Brocade-Silk, in Costume, a trivial name given sometimes to Conus Geographicus, Linn. In a more general sense, the epithet brocade, synonymous with the French brocard, is applied to various other objects of natural history, whose disposition of colours, and markings, bear a fancied resemblance to that fort of flulk, flilk, cloth, and which is commonly understood by the word brocade. Brocard among the French, and brocade with us, is not, therefore, the language of naturalists, but of dealers, and unscientific collectors.

Brocardics, Brocadica, denote maxims or principles in Laws such as those published by Azo, under the title of Brocadica Juris.

Voilus derives the word from the Greek episcopen, q. d. first elements. Others, with more probability, from Bur- chard, or Brochard, bishop of Worms, who made a collection of canons, called from hence Brocardica; and as this work
work abounded much in sentences and proverbs, the appellation brocaded became hence extended to every thing.

BROCADEL, called by the French brocadé, an ordinary kind of stuff made of cotton, or coarse silk, in imitation of brocade; chiefly used for tapestry and other furniture. That manufactured at Venice is the most esteemed.

BROCATELLO, a name given by lapidaries to a calcareous stone or marble, composed of fragments of four colours, white, grey, yellow, and red.

BROCO, in Geography, a town of Naples, in the county of Lavora; 5 miles W. of Capua.

BROCCOLI, in Botany and Gardening. See Brassicaceae.

BROCHOS, in Surgery, is a term of doubtful signification. It has been considered by some as a Greek name for the Epercius, or roots; and by others, as denoting bandages in general. Calcines informs us, that this word relates to certain chirurgical instruments; and he refers to the authority of Galen and Oribasius. It has also been considered as expressive of a privation of voice, or aphonia. Persons having a very large and prominent upper lip, have been denominated brochos; although Dr. Turton, in his Medical Glossary, says that brochos signifies one who has "the chin and neither by flicking out." 

BROCHRUS, in Ancient Geography, a town of Phœnicia, seated near a marsh, between Libanus and Antilibanus. Polybius.

BROCK, among Sportsmen, sometimes denotes a badger, otherwise called a grey brock.

Brook, and broccoli, are also used to denote a hart of the third year.

BROCKDROP, in Geography, a town of Germany, in the circle of Lower Saxony, and duchy of Holstein; 6 miles W. of Krempe.

BROCKEL, or Brakel, a town of Germany, in the circle of Westphalia, and county of Verden; 5 miles E. of Rothenburg.

BROCKEN. See Harz.

BROCKLESBY, Richard, in Biography, who attained to considerable eminence, and acquired a splendid fortune by the practice of medicine in London, was of a respectable family of Cork, in Ireland, but was born at Minhead in Somersetshire, where his mother was on a visit to one of her relations at the time of his birth. This happened on the 11th of August, 1722. His parents were Quakers; but it does not appear that they were solicitous to initiate him in the principles of that sect. At an early age he was sent to a famed academy at Ballytore, in the north of Ireland. There he formed an intimacy with Edmund Burke, which was improved into the most cordial friendship when they met together afterwards in London. Having completed his school education, he went to Edinburgh, and after attending the lectures of the professors in the different branches of medicine there, he proceeded to Leyden, and took his degree of doctor, under the celebrated Gaußius, in June, 1745, giving, for his inaugural thesis, a dissertation "De Saliva fusa et morbosa." The following year he came to London, and settled in Broad-street; and as the income allowed him by his father was not large, and he found that sum not much increased, for the first few years, by the profits of his profession, he determined to regulate his expenses in such a manner, as to secure him from the misery of dependence. "Never sufferer himself, as he was used to have a want that was not accommodable to his fortune." The same year he published an Essay concerning the Mortality of the Horned Cattle, which contributed to extend his name and character. In 1751, he was admitted a licentiate in the Royal College of Physicians, in London. In 1754 he received an honorary degree of doctor in medicine, from the university of Dublin, and the following year he was admitted by the university of Cambridge, ad eundem. He then became a candidate, and in June, 1756, was elected a fellow of the College of Physicians. As his practice was not much increased, and by the prudence of his conduct, and the frugality of his manners, he had concluded to himself the friendship of his professional brethren, he was, by their recommendation, appointed physician to the army by Lord Harrington. In this capacity he went to Germany, and continued there, until a few months before the conclusion of the war, in 1757. The following year he published the result of his observations and practice, under the title of "Economical and Medical Observations, from 1738 to 1752, tending to the Improvement of Medical Hospitals." 8vo. He now returned to London, and settled in Norfolk-street, in the Strand. His fortune was by this time increased by an estate of £1,000, per annum, which devolved to him on the death of his father; and the duke of Richmond, and five other noble personages, agreed to give him penions of 100l. per annum each, as a recommendation for attending their families. This, with his half pay from the army, made up a handsome income; and as he possessed the modestly virtue, as dear Swift calls it, discretion, he was enabled to keep a carriage, and to live with some degree of splendour. Soon after he was made a fellow of the Royal Society; and not being incumbered with a family, he dedicated what time he could spare from attending his patients, &c. to reading, or to associating with persons eminent for literature and science. On his suggestion, a professorship in chemistry was added to the establishment of the college at Woolwich; and on his recommendation the late Dr. Adair Crawford, author of an ingenuous philosophical treatise on heat, was appointed the first professor. Though it has been intimated, that the doctor's habits were frugal and economical, yet there are abundant proofs he was not deficient in liberality. On being informed that Dr. Johnson, with whom he cultivated a first intimacy, wished, in the latter part of his life, to visit the continent for the recovery of his health, but was restrained from going, by the narrowness of his circumstances, he, in a handomely and delicate manner, made him an offer of an annuity of 1,000l. per annum for the remainder of his life; and on Dr. Johnson's declining to accept the offer, he prevailed to reside in his house, as more airy and healthy than that in which he then lived. To his friend Edmund Burke he sent 1,000l., which he told him he had intended leaving him at his death, but thought it might then come to him, at a time when it would be of little use. The present was accepted, in a manner which showed that the doctor was strong in his conjectures. In the year 1794, finding the infirmities of age more than fell upon him, he gave up his half pay in the army, and declined, excepting among his particular friends, visiting patients. A little before this time, his patron and friend, the duke of Richmond, had appointed him physician general to the royal regiment of artillery, and corps of engineers. This he retained, as giving him an occasion of going to Woolwich, and visiting the laboratory there, to which he was attached. In the beginning of December, 1797, he went to Beaconsfield, to the house of Mrs. Burke, the widow of his deceased friend, where he continued a few days, and returned on the 11th of the month, to dine with his two nephews, Mr. Bosin and Dr. Young, the charge of whose education he had taken principally upon himself. Though much fatigued with his journey, he appeared pleased with the interview, Z so and
and supported this part of the conversation with carefulness. At noon he retired to rest, but found the labour of going up stairs almost too much for him; and observed, "What an idle piece of ceremony this buttoning and unbuttoning is to me now!" After having some minutes in a chair to recumb himself, he went to bed, and in a few minutes quietly expired. His fortune, which is said to have exceeded 350,000, was left between his two nephews, a few legacies to friends and distant relations excepted.

As Dr. B. was of a quiet and peaceable disposition, he was not likely to enter into any serious broil; he was, however, at one time, obliged to accept a challenge. The occasion was this: the late doctor, afterwards Sir John Elliot, in the course of his attendance on a patient with Dr. B., had made use of means to obtain the favour of the family of the patient, which were not compatible with the character of a gentleman. Of this Dr. B. talked openly, and the expectations he had on the occasion were reported to Dr. Elliot, with an intimation, that if he did not insist on an apology from his antagonist, no one would, hereafter, meet or associate with him. A duel was the result, which, however, terminated without the effusion of blood, the seconds having taken care to place the combatants at such a distance, that their balls, if they should hit, would do no mischief.

Besides the works mentioned before, Dr. B. was author of "Oratio Harveniana," published 1765, 4to; "An Account of a poisonous Root lately found mixed with Gentian," Phil. Trans. No. 485; "Experiments on cutting the Tendons, in various Animals," ibid. vol. 43; "Cafe of a Lady labouring under Diabetes," Med. Obs. vol. 3; "Experiments relative to the Analysis of Seltzer Water," ibid. vol. 4; "Cafe of an Enchanted Man," ibid.; and "A Dissertations on the Music of the Ancients," supposed to be written in the early part of his life.

BROD, a fortified town of Slavonia, seated on the Save, and famous for a victory gained over the French in 1658. N. lat. 45° 20'. E. long. 18° 36'.

Brod, Bonifex, a town of Bohemia, in the circle of Kravizzi; reduced to ashes in 1637, and since rebuilt; 7 miles N.W. of Kravizzi.

Brod, Tusek, a town of Bohemia, in the circle of Czałza, on the Sazava, taken by the allies in 1743; 20 miles S.S.E. of Czałza.

Brod, Ungarjb, a town of Moravia, in the circle of Hraditz; 8 miles S.E. of Hraditz.

BRODEAU, John, (Lat. Brodeus), in Biography, a learned critic, was born at Tours about the beginning of the 15th century, and having studied law at Bourges under Alecrins, devoted himself to the belles lettres. He travelled into Italy, and formed connections with Sadelet, Dumesct, Mauvetius, and other literary characters. After his return to France, he distinguished himself by several works of criticism, the principal of which is a collection of observations, corrections, explanations, &c. of ancient authors, entitled "Miscellanea." The first six books of this work were published in the second volume of Gruter's "Lampas, feu Fax Artium," in 1604; and the four latter books in the fourth volume of the same collection. In his notes on Lucanides, he has been charged with plagirism. He was also versed in mathematics, and the oriental languages, as well as classical literature. He died at Tours, where he was canon of St. Martin, in 1563. Gen. Dict.

BRODENFELD, in Geography, a town of Germany, in the circle of Upper Saxony, and territory of Vogland; 3 miles E. of Oelfnitz.

BRODERA, a fortified town of Hindoostan, in the country of Guzerat, situated on the small river Dader, in the north-east part of the tract lying between the rivers Taptie and Mhiee, through which the great road leads from Surat to Ongreen. This is a modern town in comparison with several others, having been built by the son of the last king of Guzerat, near the site of an ancient town, formerly called Rapiore, but now Old Brodera, which is entirely gone to decay. It stands in a very fertile, though sandy, country, has good walls and towers, and is full of architects, who manufacture the finest fluffs of Guzerat, bafts, tibanches, cannaquis, chiloes, &c.; and the cottons of Brodera are finer than those of Bapooch, but narrow and shorter. Indigo is also an article of trade in this place, and the vicinity supplies gun-lace. The Dutch factory established at Brodera in 1626, was abandoned before the year 1670. N. lat. 22° 15'. E. long. 73° 11'.

BRODERIES, Fr. a term in Music for embroidering or gracing a melody. It is equivalent likewise with doubles, variations, flourishes, or flourishes for adorning an air. All these terms are used for the notes of music which the performer adds to his part in the execution, to vary a melody often repeated, to embellish passages too plain and simple, or to shine by the activity of throat or finger. Nothing manifests the good or bad taste of a musician, says Ruffeau, more than the choice and application of these ornaments. French vocal performers were very sparing of their broderies or graces in the middle of the last century; for if we except the celebrated Jellote and mademoiselle Fel, no French singer durst venture to make a single change in his part on the stage. French melody had been for some years growing more flow, and lamentable, that it was capable of no improvement by graces. The Italians are unable to execute a melody quite plain; they give full scope to their memory or fancy, and try who can make the greatest number of changes: an emulation often absurd, and carried to an offensive excess. However, the accents of their melody are so strongly marked, that there is little fear of the air being so disguised, as not to be recognizable through all the performers' redundances.

With regard to instruments, a solo player may do what he pleases; but a performer in a full piece, who dares embroider his part, was never suffered in a good orchestra.

BRODETZ, in Geography, a town of Bohemia, in the circle of Boldlaw; 5 miles S. of Jung Buntzlaw.

BRODIATORES, in the Middle Age, a kind of libri, or copies, who did not write the words and letters plain, but variously flourished and decorated, after the manner of embroidery. Du-Cange Gloss. Lat. tom. 1.

BRODNITZ, in Geography, a town of Prussia, in the bishroip of Culm; 30 miles E. of Culm.

BRODOW, a town of Germany, in the circle of Lower Saxony, and duchy of Holstein; 43 miles N.E. of New-flatt.

BRODY, a town of Poland, in the pateniate of Lemberg; 30 miles S. of Lucko.

BRODZEC, a town of Lithuania, in the pateniate of Minis; 48 miles E. of Minis.

BROECK, Crespin Vandcn, in Biography, a painter and engraver, was native of Antwerp, and flourished about the year 1560. As a painter, he had some reputation in the historical line; but the prints engraved from his designs, which are numerous, evince him to have been a man of genius and great fertility of invention. Among the engravings that are attributed to him, is the "Circumcision of Chrifi," in chiaro-scuro; the outline of which is etched in a bold free manner on copper; and the block of wood, which produces the lighter tints,
tints, is so contrived as to imitate the hatchings of white chalk upon the lights.

The daughter of this artist, viz. "Barbara Vanden Broeck," learned to draw of her father, and was probably instructed in the art of engraving in the school of the Colverts. Her progres, however, was such as to reflect no small credit on her talents. Mr. Strutt notices the following plates of her execution; the "Lait Judgment," done altogether with the graver, and in the style of Martin Rota; a "Holy Family," with St. John and several angels; and another "Holy Family," with St. John kneeling, and attendant angels. Published by Hendius, A.D. 1621.

BROECKHUYSE, JOHN, Lat. Brouckhuyssen, an elegant scholar and Latin poet, was born at Amsterdam in 1649. Difliking the profession of an apothecary, to which he was apprenticed, he left his master, and entered on board an India ship; and by degrees became master of an armed vessel. In this situation he felt an inclination for letters and poetry; and, by the advice of Grauits, applied to the study of the Latin language, of which in a few months he made himself complete master. He afterwards abandoned his sea-faring employment, and devoted himself with ardour to classical studies. While he was on board his ship, he wrote several pieces, one of which was entitled "Cedalon, or Impatience to revisit his Country," and a collection of his poems was published at Utrecht in 1684, by which he acquired great reputation. As a critic, under which character he excelled, he published valuable editions of Sannazarus, Propertius, Tibullus, and Anonius Palarius. He also translated into Latin father Rapin's "Parallel of Homer and Virgil." He died in 1707, and a monument was erected to his memory at Amsterdam, where he was interred. A splendid edition of his poems in 4to. was published at Amsterdam, in 1711. Moreri. Gen. Biol.

BROECKHUYSEN, BENJAMIN VAN, a Dutch physician of considerable learning and ingenuity, of the 17th century. After taking his degree of doctor in medicine at Leyden, he was made physician to the armies of the republic, and then physician to the fort and town of Bois le Duc. He was also known and esteemed by king Charles II. of this country, when resident in Holland.

His works are, "Economia Corporis animalis, seu Cognitiofationes succincte de Meente, Corpore, utriusque Conjunctione," Noviomagi, 1672. "Economia animali ad Circumnicationem Sanguinis breviter delineata," Gouda, 1687, 8vo. He was a follower of the stylem of Des Cartes, and maintained that the blood was heated in the heart by fire actually resident there; and to this he attributed the impulse it received, and which maintained and supported its circulation. "Rationes philosophico-medicae," Haag, 1687, 4to. written in a florid and poetical style, explaining the animal economy on Cartesian principles. Haller. Bib. Anat. Eloy. Dict. Hilt.

BROEK, ELIAS VANDEN, a painter, was born and educated at Antwerp in 1657, and became the disciple of Erasul Stuven, and studied De Heem, says Houbraken, or of Mignon, according to Defamps. He painted, in a loose, easy, and natural manner, all sorts of fruits, flowers, frogs, and reptiles. He designed and coloured every object after nature. Brock died in 1711. Pilkington.

BROEK, in Geography, a town or rather a large village of North Holland, distinguished by the elegant neatness and beauty of the houses and streets, and also of the inhabitants. The houses, which are built of wood and covered with tiles, are painted and ornamented on the outside with a variety of vivid colours, according to the fancy of the owner; and the windows are generally fashioned and decorated with curtains.

The inside of the houses is also equally neat and embellished. In the fronts of most of them are agreeable gardens, diversified with gravel walks, shell-work, images, and little hedges, or painted rails. The streets are paved with bricks, and waded by rivulets that pass by the sides of the houses; and in order to their being kept clean, they are too narrow to admit of carriages, nor are cattle suffered to pass through them. The fame attention to neatness and ornament is manifest in the environs of Brock. The town is chiefly inhabited by persons who have retired from business, or who are connected with some commercial houses at Amsterdam. The females are beautiful, but singularly reserved, particularly among strangers. The principal articles of trade are cattle and corn. Brock is distant one league W. from Monikedam.

BROERS BANK, lies on the coast of Holland, across a village of the same name, and the cloyster of Ten Duyns, running W.N.W. about a league into the sea.

BROEUCQUES, JOHN FRANCIS DU, was born at Mons, in 1690. At a proper age he was sent to Louvain, and in 1712 was admitted doctor in medicine; having finished his studies there, he returned to Mons, where he was much esteemed for his professional abilities, and continued practising to the time of his death, which happened suddenly, July 11th, 1749. He published in 1725, in 12mo. "Reflections sur la Methode de traicter les Maladies par le Quinquina." In this he combats, and successfully, some of the prejudices still remaining against the use of that medicine. "Preuves de la Necessite de regarder les Urines, et de l'utilage que les Medecins on doit faire pour la Guerison des Maladies," 1729.

BROEUCQUES, ANTHONY FRANCIS, one of the sons of the former, took his degree in medicine at Louvain in 1747, and on the death of his father succeeded to his practice, in which he continued until 1767, the time of his death. Two small useful works, the result of much practice, were published by him: "Diffours sur les Erreurs vulgaires, qui se commettent dans le Traitement des Enfans," Mons, 1754, 12mo. "Reformation des Erreurs vulgaires sur le Regime que la Medicine preferit aux Malades et aux Convalescents," Mons, 1757, 12mo. Eloy. Dict. Hilt.

BROGLING, a method of fishing for eels, otherwise called SniGGLING.

BROGLIO, or Broy, in Geography, a town of Piedmont, in the county of Nice, 15 miles N.E. of Nice. N. lat. 44° 12', E. long. 6° 42'.

BROGNE, a town and abbey of the county of Namur; 10 miles W.S.W. of Namur.

BROILING, or Baking, in Geography, a town of European Turkey, in Livadia; 22 miles N. of Livadia.

BROKEN, among Painters, a colour is said to be broken, when it is taken down or degraded by the mixture of another.

BROKEN, or Clay-Crash, in Geography, an Indian town in the Creek country, in West Florida, on the west side of Chataucha river; 12 miles below the Cuffitah and Coweta towns, where the river is fordable.

BROKEN BACKED, in Sea-Language, denotes the state of a ship which is so impaired and loomed in her frame, as to droop at each end; a disorder to which the French ships are most exposed, on account of their length, &c.

BROKEN BAY, in Geography, a capacious inlet, being the estuary of the Hawkesbury and other rivers, on the eastern coast of New Holland, about 8 miles to the northward of Port Jackson. S. lat. 33° 26', E. long. 151° 27'.

BROKEN ISLANDS, a name given to an assemblage of rocky eminences,
eminence, for the most part barren, situate on the coast of Arman, in the Left Innes, and affording shelter only to pirates and thieves. N. lat. 16° 30'. E. long, 94° 28'.

Brown's Notes. Among Horse-jarstia, broken knees are a mark of a humbler.

Brown's Notes, in Aristarchus. See Number and Fracture.

Brown's Fen, in District, the same with ray of Refraction, &c.

Brown's Horse, in Veterinary Science, a disease frequently seen among horses. The following are the indications which exist in its presence. The breathing of the horse increases from its natural rate, and from an easy, gentle, and regular inspiration is changed to a painful, laboured, heaving, and jerking act of the breaths, which rise by several sudden forcible as a respiration to a pretticular height, then suddenly relax and fall backward beyond the natural extent of these parts; the cheeks become hollowed, and held rigid and opened to an unnatural extent, and the face becomes every where contorted and contracted; such are the appearances in very acute cases; in more recent cases these appearances are less evident, and it is a disease that can exist in every degree of mildness or violence.

When the disease has been of long standing, and little pain or care is taken with the animal, it may be more particularly observed in ease horses, and horses employed in farmer's work in the country, the abdomen becomes large and pendulous; but in more recent cases, and in horses otherwise situated, we have observed that, in the early stage at least, the abdomen is rather contracted and is painfully held up in this disorder.

Great thirst attends this disease, perhaps arising from the increased action or fever which it occasions, and this has been too often mistaken for the cause of it, and has led to the most cruel privations.

There is no disorder, perhaps, of the horse, which has so much engaged the attention of anatomists and of speculative minds as men, as this, to discover its cause. It has, however, we believe, never yet been satisfactorily explained: at least, there is no author that we are acquainted with that has formed any connected or probable account of it, unless perhaps very lately, and which was derived from the source we are about to mention.

Haller seems to have suppos'd it proceeded from a relaxed or ruptured diaphragm. Lower imagined that a relaxation or injury of the phrenic nerves might occasion it; some have affected it, after examination, that the lungs are not at all affected in this complaint, and that its seat was about the lungs and air-passage; and some of the writers on this subject have believed, that the lungs were grown too big for the chest, and that this was the source of the mischief, and there have been many other conjectures equally absurd. Some thought they elucidated the nature of this disease by comparing it to a consumption, and others to an althmia. We trust something more natural and satisfactory will be found in the following statement of our observations on this singular disease.

In the year 1725, being engaged in the dissection of a grey mare that was sent to the veterinary college to be destroyed on account of this complaint; on opening the chest, the lungs appeared free from inflammation, being very white; and, as it appeared free from redness and increase of colour, the general concomitant of disease, we were led for a while to consider the lungs as not the seat of the disorder, as others had done (for several of the pupils were present at this dissection). On cutting into its substance, no inflammation was perceivable; on examining them more closely, we observed a small bladder or vesicle on the outside of the lungs, the external involution pleuris coat; this was convected by some who were present to be a tuberelle, and that tuberelles might be the cause of the broken wind. Suspecting, however, from its appearance, that it was not solid, but contained air, it was punctured, and it immediately subsided. This instantly suggested to the writer of this article, that the lungs were actually in a state of emphysema, or that air was contained in a state of extravasation in their substance, and which not only seemed evidently the cause in this instance, but we have since fully verified it by examination and dissection of a considerable number of cases of broken wind, and found that it is the constant appearance. This extravasation of air in the substance of the lungs is perhaps occasioned by a rupture of the air-cells, as suggested by Mr. Coleman at that time, unless it is formed in them, and thrown out by some morbid operation of the blood-vessels, as sometimes happens in the intellines and vasa; for the exact way in which this emphysema arises has not been yet ascertained. It fully explains the cause of the white appearance of the lungs, the membranes being separated and divided; the air lying between them partially admit the light, also the puffy appearance they make, and the crackling noise they give on their being handled; all admit of a ready explanation by this discovery, and do the symptoms which attend the disorder; the common air escaping, from disease, or a sudden rupture of the cells, into the membranes composing the lungs, thereby compresses and obliterates more or less the natural cavities defined for the reception of the air, and thus occasion the effort we observe to overcome this obstruction, and which naturally induce the appearances we have described as the symptoms attending this disorder; it also accounts for its incurability, and the oppression which a full stomach occasions. As the extravasation proceeds, the complaint gradually, or sometimes suddenly, increases, so as to be intolerable to the animal; and at length being quite useless, he is necessarily destroyed. In some cases, the disease, without much increasing, may exist for many years; and till the horse dies from other disease or age. This white appearance of the lungs it is that had deceived for so long those who had been led through curiosity to examine the lungs in this complaint; it being so unusual to see any part in a state of disease more delicately white than in its healthy state; and singular it is, that the extravasated air should not bring on the inflammation and destrution of these organs.

Horses, in bad cases of broken wind, are observed to void air in considerable quantities by the anus, as though the extravasated air of the lungs was absorbed and carried to the intestines; or it is probably only indigestion which is the cause of this: and the smiths, not unfrequently, on this account, cut through and divide the sinew at the hind leg, then the power of closing the rectum is lost, and the air escapes without any noise; and they are led from hence frequently to imagine they have cured the complaint.

We are now led to consider what the cause is, which in the general estimation of mankind leads horses to this disease, viz., their being allowed too much water; and here, we apprehend, every observer of common sense and humanity must be shocked at the recollection of what infallancies have fallen within his own observation of cruelty in this respect, and of what horses are daily and hourly suffering from the most barbarous of all customs, the denying of a sufficiency of water to found horses to prevent their becoming broken-winded. True it is, that water administered to horses in an improper manner, especially after the privation above spoken
spoken of, may become a cause of their being broken-winded; but would any one infer from this, that it is necessary that all horses should be kept almost entirely without water, exposed to a never-ceasing thirst, till an opportunity of gratifying the appetite in this way occurs; and the natural and healthful beverage being too largely taken, becomes a poison, and induces the very mischief which so much cruel and unfeeling pains had been taken to avoid; for the horse that is allowed to drink frequently and as much as he likes, will never from this source become broken-winded. No horse on a common, exposed to the water of the brooks, which he can partake of as often as he pleases, will ever become broken-winded from this cause, unless he had previously suffered a privation of water, and, in his first excels to overcome his thirst, had injured himself. Let us now consider, under what circumstances it is advantageous to deprive a horse, for a time, of his water. The traveller, who starts in the morning on his journey, would be incommoded, if the horse's stomack was loaded with water; it is quickly absorbed from the stomack, and passing off in perspiration, becomes unwholesome and troublesome; and though it may be true, that perspiration is not too heavy, by keeping a moisture on the skin, and by its evaporation, induces a coolness that might be refreshing, yet to be inundated with it would be highly disagreeable. The water should, therefore, be given at an earlier hour in the morning, and should have time to pass off before the horse is used on the road; and if he be deprived, in a great measure, of it during the day, he should be the more plentifully supplied with it during the night-time, so as not to create a violent thirst, which can only be gratified, the first opportunity that happens, at the expense of his health, or perhaps his existence.

Sorry should we have been, if, after much inquiry into the nature of this disease, we should have discovered that the above practice of depriving horses almost entirely of water, though cruel, was necessary; and that we must acquiesce, with painful sensations, in the use of this custom. We are, on the contrary, convinced from experience, as well as the most incontrovertible reasoning, that the practice is as destructive and pernicious, as it is cruel and unnatural; for we are aware, the suggestions of humanity would avail but little, where an opposite course would best serve the interests of mankind in regard to this animal; however, they are, fortunately for it, not inconsiderable; on the contrary, all the comforts he can receive will blunt his irritations and labours.

It should be recollected that the horse is fed on the dryest food, as corn, beans, bran, hay, &c. and this requires, to its being well digested, a certain portion of moisture, which must be either derived externally, or from the blood; and horses are often expected to work hard under these circumstances, to sweat and perspire profusely, and digest their food as well, without any water; the consequence of this is, that their dryness and thirst must arrive at a pitch that is scarcely governable; and to these cauas we may add, as contributing to the mischief, the hot, crowded, low-ables of large towns and cities, where they are often, in consequence of such treatment, seized with various inflammatory complaints, as affections of the limbs, eyes, brain, and lungs, and other diseases. They are sometimes miserably allowed to wet their mouths on the road, and this is deemed sufficient for their wants; or, if they by any accident get to water, the consequences ensue that we have above described.

With chaises and post-coaches are ever seen the greatest number of broken-winded horses, because the artificial and mischievous system purveyed by the drivers of such vehicles naturally lead to it. It is a practice with the brewers' dray-horses, both in the metropolis and the country, as often as they come home, to let them go to the trough and drink their fill; among these broken-winded horses are very rare, though they have all the water they can desire.

Filling horses all over with cold water, while in a profuse sweat, we believe not to be so injurious a custom as would at first appear, if the law for its application is understood, but, on the contrary, very beneficial and refreshing. Tho' those who do it should be apprized of the danger of carrying it to the extent that would chill the horse, when the worst confections would often ensue: to avoid ill effects, the horses, after this bathing, should not be left long to stand still and chill, or in any cold place, or draft of air; but while his skin is yet warm, (in the case of a return chaise,) he should be put in, and drove home, till again perspiration is fully induced upon the skin, when all danger would be prevented; and it would be best, perhaps, not to repeat it, at least to the same extent, on his arrival home: as he is then to stand still in the stable, there would be some risk of inflamed lungs, inflamed feet, or the gripes, from the blood being confined in the interior of the system.

Muddy water is often conceived to be best for horses, and is given them in preference by some grooms. A horse, however, must arrive at an extraordinary degree of thirst before he would touch it; and it is only better, as being in general warmer, having been exposed to the air and sun, and is certainly safer for horses than water drawn from a cold spring or deep well; the contrast of temperature being too great with the horse heated by violent exercise.

When the cause of any disease is not understood, the theories for its explanation will be vague and unsatisfactory, and the remedies various, often opposite, and almost infinite, and so it has been with this complaint; for there is nothing can equal the absurd nostrums recommended in books of farriery, in this complaint in particular, as well as in some others; and the farther we go back, the more sure and found is the information respecting it. The ideas of the Romans were coarse and absurd; but the Greeks appear to have had a better knowledge of it, as seen from the following translation given by Kueutus: "Cum in pulmonibus quid rumpi caperis, hoc est ut pulmonis et maximi Grahis acqua pulmonis ruptionis applanatur," and it is afterwards much better described, in a chapter given by Theonellus in the same work, and at considerable length, too much to do at a moment in this place. Whether, however, the term "Pulmonis ruptionis" did really convey to their ideas the actual cause of the disorder, may be doubted by the context, any more than broken-wind to an Englishman, or Chval pouoff to a Frenchman. The ancients appear to have had a belief in its being cured, especially before it became inveterate; the remedies they mention, however, may be fairly suspected of poftulating any such power.

We cannot conclude this article more usefully to the public than by cautioning them against a common practice, especially among the lower order of horse dealers, of violently squeezing the wind-pipe and throat, to ascertain if a horse be broken-winded, which is often attended with the most mischievous consequences; the cough will be in proportion to the violence of the irritation used, and this even in cafes of broken wind, unless in the last stage of it, when other symptoms sufficiently denote it; so that, as a criterion, we believe it to be of little value.

A grey poney was brought to the Veterinary College, during the professorship of M. St. Bel' in the year 1791, with great difficulty of breathing, a copious discharge of saliva from the mouth, and a running at the nose; so far it appeared somewhat like glanders; but the glands under the jaw
jaw, and all the external parts of the throat, were free from
swelling.

The difficulty of breathing was considerable, and threat-
ened suffocation; this induced us to suppose some obstruc-
tion was the cause, either in the nostrils, faucies, or larynx.
The operation of bronchotomy was had recourse to, which
immediately relieved him: present suffocation being
thus prevented, our next plan was to remove the obstacle,
which we imagined might be in the nose. The frontal
bone was trepanned, and it was intended to trepan the
nasal bone, but this was not executed, for the pus from
the former found its way through into the nose, and the
nostril was injected every day, through this opening, with a
warm decoction of herbs. As the orifice in the trachea every
day became smaller, it was difficult to keep in the canula,
which accidentally a few days after falling out, the horse
was suffocated and expired. On opening the head, there
was no obstruction any where to be found; on opening the
larynx, the true cause was discovered.

The internal membrane that lines the larynx, or wind-
pipe, was enlarged or dilated with a fluid, in a way that
prevented the admission of air. This membrane was
detached from the sides of the larynx, and to dilated, that
the two portions met each other in the centre of the pipe,
forming two hemispherical tumours, which acted as valves,
and completely excluded the admission of air. On cutting
into these tumours, they were composed of cellular membranes,
dilated by a small portion of fluid; the surrounding parts
did not bear any marks of inflammation. If these tumours
had formed on one side only, they might have been
attributed, perhaps, to some puncture, or some injury from
bleeding, or other cause of this sort; but being on both
sides of the throat, it is probable both sides must have been
irritated, to produce it, and nothing so likely as violent
compulsion of that sort we see men use when they propose
to try horses for broken wind; for they endeavour to squeeze
the pipe till both sides meet, otherwise the horse will not
cough, or only slightly. Since this, another exactly similar
case was brought to one of the slaugther-houses of town,
while we were casually laying there, and the horse was said
to die of suffocation, they could not tell why. On examining
the larynx, a similar mischief was discovered.

During the last five years, we have opened more than 10
horses that were broken-winded, and uniformly found the
lungs emphysematous: violent breathing and appearances,
in every respect like broken wind, attend other affections
where the lungs are injured, as in large abscesses forming in
the lungs, water thrown out in the chest in roasters, and
even violent pain in any part of the body, will produce
appearances resembling broken wind, which again disappear
when those affections are removed.

When the stomach is loaded, especially with water, all the
symptoms of this disorder are more easily remarked, especi-
ally on exercise; it is, therefore, one of the most sure means of
ascertaining it; and on this account horses with this com-
plaint, are in general kept from drinking great quantities
of water, which they are much disposed to do, probably from
the fever observed to attend the complaint, and also, perhaps,
from the blood in the lungs not undergoing so completely
the changes it ought to do in that vice.

Some horses are differently affected in broken wind to
others: the respiration is quickened in some without much
heaving, and the abdomen in such is contracted and hard,
instead of being large and pendulous. It is sometimes
attended with a cough, which is not deep, but short and
hard, as though the lungs refilled perfectly the impulse
of this exertion. On exercise the cough is much increased,
after which he seems relieved; the head in coughing is held
low, his neck stretched out as though he endeavoured to
bring something from his throat: "quaest officia deco-
rufa?" the face has a rigid emaciated appearance,
resembling, though less violent, that contraction which
attends lock jaw. The eyes are often yellow from diffused
bile; the nostrils dilated and rigid. The appetite is not
affected by it, if anything it is increased.

The writer of this article endeavoured to rupture the cells
of the lungs of a found horse, by inflating them, and laying
weights upon them, and found that no moderate preasure
would do it; indeed when removed from the body, no expe-
riment could be very satisfactory, and he desisted from
further experiments with this design.

BROKER. The origin of the word is contested; some
derive it from the French broyer, "to grind;" others from
brocander, "to cavil or riggle;" others deduce broker from a
broker broken, and that from the Saxon broc, "misfortune;"
which is often the true reason of a man's breaking.
In which view, a broker is a broken trader, by misfortune; and
it is said that none but such were formerly admitted to that
employment.

Brokers are of several kinds; exchange-brokers, in-
urance-brokers, stock-brokers, and pawn-brokers.

Brokers, exchange, are a sort of negotiators, who con-
trive, make, and conclude bargains between merchants and
traders, in matters of money or merchandise, for which
they have a fee, or premium. See Exchange.

Thefe, in our old law-books, are called brokers, and in
Scotland, brocarr, i. e. according to Skene, mediators or
intercessors in any contract, &c. See Brozeneta.

They make it their business to know the alteration of the
course of exchange, to inform merchants how it goes, and
to notify to those who have money to receive or pay beyond
sea, who are proper persons for negotiating the exchange
with; and when the matter is accomplished, that is, when
the money is paid, they have for brokerage, two shillings per
100 pounds sterling.

Thefe, by the latitudes of S and W William III. 6 Ann. c.
16, are to be licensed in London by the lord-mayor and
aldermen, who administer an oath, and take bond for the
faithful execution of their office; and any person acting with-
out such a licence and admission, is liable to the forfeiture
of 50l. and persons employing them forfeit 50l. This is also
the cafe at Brifol, by flat. 3 Geo. II. c. 31. They are also to
regulate contracts, &c. under the like penalty; and not to deal
for themselves on pain of forfeiting 200l. They are like-
wise to carry about with them a silver medal, having the
king's arms, and the arms of the city, &c. and to pay 40s.
a year to the chamber of the city.

In France, till the middle of the seventeenth century,
their exchange brokers were called "courtiers de change;"
but by an act of council in 1639, the name was changed
for that more creditable one of "agent de change, banque,
et finance;" and in the beginning of the eighteenth cen-
tury, to render the office still more honourable, the title of
"king's counsellors" was added.

At Grand Cairo, and several places of the Levant, the
Arabs, who do the office of exchange brokers, are called
"consuls;" the manner of whose negotiating with the Euro-
pean merchants has something in it fo very particular, that
we have referred it to a distinct article.

The exchange-brokers at Amfterdam, called "makelaars," are
of two kinds; the one, like the English, called "worn
brokers," because of the oath they take before the burgo-
masters; but the owners negotiate without any commi-
nion, and are called "walking brokers."—The firft are in number
395; whereas of 375 are Chriftians, and 20 Jews: the others
are nearly double that number; so that in Amfterdam there
are nearly 1000 exchange brokers. — The difference between the two consists in this; that the books and persons of the former are allowed as evidence in the courts of justice; whereas, in cases of dispute, the latter are disallowed, and their bargains dishonoured.

The fee of the sworn exchange brokers of Amsterdam is fixed by two regulations, of 1613, and 1623, with regard to matters of exchange, to eighteen fols for 100 livres de gros, or 600 florins, i.e. three fols for 100 florins; payable, half by the drawer, and half by the person who pays the money. But custom has made considerable alterations therein.

The Jews, Armenians, and Banians, are the chief brokers throughout most parts of the Levant and the Indies. In Persia, all affairs are transacted by a sort of brokers whom they call "delil," i.e. "great talkers." The manner of making their contracts is very singular, and has been explained under the article Banians.

The French distinguish two kinds of brokers; one for the service of merchants, the other of manufacturers, artificers, and workmen. The business of the former is to facilitate the sale of goods in the wholesale and mercantile way; that of the other, to procure the goods wanted for manufacturers, artificers, &c. or to sell their goods when made. At Paris there is a company of tradesmen, or even mechanics, but have their brokers, who are usually taken out of their body, and make it their business to negotiate in the particular kinds of goods to which such company is by statutes restrained. There are brokers for drapery, brokers for grocery, brokers for mercery, &c. There are even brokers for tanners, curriers, cutlers, and the like. D.ict. of Comm.

Brokers, insurers, or policy, are agents who transact the business of insurance between the merchant or party injured and the underwriters or insurers. These insurers, brokers, from the nature of their employment, ought to be, and indeed generally are, persons of respectability and honour, in whom unlimited confidence may be reposed. To the broker the merchant looks for the regularity of the contract, and a proper selection of responsible underwriters: and to him, also, the underwriters look for a fair and candid disfavour of all material circumstances affecting the risk, and for the payment of their premiums. There is usually an open account between each broker, and every underwriter, with whom he has much dealing. In this account the broker makes himself debtor to the underwriter for all premiums, and takes credit for all losses to which the underwriter is liable, and which the broker is authorized to receive. Indeed, it is generally understood, that by the usage of trade in London, the underwriters give credit only to the broker for their premiums, and can retract only to him for payment; and that he alone, and not the underwriters, can recover the premiums from the insured. This point, however, has never been settled by any judicial determination. But though the underwriter thus looks to the broker for his premium, and though the broker in his account with the underwriter, takes credit for the losses and returns of premiums, which he is authorized to receive from the underwriter; yet, such losses are not to be regarded as a debt from the underwriter to the broker. In the case of the bankruptcy of a policy broker, the court of king's bench (23 Geo. III.) held, that though credit for the premiums must be given to the broker, because the underwriters know nothing of the principals; yet, that they could not set off the losses or returns of premium due to the principals, and which they only could sue for, against a debt due from the defendants to the bankrupt. In this case, the defendants had no commissary del credere. In a subsequent case, where the action was brought by the assignees of an underwriter against the factor, it was determined (26 Geo. III.) that the defendant might set off losses upon policies subscribed by the bankrupt, and due to the defendant's correspondents; but that the defendant had a commission del credere, which, lord Mansfield said, made him liable to his correspondents for losses, without first bringing an action on the policy against the underwriter.

Where the merchant happens to reside at a distance from the place where he means to be insured, the policy is usually effected by the mediation of his agent or correspondent there, who, if he be not a broker, employs one, and gives him all necessary instructions. In order to his being an agent in such a case, he must either have express directions from the principal to cause the insurance to be made, or else it must be a duty arising from the nature of his correspondence with the principal. And no general authority which he may have in relation to a ship or goods, will make him an agent for the purpose of insuring, or behalf of the parties interested. However, though one man cannot, in general, compel another against his consent to become an agent for procuring an insurance to be effected for him, there are three cases, in which an order toinsure must be complied with: as, 1st, where an agent has effects of his principal in his hands; 2ndly, where he has been in the practice of making insurances, and has given no notice to discontinue; and, thirdly, where he accepts bills of lading left him on condition to insure.

To the office of agent or broker, great responsibility attaches; and, in the execution of it, it is the duty of each to conduct himself with the greatest fidelity, punctuality, and circumference. For in this, as in all other cases, where a man, either by an express or implied undertaking, engages to do an act for another, he either wholly neglects to do it, or does it improperly or unskilfully, an action on the case will lie against him to recover a satisfaction for the loss or damage resulting from his negligence, or want of skill. Hence, if a merchant here accept an order from his correspondent abroad to cause an insurance to be made, but limits the broker to too small a premium, in consequence of which no insurance can be effected; he is liable to make good the loss to his correspondent; and, if he does not receive the insurance done at as low a premium as possible, yea, he has no right to limit the premium, as to prevent the insurance from being effected. And even a voluntary agent, who has no prospect of remuneration for his trouble, is liable, provided that he takes any step in the business.

It is not only the duty of the agent, in transacting the business of insurances, to conduct himself with fidelity and punctuality towards his employer, but he is also bound to observe the strictest veracity and candour towards the insurer: for any fraud or concealment on his part will avoid the policy, even though the injured be altogether ignorant and innocent respecting it.

In an action against an agent, or broker, whether for negligence or unskillfulness in effecting an insurance, the plaintiff is entitled to recover to the same amount as he might have recovered against the underwriters, if the policy had been properly effected. But he can only recover what, in point of law, he might have recovered on the policy; and not what the indulgence or liberality of the underwriters might probably have induced them to pay. In such an action, the agent may avail himself of every defence, such as fraud, deviation, non-compliance with warranties, &c. which the underwriters might have set up in an action on the policy; but if the agent act in the usual manner, it will be deemed sufficient.

There are many reasons why an agent or broker ought not to be an insurer. He becomes too much interested to settle with fairness the rate of premium, the amount of partial losses,
In an agent or broker, meaning to appropriate the premium to himself, and take the chance of a safe arrival, he is probably not, by underwriting the policy, to deprive the parties of his unbiased testimony, or other dispute.

In an agent or broker, meaning to appropriate the premium to himself, and take the chance of a safe arrival, he is probably not, by underwriting the policy, to deprive the parties of his unbiased testimony, or other dispute.

Brokers, or pawnbrokers, are those employed to buy and sell fences in the joint stock of a company or corporation; and also, in the public funds. The negotiations, &c. of these brokers, are regulated by the 5 Geo. i. cap. 18 and 7 and 12 Geo. iii. cap. 7, among other things, the nature of the transactions, in the nature of wages, &c. incur a penalty of 50cl. and by the sale of stock, of which the seller is not poissified, and which he does not transfer, a forfeit of 100cl.; and contracts for sale of any stock, of which the contractors are not actually poissified, or to which they are not entitled, are void, and the parties agreeing to sell, &c. incur a penalty of 50cl.; and that brokers keep a book, in which all contracts, with their dates, and the names of the parties concerned, shall be entered, on pain of 51l.: these enormities, however, are little regarded by the gamblers in the public funds. See Stock-jobbing.

Brokers of household furniture. See Appraisers.

Brokers, pawn, are persons who keep shops, and let out money to necessitous people upon pledges, for the most part on exorbitant interest. These are more properly called pawn-takers, or tally-men, sometimes fripers, or fripersers.

Of these is to be understood the statute of 1 Jac. i. c. 21, by which it is enacted, that the sale of goods, wrongfully gotten, to any broker in London, Westminster, Southwark, or within two miles of London, shall not alter the property thereof. If a broker, having received such goods, shall not, upon the request of the right owner, truly discover them, how and when he came by them, and to whom they are conveyed, he shall forfeit the double value thereof to the said owner.

But there are several excellent regulations respecting pawnbrokers of later date. By Stat. 25 Geo. iii. c. 48, pawnbrokers are annually to take out a licence on a 10l. stamp, within the bills of mortality, and 5l. in any other part of the kingdom, for each shop kept, under a penalty of 50l. By Stat. 29 Geo. iii. c. 57, confirmed by Stat. 31 Geo. iii. c. 52, and 33 Geo. iii. c. 53, pawnbrokers are allowed the following rates of profit for interest and warehouse-room. For every pledge upon which there has not been lent above 25. 6d. one halfpenny, for any time during which the said pledge shall remain in pawn, not exceeding one month, and the same for every month afterwards, including the current month in which such pledge shall be redeemed; for 50., one penny; for 75. 6d., one penny half-penny; for 10s., two-pence; for 12s. 6d., two pence half-penny; for 15s., three-pence; for 17s. 6d., three-pence half-penny; for 1l., four-pence; and so on progressively and in proportion for any sum not exceeding 45s. and for every sum exceeding 45s. and not exceeding 15l., at the rate of 3d. and no more for the loan of every 20s. of such money lent by the month; and so in proportion for any fractional sum. A party applying for the redemption of goods pawned, within seven days after the expiration of any month, may redeem them without paying any thing for the seven days; and applying after seven days, and within sixteen days, pays the profit for one month and the half of another month; but after the expiration of the first fourteen days, the pawnbroker may take for the whole month. He is required to make entries, and to give duplicates. Any person fraudulently pawnning the goods of another, and convicted before a justice, shall forfeit 20s. and the value of the goods pawned, &c. to be ascertained by the justice; and on failure of payment, be committed to the house of correction for not more than three months, nor less than one month, and be publicly whipped; the forfeitures being applied to the satisfaction of the injured party, and the defrauding of colls, and the overplus, if any, to the poor of the parish. Any person counterfeiting or altering a duplicate, may be seized and taken before a justice, who is to commit the offender to the house of correction for not more than three months, nor less than one. If a person shall offer to pawn any goods, refusing to give a satisfactory account of himself and the goods; or if there be reason to suspect that the goods are stolen; or if any person, not entitled, shall attempt to redeem goods pawned; they may be taken before a justice for examination; and if it appear that the goods were stolen or illegally obtained; or that the person attempting to redeem them has no title or pretence to the same, the justice is to commit him to be dealt with according to law, provided the nature of the offence shall authorize such commitment by any other law; or otherwise, for not more than three months, nor less than one. A justice may grant a search-warrant, and a peace-officer break open doors, and remove the goods, if found, to the owner. If pawnbrokers refuse to deliver up goods pledged within one year, on tender of the money lent and interest, a justice is empowered, on conviction, to commit them till the goods be delivered up, or a satisfactory satisfaction be obtained. Goods may be sold by public auction after the expiration of one year; being exposed to public view, and catalogues of them published, and twoadvertisements of sale by the pawnbroker to be inserted in some newspaper, two days at least before the first day's sale, under penalty of 5l. to the owner. Pawnbrokers, receiving notice from the owners of goods before the expiration of a year, are not allowed to dispose of them, till after the expiration of three months from the end of the said year. They are to enter an account of sales in their books of all goods pawned for upwards of 10s.; and the overplus, in case of sale, shall, upon demand within three years, be paid to the owner, necessary interest, costs, &c. being deducted: and refusal to pay the overplus shall incur a forfeiture of treble the sum lent, to be levied by distraint. Pawnbrokers shall not purchase goods in their curdly, or suffer them to be redeemed for that purpose; nor lend money to any person appearing to be under twelve years of age, or intoxicated, or purchase duplicates of other pawnbrokers, or buy any goods before eight in the forenoon, and after seven in the evening; nor receive any goods in pawn before eight in the forenoon, or after nine at night, between Michaelmas and Lady-day; and before seven in the forenoon, and after ten at night, during the remainder of the year, except the evenings of Saturday, and those preceding Good Friday and Christmas day; nor carry on the trade on any Sunday, Good Friday, or Christmas day. Pawnbrokers are to place in their shops, a table of rates allowed by this act; and they are required to have their Chrifitian and surname, and business, written over the door, under a penalty of 10l. half to the informer, and half to the poor. Pawnbrokers offending
ing against this act, in cases where no penalty is provided, shall for every offence forfeit 5l. leviable by distress, half to the informer, and half to the poor. Complaint shall, in all cases, be made within twelve months. This act does not extend to pledges for money above 10l., nor to persons lending money upon goods at 5 per cent. interest.

In the cities of Italy, there are companies established by authority for the letting out money in pawn, called "mounts of piety;"' an honourable title, like that of the charitable eperoration,' but little becoming such institutions; for, as much as the loan is not gratis. In some parts of Italy, they have likewise "mounts of piety" of another kind, wherein they only receive ready money, and return it again, with interest to be paid per annum. At Bologna, they have several high "mounts;" which are distinguished into frank and perpetual; the interest of the former is only four per cent. in the letter, even.

Gen. Char. Calyx triad, three-cornered, superior, permanent; segments three, ovate. Cor. either monopetalous with three deep divisions, or of three petals, narrow, lanceolate, erect, longer than the calyx. Nectar, adhering to each petal above the base, converging. Stema, filaments six, awl-shaped, shorter than the corolla, inserted into the receptaculum. Linum. Schreb., on the corolla or calycine glands. Bot., on calycine glands produced above the germ (chance in some degree glanduliferous) Joff. Authors erect, arrow-shaped. Pyl. germ inferior; style simple, thread-shaped, the length of the stamens; stigma obtuse, triad. Pericarp, a berry or capsule, one or three-celled. Seeds, somewhat oblong, obtuse. Eff. Char. Calyx trident, superior. Cor. with numerous secales at the base.

Species. 1. B. Ananias, pine-apple. (La Marck Ill. Pl. 225.) Leaves ciliate-fimbriate, sharp-pointed; spike 8vo. Linn. Root perennial, fibrous. Root-bases from two to three feet long, and from two to three inches broad, cambered, often a little glaucous. Stem short, cylinder, thin. Leaf. Spike glomerous: deit. fey, red or brown, crowned with a tuft of leaves. Flowers to four feet, and leaves, but smaller. This allies itself, male, and is scattered upon the calyx, thick, fiddle, receptacle. Green, half buried in the fulness of the receptacle, white, with the flowers fall off, increases in size, and becomes a mere. fruit, covered on all sides with thin, brown, rough, hard, and resembling the tulle of the grape. The common English name is derived. It is a native of South America, and is said to be found also in Africa and the East Indies. 2. B. Karatasia. Linn. Leaves cresc. long, narrow; flowers fiddle, aggregate, subrhombic. Stem perennial, fibrous, blackish. Leaves smooth, light-green, disposed in a kind of circle, and having a large open space in the middle. Flowers numerous, purple, or bluish, fiddle on the crown of the root, and forming a close, oblong, denser group. Calyx and germ covered with a furrugious down. Petal, fiddle-shaped. Pericarp, berry ovate, three-celled, very fleshy, succulent, of an agreeable, acridulous taste, when ripe. Seeds oblong. La Marck, from the MSS. of Plummer. A native of South America and the West Indies. 3. B. hemisphorica. La Marck. "Subcamptica; flowers fiddle, disposed in a close hemispherical group. Nearly allied to the preceding; but the leaves are more open and shorter; and the root, when the plant is in fructification, throws up a very short stem. La Marck supposes that the humilitas Linnanae is only a variety of the hemisphorica, of a smaller size, with fewer flowers, and less pleasant fruit. A native of Mexico.**

** Flowers upon distinct receptacles, with polypetalous corollas; the proper bronicles of Plummer.**

4. B. Pinguin. Linn. Leaves ciliate-fimbriate, sharp-pointed; raceme terminal. (La Marck Ill. Pl. 225.; Gurt. Pl. 11. fruit.) Resembling B. ananias in general habit. Root perennial. Leaves five or six feet long, according to Joaquin, more than those of B. ananias, green above, and covered with a whitish powder beneath; the inner ones red and shorter than the others. Stem cylindrical, thick, firm, two or three feet high, pubescent, surrounded by the red interior leaves. Stems pale red, or whitish, diminishing in size as they approach the summit of the stem. Flowers roset-coloured, fiddle, in the axils of the upper leaves, and forming a beautiful, pyramidal spike. Fruit about the size of a walnut, ovate-pyramidal, obtusely three-corned, threecelled, covered with a thick subfuscos fusco and rugulose, with confluent dots, and terminated by the permanent, trident stigma resembling a tuft of small leaves. The fruit is described by La Marck as a capsule, but is said by Brown (Jamaica) to have an agreeable sweet pulp, joined with such a sharpness, that, if suffered to continue in the mouth, it will cause the blood to ooze from the palate and gums. A native of the West Indies. Description chiefly from La Marck.

5. B. radiata. Linn. Radix leaves dentate-simplici; stem leaves very entire. Linn. Root perennial, paratactic, attaching itself to the trunks of large trees. Root-leaves two feet long, three inches broad, fiddle, convex, smooth, green, pointed, and edged with strong black spines. Stem cylindric, firm, thick, two or three feet high, covered with a short down, which generally gives it a whitish colour, though it is sometimes almost entirely red. Stem-leaves or leaves oblong, very entire, part red or purple, part whitish. Flowers roset, rote-coloured, fiddle, not accompanied by secales, whence
Bromelia.

whence its trivial name, and by which it is so clearly distinguished from the preceding, that it ought to form part of the specific character. *Bryoeis ovata*, of a bright red colour. Its leaves, like those of the European *dispatia*, or teak, retain the water from rain and dew, and afford a delicious draught to the hunter and traveller in its native forestage climate. Common in the woods of the West Indies, and fruit from the coast of Guinea to Mr. Miller. 6. G. *ferrugina*. La Mareck. *Radical leaves short and spinous; stem-leaves very long and very entire, without spines.* Burn. Amer. *Root-leaves lanceolate, sharp-pointed, frittered, covered beneath with a whitish powder, and a little enlarged at the base. Stem or Stems cylindrical, firm, about the thickness of the finger. Stem-leaves sword-shaped, pendent. Flowers of a beautiful red, in a clog pyramidal spike. *Bryoeis lanceolate. Corolla three-petalled; petals as inch and a half long, ending in a small purple point.* Native white, included in the corolla. Native of Martinique. 7. B. *fugacita.* Linn. *Leaves farrate-spinous, obtuse; spikes alternate.* Mill. *Root perennial, fibrous. Root-leaves, some almost lying on the ground, others upright, pale green, concave, many of them rolled up into the shape of a horn, and terminated by a short blunt point. Stem four feet high. Stem-leaves alternate, oblong, pointed, concave, without spines. Spikes, one terminal, the others in the axils of the leaves, or upper leaves of the stem. Flowers small, felifile. *Bryoeis round, with a small point, in simple racemes, of a bright coral red. Seeds small, oblong, reddish.* Native of the West Indies. 8. B. *bracteata.* Willd. *Leaves farrate-spinous; bracts ovate-lanceolate; leaf elongated; raceme compound; bractlets subdivided; flower felifile.* Swartz. *Root perennial, paraffical. Bryoeis scarlet, membranaceous, very entire.* 9. B. *paniculatana.* Willd. *Leaves farrate-spinous; bracts lanceolate; raceme compound; bractlets subdivided; flower pedunculated.* Swartz. *Scope more than a foot high. Bryoeis scarlet, alternate, membranaceous, half a foot long. Raceme two feet long, erect. Peduncles an inch long, tormentose.* 10. B. *Chrysantha.* Willd. *Leaves farrate-spinous; bracts lanceolate, toothed; raceme subcompound, shorter than the leaves; flowers pedunculated.* 11. B. *Aenangia.* Linn. *Panicle diffuse; leaves ciliate-spinous, sharp-pointed, recurved.* Native of Brazil. This species, which appeared in the first edition of the Species Plantarum, was omitted in the second, from a doubt whether it is specifically distinct from B. *Karatas*; but, on further consideration, it was replaced by Linnaeus himself in the Systema Naturae, and has been admitted by the subsequent editors of the Species Plantarum, but is not noticed by La Mareck.

Plumier, and the other older botanists, divided this genus into three; *Aenan*, *Karatas*, and *Bromelia*. The flowers of the *Aenan* are fifulae, are in a close spike, on a scape which is leafy at top; as the spike ripens, it takes the form of a fishy, scaly, fceleant fribole, composed of united berries, which are fearfully divided into cells, and frequently do not ripen their seeds. The *Karatas* have a dense radical corymbus, and ovate berries. The *Bromelias* are loosely spurred or panicked on a scape or stem; and the fruit can fearfully be called a berry. La Mareck, if he were not unwilling to increase the number of genera without absolute necessity, would be disposed to keep the *Aenan* and *Karatas* united, on account of their common receptacle and monopetalous corolla, and to separate the rest which have poly-petalous corollas on distinct receptacles. The *Karatas* have a dense radical corymbus, and ovate berries. The *Bromelias* are loosely spurred or panicked on a scape or stem; and the fruit can fearfully be called a berry. should remain till Michaelmas, and then be removed into the
flöve, and treated like the ananas. The penguin is culti-
vated in precisely the same manner. Neither of them will
produce their fruit in England, till they are three or four
years old. The latter being very spiny makes an impe-

cettrable hedge, and is much used in the West Indies for
fencing pasture lands.

The other species are cultivated only for curiosity, and
are raised from seeds brought from their native country, not
producing any in England.

Besides the varieties of the B. annua, or pine-apple,
above mentioned, there are others known to gardeners, and
sometimes introduced into cultivation.

The culture of the pine-apple is more difficult, and re-
quires a more exact and nice attention in its management, in
this climate, than that of almost any other plant. It is only
capable of being accomplished so as to afford good fruit, by
the assistance of the flöve of the hot-houfe, with the arti-
ficial aid of fire heat. And in order to effect the business
with the greatest care and convenience, and in the most perfect man-
ner, besides the flöve of the hot or fruiting-houfe, others are
necessary for the purpose of bringing the plants forward in,
till ready to set out in the fruiting-flöve, which are trimmed nursery-flöves, or pits of successive flöves. And
where large quantities of such plants are cultivated, it is al-
so useful to have what are termed bark-pits, formed either by
deep frames of wood or of brick work six feet in width, with
sufficient length, five or six feet deep behind, and four and a
half in front, having the tops glazed; for the purpose of
making hot-beds in, for the immediate reception of the
crowns and suckers from the parent plants, and to prevent the
succession-flöve from being crowded too much. Where
the whole culture of these plants is to be effected in one flöve
only, the plants must be raised and rooted together, by
which practice not one half of the same hot-houfe can be
occupied at one time with fruiting plants; besides, the young
plants are often liable to be brought forward too rapidly.
All these different flöves and nurving pits should be provided
with proper tires and fire-places, so contrived as to work
readily and save fuel as much as possible, as upon this the
expense of the culture of these plants in a great measure de-
pends. See Hot-house Stove and Bark Pits.

It is remarked by Mr. Nicol, that flöves for this use
are variously constructed: Some are single pitted, some
double, and some even triple; some have flues running un-
der, and some round the bark-bed. These he considers as
being very dangerous to the roots of the plants, if overheated.
He also disapproves of double and triple flöves, as being
very uneafy to work in stormy weather, and confusing a vast
quantity of stagnant unwbaleable air in dull hazy weather.
A flöve which there is a perfect command of fire-
heat, and which admits a free circulation of air in all
parts, is to be preferred, and none are so convenient for this
purpose as single ones. The situations for them should be
dry, and the bottoms or floors raised above the surface of
the ground. The common practice of having borders for
vines to be trained up the rafters, Mr. Nicol considers as
highly prejudicial to the pine plants.

Preparation of the bark beds.—The circumstance of im-
portance in the culture of these plants, is that of forming the
beds in the flöves and flats. These are differently constituted
with different cultivators, and are designed for the pur-
pose of plunging the pots into, with the plants in them,
in order to their due growth, and support. These beds are
mostly composed of tanners' bark, as being a substance that
not only affords the most uniform and durable heat, but which
is best suited to the nourishment and growth of the plants
and fruit, as well as the most manageable. See Bark bed.

The great art in making of these beds, is that of producing
such an uniform moderate bottom heat as may not injure the
roots of the plants, while it is sufficient to promote their
regular growth. The author of the "Scotch Forcing Gar-

den" observes, that his idea of the quantity and quality
of bottom heat that is required by the pine, is different
from that generally entertained. He never wishes the
plants, except in flirking suckers, to stand in a bottom heat
higher than that of blood heat, and that too of a mild moist
nature. If the watch fiaks to the depth of the bottom of
the pot feels just a little warm to the hand, or when ap-
plied to the cheek, when the body is of a comfortable tem-
perature, it is sufficient; and he thinks it sufficient with
reason, that the bottom and superficial heat should corre-
pond at all times. In order more effectually to attain this
end, and that the roots may sustain no injury, he has re-
course to the following rules in forming, turning, and tre-
chering the beds. He never fits the tan in the pit, or adds
above an eighth part of new, which, if necessary, he gives
place to by skimming off a little of the surface of the old.
The new tan is never suffered to lie within a foot of the
surface, by which means the pots are instantly plunged
in the old. He lays the half of whatever quantity of new
tan is added in the bottom of the trench, and divides the
other equally to within a foot of the surface of the beds.
In trenching he throws the tides to the middle, and the
middle to the edges, that there may be an equal mixture of
the old tan. Thus the beds are rendered of a mild and
equal temperature from the first, and continue much the
same for three or four months, and after the first filling they
are attended with very little expense for new tan. It is ob-
vious, therefore, that, in filling the pit of a new pinery, it
should either be done several months before the plants are
placed in, or the tan should be well sweated and wafted,
by previous turning in an open shed, &c. And in other cafes,
it is advisable not to plunge the pots above half their depth
for the first two or three months after filling. In adding
new tan, it should invariably be thrown up in a heap for
eight or ten days before using, in order to dry and sweeten,
and should never be applied fresh from the tan yard, as it is wet
and apt to heat violently, as well as cause in the beds. It is
remarked, that some object to tan, as being expensively and
troublesome in working with; but if this method is practised,
these inconveniences will be inconsiderable; and as the plants
require frequent shifting, the trouble of whipping up the bark-beds
at such times is but trifling; the addition of new tan being
sometimes unnecessary. He is convinced that there is no
ingredient which can be substituted for tan, that will equally
answer the purpose in the pinery, and of course recommends the
use of it in preference to all others, where it can be
easily procured; and more or less of it is always necessary.
He considers oak leaves as the next best material, but they
cannot be had in many places. Where they are used, he
advises that at least eighteen inches of well reduced tan
be laid on the surface to plunge the pots in; after these,
a mixture of stable dung and tree leaves of any kind. But
they should be well fermented before they are used, and at
least two feet of reduced tan laid on the surface for the recep-
tion of the plants. It is supposed by some, that the rea-
son of pines being planted in pots instead of the surface of
the beds, is the want of permanent heat in them, as they
may be removed with more facility in the time of renewing
the bark, &c.; but Mr. Nicol has a different opinion of the
matter, so that, if the heat of the beds were ever so perma-
nent, he would grow them in pots. As all the different
plants of any kind do not grow alike in their native climates, much
lefs the pine in an artificial one, there is a necessity for hav-
ing, at least, two compartments, and growing the plants in
pots,
posts, that they may be removed, and filled according to circumstances, with the greater care and safety. Besides, many of them, if placed in any situation, do much better in pots than elsewhere; for there are all of the succulent kind, with which the piece is the pure. There would also seem another reason, which is the last: ancient nature of tan and provide a proper medium for the growth and support of the young plant.

The usual period of forcing and growing or rearing the plants is from the middle of the autumn, as September or October, a little before winter, that the heat may be kept up, the ground, and the spring, as at the latter part of April, by throwing up being given in the internal leaves, and the result of the plant is laid down with a heap, throwing on a very little earth over them, to prevent their blowing away. They should remain in this state during the winter, and till the beginning of May, when they should be turned over and mixed well together. In this way, the spring following, they will be reduced into a mould proper for life. This mould, however, must be fitted before it is employed, in order to remove pieces of thick or other improper matters. A compost of turfy vegetable mould with rich garden soil and well rotten stable dung from a hot-bed, in the proportion of one-third of the latter, which have remained together for a considerable time, is likewise recommended by some. Brown, strong, heavy earth, when reduced by long exposure to the air, is another useful material; and pigeons' dung, that has been at half two years in an heap, and frequently turned and exposed to the influence of the weather, may be employed. Also full marl, and ca or river gravel, which has been lifted and kept in a dry place, having the size of large pebbles, &c. may sometimes be employed. The proportion in which they are advised to be made of for different purposes in the culture of these plants by Mr. Nicol, is this: For crowns and suckers entire vegetable mould, with a little gravel at bottom, to strike in; afterwards three-fourths vegetable mould, and one-fourth loam, mixed with about a twentieth part of gravel, and a little entire gravel at bottom, till a year old. For year old plants, till thinned into fruiting pots, one half vegetable mould, one half loam, to which add about a twentieth part of gravel, and as much full marl with a little gravel at bottom, as above. For suckers, one half loam, a fourth vegetable mould, a fourth pigeons' dung, to which add gravel and marl, as above, and lay two inches of entire gravel at bottom."

**Raising the Plants.** — This is the next point of material consequence in the cultivation of these plants, and which is effected either by the crowns produced on the tops of the fruit, the offsets, or suckers from between the leaves, and the roots of the old plant. The latter should never be employed when it can be avoided; of the other two, suckers are preferred by some, while crowns have the advantage, according to others; but Mr. Nicol judiciously remarks, that if the former have the superiority in being the stronger plants, they have likewise the disadvantage of running to fruit more uniformly than the latter. The crowns are procured by twisting them off the fruit when it is made use of, and the suckers by breaking down the leaf immediately beneath them, and moving them gently both ways till they come off, which should not be attempted till the under parts appear of a brownish colour, and ripe, as under other circumstances they are liable to break in the middle and be spoiled. When taken off, they should each of them be cleared of a few of the lower outward leaves about the bottom where they are to form roots, by rubbing them off; some also pare the under parts of the flumps, smooth with a knife. They are then laid or hung upon a dry place for five or six days, or more, that the over moisture and wounds of the flumps, or thick parts of the plants, may be dried up and sufficiently healed over before they are planted, and the danger of their rotting be prevented. The author of the "Scotch Forcing Gardener," however observes, "that if they are perfectly ripe, and the old plants have had no water for a week or two before they were taken off (which they ought not), nothing of this kind is necessary." Each plant frequently affords many suckers, but rarely more than one crown. The crowns are usually gathered one by one as the fruit is used, and stuck into a brick-bed till the whole crop of them, as well as the suckers, can be potted together. The plants, after being thus prepared and collected, must be placed, according to their sizes, finely in pots three or four inches in diameter, and five or six deep, provided for the purpose, and filled with entire vegetable mould, as directed above, having the bottoms previously laid with clean gravel, of the size of horse beans, to the thickness of an inch or something more: some, however, only advise pieces of slate or tile to be put over the holes in the pots. The first is probably the best method, as preventing the water most effectually from flagrant about the roots of the plants.

In planting they should be put neither too shallow nor too great a depth, but have the mould pretty closely pressed round them.

The nurseries should be prepared for their reception by having new tan to the extent of a fifth or sixth part added, but none suffered to be within ten or twelve inches of the surface. In these beds, where there is a due heat, the pots should be plunged up to their brims, in regular order, at the distance of two or three inches apart, each way, keeping them perfectly level, and the largest towards the back parts. Some advise a light watering to be immediately given, but others think that neither the crowns nor suckers should have any for the first fortnight after planting, nor any ever-head the till winter, lest they should be injured in their hearts by the damp which it occasions.

As the plants thus raised only produce fruit in the second, or more generally, in the third year's growth, commonly with suckers and crowns for future increase, and become afterwards of no use but as blocks for supplying a few more suckers, there is obviously a necessity for raising fresh supplies of plants annually.

**Culture in the nursery.** — The management of the plants the first year, or while they remain in the nursery-boxes and pots, requires much attention to keep them in a regular and healthy growth by preferring a continued proper degree of heat in the beds, and a judicious application of water with a suitable admixture of free air. Mr. Nicol observes, that where the plants have been struck in the beginning of September, the beds will most likely continue of a kindly heat till about the beginning of November, but should then be wrought over, introducing about an eighth part of new tan by trenching it in. But though the plants will in general have made good roots by this period, they do not in common
common land in need of being fresh potted; such only as are in any degree matted being put into other pots of the next size to those in which they are growing. The matted part being simply taken off, they should be replaced with the bulb as entire as possible. They are then to be plunged in the beds, as in the former case, quite up to the brims of the pots, and should remain till the beginning of April; at which period the beds should be again wrought over, as directed above, and the plants have the mould wholly shaken from the roots, after which they should be replaced in the same pots with fresh mould, and replanted in the beds. In this case the roots being fresh should never be disturbed, the parts that are decayed in the flumps or other places being merely removed.

As the heat of the beds, without the aid of fire, will not be sufficient during these periods for the healthy growth of these plants, it will be requisite to have recourse to that of artificial kinds. This should be applied about the beginning of October, or the following month, according to the date of the season. In the application of this heat great care should be had to keep it so moderate as not to force the plants forwards too much, and render them in danger of fruiting unseasonably, while it is sufficient for their perfect growth. The former is shown by their drawing up with long leaves and white hearts; and the latter, by the want of the proper healthy aspect. To accomplish this in the most certain manner, Mr. Nicol recommends working the flowers so as to keep the thermometer as near as possible to 65°, at seven or eight o’clock in the morning and nine at night, until about the first of March, and then to increase it gradually to 70°, at which it should be maintained so long as artificial heat may be required. When the weather is very severe, it is likewise necessary to cover and defend the glusses in the night time, as well as occasionally in the day, with canvas for the purpose, cloths fixed with rollers and pulleys, or large garden mats. At the above period the plants usually begin to grow in a vigorous and rapid manner, and require potting again about the first or middle of May, at which time the bed should be filled up to about half its depth, and, if necessary, a very little new tan worked in. The plants should be put into pots about six inches in diameter on the inside in the tops on a medium according to their sizes, with the balls entire; and if any of them are matted, that part should be displaced, plunging them to the brims at the distance of about fifteen inches from centre to centre of the plants in the largest kind, and a foot in the smaller kinds, giving a slight watering at the time. Another potting becomes necessary about the beginning of August; and where there are three compartments, the plants should now be removed into the succesion house, the bark-beds being worked over to the bottom. The plants should be put into pots of eight inches diameter, plunging them to the brims at the distance of sixteen inches on a medium, and setting them with a gentle watering. At these periods a more free admission of fresh air becomes necessary, especially when the weather is mild and favourable. Where other houses or succession-flowers are employed in the culture of these plants, they may at this time be removed into them, in order to be more conveniently managed in their growth the second year.

Culture in the Succession Storey or Pits. In the second year’s growth it will be necessary, towards the middle of November, to work the bark beds over to half during the winter; but the plants need not be shifted, the decayed leaves about their bottoms being only twilled off, and a little fresh mould laid on the surface of the pots, where it may be requisite, replunging the pots to the brims as before. Some advise the leaves of the plants to be tied up while they are potting or removing them, in order to keep them from being bruised; but the writer just mentioned disapproves of the practice, as he finds they are generally much more bruised in tying than when left loose. The method which he follows, is to have a perforfion standing opposite to him in the time of potting, which is performed on a flag about a yard high, which business is to hold up the leaves in a loose, though regular manner, between the arms, and prepare and band the pots. In this manner he has often been able to shift an hundred one-year plants in two hours. In conveying the plants through the doors of the flumes, the person should proceed with the back foremost, by which means the leaves are saved from injury, as the pot goes first, and the leaves are drawn back afterwards.

About the beginning of March the plants again require shifting, and the bark beds should then be trampled over as before. The plants at this time must be shaken out, and replaced in the same pots, in new mould, cutting off any of the decayed roots, or the ends of the flumps, twitting off a few of the bottom leaves, plunging them as before in the beds, and giving them a slight watering. Towards the first of June, the plants should again be shifted. The bark beds being wrought over to about half their depth, and a little fresh tan added when necessary, the plants, with their balls entire, should then be placed in pots of about ten inches diameter, plunging them, at the distance of eighteen inches from centre to centre, into the beds, and settling them with a little water.

In regard to potting, it is remarked by the same author, that at all times a few of the bottom leaves should be twilled off each plant, that fresh roots may be made more readily off the surface, which tends to keep them more ready in the pots. The fire heat in these cases should be begun about the same period as before, according to Mr. Nicol, and kept to about 60 degrees of the thermometer till the beginning of March, and then gradually increased to 65° for the remainder of the season. The plants should be refreshed occasionally with a little water, according as the earth in the pots becomes dry, or as the climate of the weather demands. They should likewise have a more free admission of fresh air, whenever the season will admit of it without danger.

Culture in the fruiting-floor or hot-house. The plants raised in the nursery pots, and continued in their growth in the succession flowers, having attained a proper size and length, should, towards the latter end of August, or the beginning of the following month, be placed in the pots in which they are to fruit, in the same manner as before, and placed in the flowers of the hot-house, which should have the bark beds prepared for their reception, by trenching them over to the bottoms, and adding a foot of new tan in a proper state of preparation for the purpose, being well blended, and made so as to fill up the pots well. The pots in which the plants are now put, should be about a foot in diameter, and should be plunged in the beds to the brims, a gentle watering being immediately given. In potting the plants Mr. Nicol in these cases advises the use of a small stick to trundle the mould down between the balls and the sides of the pot, so as to leave no cavities, a circumstance which should be attended to, as being of great utility. The management in this state differs but little from that of the preceding; the chief circumstance to be regarded, is that of keeping up the heat in as regular a manner as possible, with the addition of a due quantity of refreshing moisture, and free air. The beds should, about the middle of November, be twilled up to half their depth, and a little tan added; but the plants must not be shifted at this period, only
only requiring to be replunged to the brims again in the beds for the winter. It is the common practice at this time to add a large quantity of new tan, in order to keep up a strong bottom heat through this season; than which Mr. Nicol thinks nothing can be more erroneous. He has already remarked, that the bottom and superficial heat ought to correspond at all times; and if the house is to be wrought at 60° only for the winter, it follows, he supposes, that a very moderate bottom heat is sufficient. The temperature of the house being so much reduced in winter, is, he concludes, to prevent the plants from starting too soon into fruit; and their doing so is frequently more in consequence of too much bottom heat, than irregularity in the temperature of the house. In the beginning of February, which is the best flowering season, the bark beds will require trenching, which is the only time of the year that the above author advises a deviation from the rules given above. From this time the house, in his opinion, should be wrought as high as 70°, and the bottom heat keep pace with the artificial, for which new tan, to the extent of a sixch part, should be added. Such of the plants, he observes, as, are not flown, are healthy at the root, and Fraud erect and firm in the pots, should have a little fresh mould laid on the surface of the soil; and the removal of about two inches of the old. But those that are already flown, and those that are anywise unhealthy, or appear flunted, should be shaken out entirely, and replanted with fresh mould in the same pots; but none of the pots, unless waited, should be cut away, or removed. This, so far as it refpects the plants that are flown, he presumes have not been hitherto recommended; he is accordingly happy in being enabled to do it with confidence, as it has ever been a matter to be regretted, that pines, from the want of sun and air in the winter months, are apt to be flunted, and flew their fruit too early, and that fruit so flown, seldom comes to any considerable size or flavour; the plants so flunted, being unable to nourish the fruit, and, from the want of sunshine in the early months, coming far short in flavour of that matured at a later period. It is added, that the experiment was tried on a dozen of plants, the half of which were in, and the other half past, the flower at this time of the year; the result was, that they were kept back a full month by the operation; those that were past the flower equalled, and those that were only in flower exceeded any of the others of their own forwardness at the time of shifting. Being encouraged by this success, he treated his whole stock of flowering plants in the same manner in the following seasons, and they were kept back to a better season, and swelled their fruit to as good a size as those that showed in February. Towards the beginning or middle of May, the bark beds should be again trenched to the bottom, a tenth part of new tan added, and the plants replunged in the beds in the same manner as in the preceding cafes, nothing further being necessary. Though it is not possible to apply the heat constantly with that degree of exactness that has been recommended, it is of great importance to approach it as near as can be conveniently done, which, by proper attention to the thermometers employed for the purpose, may in a great degree be accomplished, especially where the person who manages the fires, has likewise the command of the house, which should always be the case.

Several sorts of fuel are employed, but coal or cinders make the most regular and durable fires, where they can be obtained. Ground tan heat may also be employed where the fire-places are properly contructed for the purpose. See Hot-house.

With regard to the admition of air, the author of "The Scotch Forcing Gardener" recommends very large portions in the fruiting house whilst the fruit is ripening, as it is, he thinks, not only essential to the flavouring of it, but highly conducive to the ripening and hardening of the suckers, which is also a point of importance. Though it is the practice of some to shade their plants from the sun, the above author supposes they can never have too much of its influence. It is advised, that if a winter even fruit should be admitted at a moderate degree at the top of the house, and in fresh weather, at this season, to the extent, that the thermometer may not be more than 5° above the fire-heat medium, being continued till the middle of March; after which, and for the whole season, not more than 10°. It is observed that winter fires are frequently made in the morning, solely for the purpose of admitting air, and at the same time for raising up the temperature of the house, and that although the pine, from its nature, does not appear to quickly feel the effects of bad management, there are few plants in reality do it more so, and too due an attention to the temperature of the house, especially in winter, cannot be paid, the want of which is sure to throw the plants into fruit in an untimely season.

In respect to the application of water in the culture of these plants, it is advised to be given very sparingly in dull weather, particularly in the winter season, from the beginning of October to the first or middle of March, once in eight or ten days is generally sufficient, in a small proportion; but from that period plentiful waterings are requisite, in considerable quantities at a time, mostly once in three or four days. Watering much over head in winter, except in clear weather, is not advised; but in the summer months it is recommended, as a good practice, to first give the quantity requisite to the root from the spout of a watering pan, and then a sufficient quantity to wet every part of the leaves from the rote; the reason of which is, that the different kinds of pines are formed to require very different quantities of water: the queen requiring more than the king; the Antigua, or brown sugar loaf, and the Montferrat and green or filipot sugar loaf, a medium between the two, in plants of an equal state of health and size.

With the fruiting plants, very large quantities are required from the time they are out of flower, till they begin to colour; but which should then be gradually withheld, and towards its maturity totally, as this increaseth the flavour of the fruit, and perfects the ripening of the suckers.

Steaming is considered as not only useful to the health of the pine, but, in dull hazy weather, prejudicial; of course, when there are grapes in the hot-house, it should be regulated so as to suit them.

Water well impregnated with air should be used at all times, which should be applied about eight in the morning, and from four to five in the afternoon. In the watering of these plants, a tin pipe is recommended as useful and convenient, for the more ready conducting the water in the quantity intended to any particular plants of the bark beds. It should be six feet long, an inch and half in diameter at the upper end, and at the other about half an inch, and be formed of two or three separate pieces to lengthen or shorten at pleasure. At the longest end a kind of funnel should either be fixed, or fo contrived as to take off and on occasionally, to receive the water from the watering pot. By this means water is capable of being conveyed to the plants separately, in any proportion, to the hearts of them, without wetting the bark beds more than is necessary to maintain the earth in the pots, &c. It is particularly applicable in winter as well as in the spring, during the bloom of the fruiting plants. In winter it may sometimes be proper to have some conveniences in the hove to preserve water in, that
that it may be raised in its heat a little previous to watering the plants with it.

Some have attempted the culture of the pine-apple without the aid of hot-houses, or boxes constricted for the purpose, simply by common deep garden frames, and dung hot-beds, aided by occasional linings, in order to promote and keep up a regular degree of heat; but this is a very imperfect method, and seldom attended with much success.

The injuries to which these plants are chiefly exposed during their growth, are brown and white scaly insects, of the cocoon tribe, and the ant. But as the last is seldom seen, if the former be not present, Mr. Nicoll concludes that their presence is in consequence of that of the insects on which they feed to seem to be. And the brown scaly insect is conceived to be no further injurious, than by discolouring the plants; but the white scaled, or bug, is of the most injurious nature to the plants, as, where it abounds, they never succeed well. In order to remove them, Mr. Nicoll found the following method answer perfectly, in a case where the plants were greatly affected. Having prepared a strong heat for the plants in the dark bed of the nursery pits, he shook out and cut away all fibre from their roots, whereby they were rendered the same as if on the first, not excepting those that were in fruit, some of which were just in flower, dipped them into a liquor prepared by boiling two pounds of foil soap and flower of sulphur, with one pound of roll tobacco, and two ounces of nux vomica, in eight gallons of water to fix; put them into pots of six inches diameter, and plunged them to the brims; kept up a fire heat to about 75°, gave them but little air, shading them in fun-shine, and afterwards gave them plentiful waterings over head with the same mixture, reduced to about half its former strength. He continued this treatment for two whole months; at the end of which he again shook out their roots, and washed the whole plants in pure water, put them into fresh pots of eight inches diameter, and re-plunged them into a kindly heat in another nursery pit, treating them in all respects as any other plants. He never saw a vestige of the bug afterwards; a few of those plants that were shewn, however, died, but the others, he observed, produced such fruit as might be expected from plants of such sizes of any other kind.

Time of Maturation, and cutting of the Fruit. The common season for the ripening of this sort of fruit is from June till September; but from August to the end of the latter month is the principal period of their attaining to the greatest perfection. Mr. Nicol remarks, that some kinds put forth suckers at the base of the fruit, which should be rubbed off as they appear; others put forth suckers from the root; and as these are not proper to be taken into the flock, they should also be twisted off, or otherwise destroyed, as they appear. It is added, that if a plant were to be divested of all its suckers, the fruit would open to a much larger size in consequence; but as this was ultimately tend to the extirpation of the whole flock, it is by no means advisable. It is proper, however, to reduce the number of suckers on the plant to two or three at most, which should be done in the May planting; and as the suckers are about half grown at the time, the cultivator is enabled to choose the best, and at the same time to easily destroy the others, by breaking out their hearts. Where the increase of the flock is the object, all suckers, even at the root, should be encouraged in their growth. As some of the kinds also grow long footstalks, which are apt to bend down as the fruit gets heavy, they should be supported by small stakes, or other means, as when the fruit falls over the stalk, it is liable to be bruised, and the nourishment of the fruit retarded.

This sort of fruit loses much of its flavour, when suffered to grow till fully ripe; where not prevented, it should therefore always be cut by the time it has attained a greenish yellow colour, and either left in the heart of the old plants, or hid on the wall-plate, &c. in the flower for a few days, after it has been separated from the stem.

The sign of the fruit having attained perfection in most kinds, is that of affuming a fine golden colour, with a delightfully fragrant smell; at which time it should always be removed. The method of performing which, is by having several niches of the stems with it, and also the crown of leaves at the top. It is eaten in the highest perfection soon after being cut; but when required, it may be preferred for several weeks, by putting the fruit into a bottle of pure water, renewed every two or three days, and placed in a well-dried room of above 60° of heat.

The cultivation of the other species may be performed either by sowing the seeds obtained from abroad, in the autumn or spring months, in pots plunged in the hot-beds of the flowe, or by means of suckers, in the manner of the pine-apple plants. They must be kept constantly in the flowe, where they afford much variety, when properly managed, at all assemblage with other plants of the same sort.

BROMFIELD, William, in Biography, who, in a long course of practice, attained to the highest degree of reputation in his profession, was born in London, in the year 1712, and was initiated in the practice of surgery, under Mr., afterwards sergeant, Ranby. With such a precocious, and with a mind susceptible of information, he early found himself capable of practising on his own account. In the year 1741 he began to give lectures in anatomy and surgery, and soon found his theatre crowded with pupils. Two or three years after, in conjunction with the renowned Mr. Madan, he formed the plan of the London hospital, for the sole reception of that unfortunate class of patients, who are affected with the venereal disease. By a strong and forcible appeal to the humanity of the public, and by showing the advantages that ultimately might redound to them, from the improvements that might be expected to be made, in such an asylum, in the method of treating that frightful disease; a subscription was raised sufficient to enable the projectors of it to erect the present spacious and handsome building, but not for its maintenance, which is still effected by voluntary contributions. To this hospital Mr. Bromfield was made surgeon, an office he filled with advantage to the patients and credit to himself for many years. With a view of contributing to its success, he altered an old comedy, "The City Match," written in 1659, by Japser Maike, and procured it to be acted at Drury-lane theatre, in the year 1755, for the benefit of the hospital. He was also, very early after its being intituled, elected one of the surgeons to St. George's hospital. In the year 1761, he was appointed in the suit of the noble person, who were sent to bring over the princes of Mecklenburgh, our present queen, and was soon after appointed surgeon to her majesty's household. In the year 1751, he went to the Royal Society a lecture of a woman who had a factus in her abdomen nine years, which is printed in their transactions for the same year. In 1757, he published an account of the English night shades, the internal use of which had been recommended in ferephorous cases; but they had failed in producing the expected benefit with him. Under their use, the ulcers became worse; they occasioned thirst, dimness of sight, and, if not cautiously given, death. In 1759, he gave "A Narrative of a Physical Transaction with Mr. Aylet, Surgeon, at Windfor." This is a controversial piece, and the author clears himself from the imputation of having treated his antagonist improperly. In 1767, he published, "Thoughts concerning

BROMLEY, a township in the county of Kent, England. The town contains 4,744 houses, and 27,700 inhabitants. Wilmot's History of Bromley, 12mo.

BROMLEY, or ABBOTS-BROMLEY, a small market town of Staffordshire, in England. The adjunct abbots was given to it in consequence of its abbey, which is now entirely dissolved. This town contains one street, near the centre of which is the town hall, where the court-leet and court-baron of the earl of Ukberide are annually held. Bromley stands in a fine open fertile country, distant 19 miles N.W. from London, and 11 from the city of Lichfield. Here is a weekly market on Tuesdays, and three annual fairs. The town contains 2,223 houses, and 8,059 inhabitants.

Near Bromley is Blithfield, the seat of lord Bagot; and at two miles distance is Howacroft, the seat of the earl of Shrewsbury. The forest of Needwood, considered the greatest ornament of Staffordshire, is 3 miles from this place.

BROMPTON. Sec CHATHAM.

BROMSBRORO, a town of Sweden, in the province of Smaland, which has a large bridge over the river that here discharges itself into the sea. A small island lies in the middle of the river, on which two stones are erected for boundaries. This place is famous for a congress, held in 1541, and again in 1572, for settling some disputes concerning the arms of the three northern crowns; and also, for a treaty of peace, concluded in 1657, between Sweden and Denmark. It is 4 leagues from Christianopole.

BROMSGROVE, a town of Worcestershire, in England, is noted for its manufactures of worried, linen cloths, fish-hooks, needles, nails, &c. It had formerly a manufactory for broad and narrow cloths, but this is removed into Gloucestershire. In the reign of Edward I. Bromsgrove sent two members to parliament, and it has had many privileges conferred on it by different monarchs. Edward VI. founded a grammar school here, which was additionally endowed by sir Thomas Cooks. The church and town are large and handsome, and the former, from its high situation, is approached by a flight of fifty steps. It is ornamented with some painted glass, and contains several fine monuments. Among these is one for judge Lyttleton, 1600; bishop Hall, of Bristol, 1710; sir Humphrey Stafford, who was killed in Cade's rebellion; sir John Talbot, of Grafton; and another ascribed to a daughter of Henry VII. This parish contains twelve mansions, and its houses amounted, in 1821, to 1,158, and its inhabitants to 5,968, of which 12,28 were engaged in manufactures and trade. Bromsgrove is 115 miles N. W. from London, and 12 from the city of Worcester.

About one mile and a half distant is Grafton manor, the ancient seat of the earl of Shrewsbury. Hewell-Grange, the seat of the earl of Plymouth, is at 4 miles distance. Dodford priory is within two miles of Bromsgrove. Nash's History of Worcestershire.

BROMUS, in Botany. (Bromus, food.) Linn. 89. Reich. 95. Schreb. 120. Juss. 32. Wild. 140. La Mare, Illust. 119. pl. 46. Smith Flott. Brit. 38. Clas. triandria digynia. Nat. Ord. gramina, graltis.

Gen. Char. Cal. glume, many-flowered, two-valved, spreading, collecting the florets into an oblong two-rowed spikes; valves ovate-oblong, acuminate, awnless; the lower one smallest. Cor. two-valved; the outer valve the fice and form of the calyx, concave, obtuse, blunt, putting out a
Its glumes are closely imbricated, ovate, acute, rather timid. Panicles, from seven to ten, widely inrolled, ovate, smooth, and depressed. Calyx of two unequal glumes, scarious at their edges, keeled, villous, marked with seven or nine strong green ribs.

The genus Bromus is entirely artificial, and there are no natural boundaries between it and fescue that have been hitherto ascertained. It was originally assumed by Linnaeus, that a terminal straw awn should determine a plant to be a fescue; but in practice this distinction has not been broadly observed, and great confusion has accordingly arisen in the distribution of species. Dr. Smith’s new character will prove a happy one, if it shall be found to prevail in all the foreign species, which have the general habit of Bromus; but we fear it will sometimes fail. It is already sufficiently evident, that the position of the dorsal awn, and the fringe of the glume, cannot both be admitted into the essential character of the genus.

Sp. 1. B. secalinus, Linna. (Eng. Bot. pl. 1171. Knap. p. 79.) Polyalthus, Scorpius, Hudson, Withering. “Panicle spreading; peduncles nearly simple; spikelets ovate, compressed, ten-flowered, florets distinct, roundish.” Dr. Smith. Smooth rye brome-gras. Root, annual. Stem about three feet high, simple, round, smooth, and leafy. Leaves, broadish, flat, ribbed, rough at the edge and underneath, clothed above with short, soft hairs; sheaths furrowed but not rough. Spikelets, very short. Panicles, when young, erect, with lanceolate, cloved spikelets; when mature, pendant, with the spikelets so expanded that the rachis is visible between them. Calyxes unequal, awnless; glumes elliptic, smooth, three-nerved, membranaceous at the edges. Florets, roundish, smooth, rarely downy, ovate, flat; outer glume marked with seven short ribs, with a rough and rather short awn; inner glume toothed rather than fringed. Dr. Smith. Knap. Native of England, in Norfolk frequent. 2. B. multiflorus, Weigel. Gmelin. Wild. (Knap. Tab. 80.) Considered by Linnaeus, a variety of secalinus. “Panicle spreading; peduncles seldom with more than one spikelet; spikelets, ovate-lanceolate, compressed, five-flowered; florets subimbricate, roundish.” Dr. Smith. Root, annual. Stem, smooth. Lower leaves, naked beneath, a little hairy at the edges above. Upper leaves, pubescent, with a short wooliness beneath, hairy above; all rough at the edge; sheath smooth. Spikelets, very short, lacerated, scarcely hairy. Panicles, as in the former. Spikelets, ovate-lanceolate, rather compressed, imbricate, and finally rather remote. Glumes generally slightly pubescent, rarely smooth. Dr. Smith. 3. B. mollis, Linna. Said by La Marck, in Eyce, Meth. to be only a variety of secalinus, but the error is corrected in the Illust. (Curtis 8. Eng. Bot. 1878. Knap. 77.) “Panicle erect, clove, compound. Spikelets, ovate. Florets, imbricated, depressed, ribbed, downy.” Dr. Smith. Root, annual, of a few simple fibres. Stem, erect, about two feet high, simple, fringed, generally smooth; joints swelling, often thickly clothed with hairs. Leaves and their sheaths thickly covered with a soft hoary pubescence. Spikelets, bluntly joined. Panicles, two or three inches long, erect, at first clove, afterwards a little expanding; branches half-whorled, the upper simple, the lower more or less subdivided, angular, pubescent. Spikelets, nearly upright, ovate, acute, rather timid. Florets, from seven to ten, closely imbricated, elliptical, concave, and depressed. Calyx of two unequal glumes, scarious at their edges, keeled, villous, marked with seven or nine strong green ribs.

This compound dense panicle, and its strongly ribbed, depressed, closely imbricated glumes, at once distinguish it from the two former. The B. nana of Weigel is only a stunted dwarf variety. Dr. Smith. It is a common plant in meadows; and in some parts of the north of England, constitutes a principal part of their herbage, but chiefly in fields lately laid down, and owing perhaps to its being preferred on account of its own excellence, but to the largeness of its seeds, which are more easily gathered, and consequently more profitable to the collector. Mr. Knapp informs us, that in the southern part of Scotland it is cultivated by itself like ray-gras in England. 4. B. racemosus, Linna. Polyalthus, Hudson &c. (Eng. Bot. 1779. Knap. 78.) “Panicle, nearly erect, spreading, simple; spikelets ovate, of about six imbricated, depressed, ribbed, smooth florets.” Dr. Smith. It agrees in general habit with the preceding, but is more slender; its glumes are perfectly smooth and shining, and their ribs less prominent. 5. B. pectinatus, Willd. “Panicle, spreading; spikelets, ovate, smooth, inner valve of the corolla fringed, awnless.” Thunberg. A native of the Cape of Good Hope. 6. B. lanceolatus, Willd. “Panicle, erect, spreading; spikelets, lanceolate, smooth, a little compressed; awns, at the time of flowering, straight; at the ripening of the seed, bent.” Roth. Root, annual. A native of dry situations about the Cape, fea. 7. B. alopecurus, Willd. “Panicle, clove, erect; spikelets round, awns divaricated.” Vahl. Spikelets, nearly felide, spirally twisted at the bottom. 8. B. squarrosus, Linna. “Panicle nodding; peduncles fimbriate; spikelets ovate, twelve-flowered; florets imbricated, depressed; awns divaricated.” Dr. Smith. Root, annual. Stem, a foot high, fimbriate, smooth, fringed, leafy. Leaves and sheaths pubescent, with a very short deflexed down. Panicle with few flowers. Peduncles, fimbriate, compressed, thickening upwards. Spikelets, very large, ovate, swelling, polished, closely imbricated. Calyx unequal, nerved, awnless. Corol outer glume but little larger than the calyx, many-nerved, bipartite at the summit; awns awn-like, rugged, the length of the glumes; inner glume much less ciliated with a few fainter bristles. Stem, elliptic, adhering to the corolla, villous at the summit. Native of France, Germany, Siberia, &c. Its claim to be admitted into the British Flora rests entirely on the authority of Hudson, who probably mistook for it some variety of B. secalinus. 9. B. japonicus, Willd. “Panicle, spreading, branched; spikelets oblong, smooth; awns divaricated.” Thunb. Root, annual. A native of Japan. 10. B. yedonis, Willd. “Panicle, erect, branched; spikelets ovate, with about three flowers; glumes bifid, falcate; awns divaricated.” Thunb. Spikelets, small, smooth. Glume, terminated by two awl-shaped points of nearly its own length. Awns jointed, reflexed. 11. B. purpureus, Linna. “Panicle nodding, curved; leaves naked on both sides; sheaths hairy; glumes villous.” Root, annual. Stem, a foot and half high. Flagg, the breadth of a reed, keeled, green. Sheaths with revolting hairs. Spikelets, from eight to fourteen, flowered, oblong. Gathered in Canada by Kalm. 12. B. catharticus, Willd. “Panicle, spreading, erect, nearly simple; spikelets, broadly lanceolate, fringed, rough; awns short, flat.” Vahl. Root, annual, leafy. Sheaths naked.
Spikes, broader than those of the preceding, acute. A native of Chile, whose inhabitants use a decoction of its root as a purgative. 13. B. cozensi, La Markii, Ill. "Panicle erect; spikes, ovate, smooth; glumes furnished with broad membranaceous auricles." Native of Mont-Vidiis. Commerson 14. B. merina, Reich. "Panicle erect; spikes, roundish,awl-shaped, naked, nearly awnless." Pollich. Root, perennial, extremely creeping. Stem, a foot and half high, flatirated, smooth. Leaves broad, acuminate, smooth, dark green; midrib whitish, rough. Panicle, at first close and upright, afterwards widely spreading, and nodding a little at the top. Pedicels several together, lower ones very long, upper ones very short, often quite simple. Spikelets containing from seven to ten florets. Glumes of the calyx unequal, lanceolate, concave, blunt, smooth, greenish, with broad, silvery, thin, membranaceous edges; larger glume with one green nerve, smaller with three. Glumes of the corolla unequal; larger with seven green raftered spikes, awn short, frequently wanting; smaller, flat, membranaceous, narrower, the edges rolled back, and surrounded by two green raftered spikes. Martyn quoted from Krocker Flora Sibica. La Mark in his Illus. has directed the description in Encyc. Meth. to be expanded. Native of Germany and Switzer- land. 15. B. after, Linn. Sup. ramosus, Syl. Veg. Ed. 15; but not Mantilla; meridiana, Hadison; bisatifis, Curtis; dormenta, La Mark. (Curts f. 2 Pl. 8. Eng. Bot. 1712. Knap. 8.) "Panicle drooping, branching; florets lanceolate, almost cylindrical, but finely raftered; leaves uniform, lower ones hairy." Dr. Smith. Root annual or biennial. Stem often six feet high, erect; smooth in the upper part. Leaves spreading, broad, of a full green, raftered, rough, clothed with long spreading hairs, all nearly of equal breadth; spikes smooth, with deflexed hairs. Spikelets linear-oblong, pendulous, often brownish, a little downy, Calyx-glumes very unequal. Flores about nine, raftered on the keel; awn rough, flatter than the glumes; inner glume closely flinged; its membranaceous edges bent in. Antheres suffron-coloured. Moil woods and hedges in England, Germany, Switzerland. 16. B. cebalis, Hadison, Ed. 1. pustulifera, La Mark. (Eng. Bot. 471. Knap. 86.) "Panicle, erect, a little branched; florets lanceolate, roundish, radical leaves narrow, ciliate, with white scattered hairs." Dr. Smith. Root perennial. Flatt, downy. Stem about three feet high, erect, floff and hair, smooth, rarely pubescent. Leaves linear-lanceolate, flattened, rough. S. smooth, hairy. Panicle nearly simple. Spikelets linear-oblong, compressed, erect, often of a purple hue, either smooth or downy. Calyx-glumes lanceolate, acute, keeled; the inner one larger, three-nerved. Flores from five to nine, unbranched, lanceolate, a little compressed; somewhat angular, keeled, finely raftered, rough at the keel; awns about the length of the keel, barely ciliate, hair, rough; inner glume rather downy than peltitcd. Approaching to Cellula, in which genus Dr. Smith would have been inclined to place it, if it had not to clone an affinity with B. after, an indubitable brooms. Sandy or chalky soil in England and France. 17. B. littorea, Wild. "Panicle nearly erect, rough; spikelets oblong, from four to five-flowered, smooth, nearly awnless." Reiz. Native of Sweden, Pomerania, Switzerland. 18. B. citrata, Linn. "Panicle drooping; leaves slightly hairy on both sides, as also the theae; glumes ciliated." Root perennial. Stem slender. Spikelets oblong, compressed, eight-flowered. Calyx-glumes naked. Corol-glumes lanceolate, very hairy at their edges, but not on the back. Native of Canada. 19. B. floritii, Linn. (Curts Faf. 1. Pl. 9. Eng. Bot. 1030. Knap. 84.) "Panicle droop-
ovate-lanceolate, smooth, drooping. Calyx-glumes unequal, acuminate, smooth, keeled; the inner one broad, or with three ribs. Outer glume of the corolla smooth, ovate-lanceolate, scarcely keeled, with five ribs at the summit; awn terminal, two or three times longer than the floret, ciliolate; white, sometimes a little bent; inner glume the length and nearly the breadth of the other, its edge rough, but not ciliolate. Dr. Smith, who on that account places it under the genus feltsca. Mr. Knapp says the inner valve of the corolla is minutely fringed, and in his figure, the awn is decidedly dorsal, but neither of these particulars is confirmed by our specimens gathered in Yorkshire. We have, nevertheless, continued it among the bromi, induced, rather by the general habit of the plant, than by any other consideration. A native of woods and moist hedges in the temperate parts of Europe. 24. B. rubens, Linn. "Panicle falciculately, spikelets nearly sessile, villous, awn recht." The flo- paturius of Linnaeus is suspected by La Mare, and determined by Cavanilles, to be only a variety. Root annual. Stem from seven to ten inches high, a little bent at its lower knots. Leaves smooth, short, and ciliolate. Spikelets sometimes smooth, sometimes green, often blood-red, but generally paler; awns sometimes upright, sometimes divaricated on the same plant. Native of Spain. 25. B. rigens, Linn. Mant. "Panicle spike; spikelets nearly sessile, erect, downy, with about four florets." Stems six or seven inches high, leafy. Leaves ribbed, slightly hairy on the upper surface; sheaths covering the whole culm. Spikelets scattered, tenacious. Awns nearly erect, the length of the spikelet. A native of Portugal, Vandcl. 26. B. triflorus, Linn. "Panicle spreding, with about three flowers." Stem near two feet high. Leaves with short hairs. Panicile six or seven inches long. Spikelets oblong, pointed. La Marck. Native of Germany and Denmark. 27. B. dianthus, Curtis; ma- drifenst, Linnaeus; murialis, Hudson, 2d ed. citatus, 1st Ed. dilatatus, La Mare; (Curtis Flor. Lond. Fafe. 1. Pl. 9. Eng. Bot. 1006. Knap. 83.) "Panicle upright, spreading, scarcely subdivided; florets lanceolate, ribbed, furrowed with only two lamens." Dr. Smith. Root annual. Stems a foot and half high, erect, stiff, slender, ciliolate, smooth. Leaves often entirely smooth; sheaths ribbed, a little keeled, generally smooth, but sometimes with hairs pointing downward. Spike short. Panicle scarcely three inches long, erect. Spikelets linear-lanceolate, erect, rough, often brownish. Florets diandrous, slightly ribbed, the two principal ribs fanding peculiarly close to each other. Found by Dr. Withering in Portugal, and by Dr Joseph Banks at the foot of St. Vincent's rock near Bristol. It is probably the same plant with the B. rigidos of Willdenow, who does not appear to have known that the madritiflos of Linnaeus is diandrous. 28. B. filipoides, Linn. Mant.; incrassatae, La Marck. Encyc. Method. "Panicle erect, ovate-pyramidal, spikelets smooth, about four-flowered, pedicels flattened, and enlarged above." La Marck. Root annual. Stem six or seven inches high, slender. Leaves narrow, smooth. Panicle upright, rather close, oblong, Spikelets smooth, greenish, or tinged with purple violet. Florets three or four, each supported by a pedicell, broader and flat towards the top. Awns faint and perfectly terminal. A native of Italy and Spain; described by La Marck from a living plant. 29. B. romanus, Linn. "Stem much branched; spikelets sessile; leaves involute-fubulate." Root perennial, creeping, hard, jointed, producing at different intervals tufts of leaves and stems. Stems a foot and half high, slender, smooth, leafy; throwing out toward the bottom short, alternate, generally barren branches. Leaves short, glaucous, rolled up. Spikeets from three to five, from eight to ten-flowered; awns short, terminal, resembling those of B. pinnatus. La Marck. On the shores of the Levant and Portugal. 30. B. pinnatus, Linn. "Spike simple, erect, two-rowed; spikelets sessile, roundish; awns shorter than the glume: leaves almost naked." Dr. Smith. Root perennial, a little creeping. Stem a foot and a half, or two feet high, erect, fimbred, round, leafy, very smooth, straight, and rigid, scarcely tapering. Leaves somewhat erect, lanceolate, acuminate, rather rigid, ciliated, nerved, rough, often naked, rarely hairy on the upper surface. Sheaths smooth and polished, (Dr. Smith,) generally hairy (La Mare and Knapp, with whom our own specimens agree.) Spikelet short, obtuse, ciliated. Spikelets from six to ten, downy, often curved. Calyx-glumes rather elliptical, somewhat awred, many-nerved. Florets twelve or more, closely imbricated, nerved, and hairy, chiefly towards the summit; awn terminal, shorter than the glume, sometimes very short, rough; inner glume elated with great brillles. Native of a dry calcareous soil in many parts of Europe. In England, not uncommon in Yorkshire, Ox- fordshire, and Kent. 31. B. sylvaticus, Pollich; gracilla, Weigel and Wildenow. "Spike simple, drooping, leaving one way; spikelets sessile, roundish; awn longer than the glume; leaves hairy." Root fibrous, tufted, perennial. Stems two feet high, round, leafy, tapering, very slender, and a little drooping in the upper part. Leaves spreading, flat, pointed, a little rigid, rough, ribbed, more or less hairy, bright green. Spikelets stragiit, close, hairy. Spikelet short, blunt, torn. Spike simple, drooping, zig-zag. Spikelets six or seven, alternate, sessile, cylindrical, linear-lanceolate, generally downy. Glumes of the calyx unequal, with short awns. Florets from six to nine, imbricated, in the upper part strongly ribbed and rough; awn terminal, rough, generally much longer than the glume; inner glume fringed like the preceding; superseded by some to be only a variety of B. pinnata; but they cannot be con- founded by any one who is acquainted with their native habits and places of growth. Frequent in copses and thickets, especially in a gravelly soil. 32. B. crisalus, Linn. "Spikelets imbricated in two rows, sessile, depreplexed." Root perennial. Stem about half a foot high, downy, leafy, lower sheaths villous. Spikelets about two, downy, four-flowered. Awn terminal. La Marck. A native of Siberia and Tartary. 33. B. dajlachys, Linn.; platylachys, La Marck. Illuit. "Spikelets three or four, erect, compressed, rigid, fesile; glumes ciliolate." Root annual. Stem from six to ten inches high, leafy, a little bent at the knots. Leaves rather short, soft, and ciliolate at their edges. Spikelets large, alternate, from two to five. Florets eight or nine. Awns long, straight, terminal; the external glume ciliolate. La Marck. A native of the southern provinces of France. The last six species have the terminal awn of fescue. Hudson and Knapp have accordingly referred the pinnatus and sylvaticus to that genus, in their arrangement of Brititish grasses; but Dr. Smith, partly on account of their general habit, but chiefly of their ciliated interior coroll glumes, has continued them among the bromi. The last five have the inflorescence of triticum.
The French name, goître, or goütrée, is evidently a corruption of the Latin word guttura, the throat; and although M. Louis has maintained, that the bronchocele and the goître ought not to be mistaken for each other; these two names are now fo universally applied to a similar affection, that it would be vain to attempt any correction of the appended error. Vide Encyclopædia, Art. Goître, composed by M. Louis. In another place he says again, "Il ne faut pas confondre, comme on fait affez communément, la bronchocele avec une autre tumeur du cou qu'on nomme goître." Art. Bronchocele, ibid. He would confine the term bronchocele to an hernia of the wind-pipe, which, in his opinion, may be cured by compressing the tumour with a suitable bandage and cushion.

Upon the disorder which constitutes the subject of the present article, we know not any author who has written so amply and experimentally as M. Foderé, who had many opportunities of observing the bronchocele in all its stages, where it prevailed as an endemic disease.

This affection more frequently attacks females than males, children than adults, and relaxed or delicate constitutions than those which are rigid and vigorous; but it will sometimes affect persons of apparently good constitutions, and of either sex, on their going to reside in the low valleys beneath the Alps, the Pyrenées, the Apennines, &c., where it is endemical and hereditary. Scrofula and rickets seem to make the greatest ravages among people who are liable to bronchocele; but M. Foderé is positive that the latter disease, nevertheless, differs materially from the former; and that the goître is purely a local complaint of the neck, unattended with the least danger, except it occasion violent mechanical pressure by the enormous bulk of the swelling. Vide chap. v. § 19. to 24. Traité du Goître et du Crétinisme.

The remote physical causes which have been assigned for this disease, are various and unsatisfactory; viz. the drinking of hard, cold, or snow-water; the use of alimentary substances not sufficiently nutritious; the repulsion of some cutaneous disorder; the abuse of vinous or spirituous liquors, &c. Theories, which have been founded on any of these supposed causes, are too hypothetical, and are contradicted by numerous facts; besides which, the bronchocele will be found to prevail where none of these causes exist in a striking degree, as several writers have sufficiently proved. The disease, however, is known to predominate most in countries affected by great humidity of the atmosphere, joined with excessive heat; it augments in the spring-time, and diminishes in the autumn; it is less prevalent in a cold and dry winter, than during a season of dampness and moderate warmth; it is even said to be influenced in its progress, wherever it is endemical, in exact proportion to the degree of moisture indicated by the hygrometer. These facts are established by the observation of M. Foderé and Villars, after numerous and varied experiments.

We cannot, moreover, acquiesce in the explanation which has been offered respecting the proximate cause of this disease, or the phenomena of which it consists. The thyroid gland, some writers tell us, contains a viscid humour, which continually lubricates the larynx and trachea by its exudation, and it is the flagellation or detention of this humour in the capillaries of the gland, lay they, which forms the disorder in question! But, we ask, have the uses of the thyroid gland been ascertained? Has its minute structure been developed? Have there been any mucous ducts or outlets detected? Is it really a secreting organ? Further, we are told, that the humid air is imbibed by the cellular texture of this gland; that it thereby becomes expanded, or tumesced; that its secretory

Who has not heard of the swelled throat of the Alps?
ectory ducts are thus obstructed; and that bronchocle con- 
fits altogether in this laxity or atonic state of the organ.
But, surely, all this is hypothetical; for, even supposing the 
imhibition of moit air to take place (which, however, re- 
 mains to be proved), would it not be received into the ab- 
sorbent vessels, and transmitted to the thoracic duct? And, 
why should it be imagined, that the thyroid gland imbibes 
the moit atmospheric air, more than other parts of the body 
which are equally exposed? 
Upon the whole, we see no reason for adopting the above 
result, however respectably it has been supported; and we 
do not feel competent to offer any explanation of the 
proximate cause of this disease. Perhaps some light will 
be thrown on the inquiry, when we are better informed as 
to the economy and natural use of the thyroid gland; but, 
for the present, we are without doubt, or analogous 
sufficiency, to afford a legitimate conclusion. We proceed, therefore, 
to the means which have been employed for the prevention 
and cure of this complaint; a subject on which much has 
been said and written, although not to the entire satisfaction 
of practitioners or patients in general.

As to preventive measures, they must chiefly consist of such 
as tend to moderate the heat and air of those places wherein 
the bronchocle is endemic. It be a fact, that marby lands, 
an humid atmosphere, deep and woody vales, sur- 
rounded by lofty hills, which intercept thefulous breezes, 
are among the physical causes of this disease; the prevention 
must partly depend upon the removal or avoidance of such 
causes; and this should be especially attended to by persons 
who are naturally of a delicate or soft fibre, and are there- 
fore predisposed to debilitating complaints.

The curative means are either medical or surgical. The 
internal remedies, which have acquired the greatest reputa- 
tion, are burnt sponge, soap, sulphurated kali, prepared 
patron, and artificial soda-water. It has been advised to 
exhibit a dose of calomel and neutral salts once a week, 
during the use of the other medicines; likewise to keep the 
neck warm; to refide in a dry, pure atmosphere; and to 
swallow the above-named remedies very slowly, which is 
particularly injudicious if the patient take these medicines in a 
fluid form. Authors have also alleged, that benefit is some- 
times derived from the external application of mercurial oint- 
ment, blistering plaster, sop liniment, camphorated oil, dry 
frictions, moderate compression, and electrical sparks. But 
of all these means, the burnt sponge, made into lozenges, 
has received the highest encomiums. For our own part, we 
have been disappointed in our expectations from these lo- 
zenges; although many practitioners consider them as almost 
infallible, if properly administered and persevered in. The 
following is the formula recommended by Mr. Ring:

Take of Burnt sponge, two ounces; 
Powdered gum Arabic, two drams; 
Powdered cinnamon, half a dram; 
Simple syrup, enough to form the whole into 
a mass, which is to be divided into forty-eight portions. 
Care must be taken that no more syrup be used, than is abso- 
lutely necessary to make the dry ingredients properly cohere; 
for which reason, it must be added slowly, and the mass must 
be well beaten. The lozenges are to be dried before a fire, 
on a plate which has been slightly oiled, to prevent them from 
flaking; and they must be kept in a bottle or gallipot, 
tied over with a bladder.

One of these tablets is to be exhibited three times a day, 
for a considerable time. Some practitioners, indeed, have 
given so much as fix or eight drams of the burnt sponge 
daily, without any inconvenience; and, too often, without 
any benefit to their patients. It would be defraying the at-
tention of surgeons, to ascertain, if possible, the cause of 
this diversity in their successes; and whether the nature of the 
affection, in the cases said to have been cured by the use of the 
sponge, does not essentially differ from those in which this 
remedy has been taken largely to no good purpose.

Dr. Herrenfeld, of Peru, thinking that the burnt 
sponge has a tendency to injure the flammach, and produce 
a leucorrhoea, advises that it should not be calcined, but em- 
ployed in decoction; and this, he says, is equally efficacious. 
Whereas, Mr. Poucré prefers it to be only half-burnt, and 
mixed with honey and camilla alba; of which the bulk of a 
large nut is to be taken three times a day, for several weeks.

This last author tells us, he has seen an extremely large 
swelling of the neck dispersed by the daily use of thirty 
grains of the sulphate of potash, dissolved in a pint of water; 
and he considers the cure as more easily effected, by requiring 
the patient to take a cathartic every week, during the whole 
time of the medicinal course; by keeping the neck very 
warmedly covered; by swallowing the burnt sponge, &c. inten- 
sibly, or holding it a considerable while in the mouth; by 
beginning the remedy at the decline of the moon; and by 
changing the air to a dry or open situation, which, indeed, he 
regards as indispensably necessary.

The success will also much depend on the patient's being 
young, and otherwise healthy; but if the swelling be of a 
febrile or indurated nature, there is very little hope of 
relief, except by a manual operation, such as Cornelius Cel- 
tius long ago recommended. However, the extirpation of 
the tumour can hardly be undertaken, unless it be detached, 
certified, and heated at the fore-part of the neck.

The swelling being situated in the vicinity of so many im-
portant organs, will deter a surgeon from hastily proposing 
its cure or excision; besides, there are cases related, in which 
the mere opening of the cyst has affected a cure; and, in 
these cases, the contents were either evacuated at once, or 
gradually lefioned by suppuration. When there is an evident 
fluctuation of matter, a fenton drawn through the tumour 
might perhaps be advantageous; or, as Celsus and others 
have suggested, the application of a caufical might be par- 
tially useful; but, if the life of a patient be not endangered 
by this disease, it would be prudent to avoid such irritating 
means. Although the ulcer which remains after the use of a 
caulic will sometimes be exceedingly deterring and dif- 
cult to heal, we are not of opinion, with Mr. Benjamin Bul- 
ly, that it ever "degenerates into a cancer."

We ought not to conclude this article without alluding 
to a celebrated remedy, prepared and sold at Coventry, for 
the cure of bronchocle. It is generally supposed to be 
lefs efficacious than burnt sponge alone, and to consist of 
equal parts of sponge, cork, and pumice stone, calcined; 
which is formed into a bolus, with sugar or syrup, to be laid 
under the tongue every night. Mr. Procter, who published 
an account of the bronchocle and its treatment in 1711, 
recommends the following powders, in preference to the 
Coventry medicine:

R. Cinnab. Antimon. opt. levig. ʒj. 
Milleped. pp. & pulv.
Spong. calcin. ąą gr. xv. m. f. pulvis.

One of these is to be taken an hour or two before break-
fast, for two or three weeks; and after the interval of about 
a fortnight, they are to be again renewed; and three of the 
following pills are to be taken at bed-time, during the second 
course of the powders:

R. Pil. Mercurial. ph. nov. ʒ ʃ.
F. Pil. N° 48. æquales.

The dose is to be adjusted to the age and constitution 
of the patient, who should be prepared for this course by two
or three previous purges, and avoid taking cold. If these means be used for about a month or six weeks, without any external application, Mr. Procter has no doubt of success. However, the patient should be under twenty-five years of age. At this age the cure is uncertain; but at a more advanced period of life it is much more improbable, and seldom or ever succeeds. Mr. Goosche, in his "Medical Observations," mentions an example: Bronchocele; and so does Mr. Davies in the Med. and Phyf. Journal, No. 7, Jan. 1803.

BRONCHITIS, Peter, a painter of perspective and history, was born in 1758 at Delft, where he learned the art of painting. His subjects were views of ancient and modern churches, which he executed with great success. In the council chamber at Delft are his "Judgment of Solomon," and "Christ driving the money-changers out of the temple," described as performances in which the architecture is elegant, and the figures carefully finished. He died in 1762. Pilkington.

BRONCHOPHANT, John Van, a painter of history and landscape, was born at Utrecht in 1661; and as he discovered an extraordinary genius before he was 11 years of age, he was placed under the direction of John Verburg. He was afterwards for some time assistant to Peter Mattys, a painter on glass, at Brabant. After his return to his own country, he entered the school of Cornelius Poelenburg, and being charmed with his taste of design, pencilling, and colour, imitated his style with great success. Till his 36th year he painted on glass; but after that time in oil, after the manner of Poelenburg, and obtained a lauding reputation. In the choir of the new church at Amsterdam, there are three of his paintings on glass, which are exhibited as curiosities; and in the same church, on the folding doors of the organ, are three historical paintings in oil, "the triumph of David over Goliath;" "the anointing of Saul;" and "the attempt of Saul to kill David while he was playing on the harp," which are excellent performances. He also amused himself with the point, and some landscapes from Poelenburg, and other subjects from his own composition, are attributed to him. Pilkington and Strutt.

BRONCHORST, Peter, was born at Leyden in 1648, and, from an obscure original, arrived, by the power of his own genius and ineflent application, without any mallet, at distinguishing excellence as a painter in water-colours. His subjects were birds and animals of all kinds, which he copied after nature with uncommon life, exactness, and expression. He died in 1723. Pilkington.

BRONCHORST, or BRONCHOTUS, in Geography, a town of the United Dutch States, in the county of Zutphen; 5 miles N. of Doeburgh.

BRONCHOTOMY, in Surgery, is the operation of cutting into the trachea or wind-pipe; from βρόντος and τομή. It has been also named Laryngotomy, and Tracheotomy; although there can be no reason whatever for employing the latter term in preference to the usual appellation. Mr. Benjamin Bell, however, has said, that as bronchotomy "confists in an opening made into the trachea, and not into the bronchus, it ought more properly to be named trachotomie;" but to such hypercritisins, we can only reply, in the language of M. Petit-Radet: "Quelsques nomenclateurs, peu instruits dans la langue Grece, et ignorant que les anciens denoignoient le tracheé fou le nom de βρόντος, qu'ils ont confondu avec βρόντος, qui font les an- neaux des subdivisions de ce canal, ont mieux aime désigner cette operation sous le nom de trachétomie ou laryngotomie; mais ces dénominations n'ont pu généralement prevaloir." Encyloc. Méthod. Art. Bronchotomie.

The operation of bronchotomy may be practiced, with greater or less probability of success, in cases where a patient is in danger of suffocation, from an obstacle in the trachea, or a concretion of the glottis. There may be likewise a necessity for our resorting to this operation, where the trachea is compressed by a tumour externally, or where the tonsils and parts adjacent become so enlarged as to impede respiration considerably. In short, should any mechanical cause be supposed to exist, of threatening suffocation and impending death, the surgeon's duty will be too plain and imperious to admit of hesitation: an incision must be made into the trachea without a moment's delay, unless some other obvious remedy can be suggested for the patient's relief. The cases to which we here allude are so various, that they cannot be all enumerated; but no well instructed practitioner will suffer any person to lose his life, for want of an operation so easily performed, so little attended with bad consequences in itself, and so certainly efficacious in a multitude of examples which frequently occur.

Perhaps few, if any, chirurgical means can be proposed for the relief of a patient in extreme danger, so revolving to mankind, as this of bronchotomy. A general and long established prejudice prevails against it, arising from an erroneous opinion, that "wounds of the wind-pipe are always mortal." Although this opinion is refuted by almost daily observation, and numbers of people have recovered after cutting their own throats (i. e. dividing their trachea) in the most horrid manner; yet still, the popular notion exists, and must be encountered. It is therefore advisable, prior to the performance of this operation, that all the reasons which influence the surgeon's decision, should be stated fairly, and the probable or certain consequences of a different procedure be judiciously represented to the patient or the bystanders, to prevent any groundless blame in the event of ill success.

As the cause of interrupted respiration may be different, on different occasions, so must there be a variety in the manner of performing this operation, according to the existing circumstances: in some cases, a simple incision into the wind-pipe, about half an inch below the cryoidal cartilage, will effect the relief we wish for; but, in other cases, the wound must either be kept open by a canula; or a portion of one or two of the cartilaginous rings must be cut out, in order that the patient may continue to breathe with facility through the artificial orifice. Sometimes, again, it may be requisite to make a second opening, with a view to assist us in the extraction of a foreign substance; and when that object shall have been attained, probably there will be no further necessity for an artificial air-hole remaining open in the trachea, so that the external as well as the internal wound may be healed with all convenient speed.

When it is required that the patient should breathe for some time through the wound, we would think, be generally preferable to cut out a portion of the cartilage, (which has been often done with safety), rather than to haraafs the patient by keeping a metallic canula in the wound, between the divided cartilages. An incessant coughing and sputa of unexpelable nature will be likely to ensue from the presence of a canula, which might, therefore, be a source of greater mischief than could possibly arise from the removal of a small piece of cartilage. Every person knows what distressing consequences immediately follow on the admission of only a crumb of bread into the glottis: and how aggravated must the sufferings of a man be, who has a silver tube remaining in his larynx or trachea for several days, especially if it happen to touch the opposite paries! Should an extraneous body be lodged in the trachea, it is not always capable of being removed without making an incision across three or four of the cartilaginous
laginous rings, (i.e. in the direction of the wind-pipe itself), exactly opposite, or a little below the foreign substance.

Several kinds of instruments have been proposed for executing this simple operation; such as concealed lancets, trocars and canulae, guarded scalpels, &c. But, we cannot conceive what hazard or difficulty should occur to a surgeon who is at all used to handle a common dissecting knife, in making a longitudinal incision through the fore-part of the neck and trachea. We are very much inclined to simplify all surgical operations and instruments; rather than to make a parade, which sometimes tends to magnify real difficulties, or to create imaginary ones in the eyes of a young practitioner. Besides, the operation of which we are now treating is among the number of those which usually call for prompt and definitive measures; wherein the surgeon has no opportunity, (except in large cities), to search for curious instruments, and, therefore, should feel confident, that his business may be well performed without them. The apparatus essentially necessary, on this and many other important occasions, will, doubtless, be in the possession of every surgeon, or may be easily obtained when called for.

The following has been recommended as one of the best modes of performing the operation of Bronchotomy:

The patient is placed upon a low floor, or in that posture in which he finds it most easy to breathe; his head is held upright, but by no means bent backwards, and secured by an assistant. Opposite the third or fourth cartilaginous ring of the trachea, the skin is now drawn up into a high crois fold; and it is cut through exactly at the middle of the trachea, to such a depth, that when the fold is let go, the incision extends itself longitudinally from the first cartilagenous ring down to near the upper extremity of the sternum. By making the incision of a proper length, the operation will be greatly facilitated, as its edges can then be drawn farther from each other.

As soon as the hemorrhage has been entirely stopped, that part of the trachea, where the incision is finally to be made, must be laid bare, by dissecting away the cellular substance and mucular fibres situated about the membranous interface between the third and fourth ring, and by either entirely removing them or preserving them sideward. The operator then places the nail of the fore-finger of his left hand upon this interface; and applying the thumb and middle finger of the same hand to both sides of the trachea, he presses the point of his instrument, which must previously be dipped in some fresh oil of almonds, along the nail of his fore-finger, through the above mentioned membranous interface, between the third and fourth cartilaginous ring, into the trachea. He then applies the fore-finger of his left hand to one or the other of the cartilaginous rings, close to the tube or canula, in order to hold it back whilst he withdraws the blade of his instrument. If we make use of Richter's curved instrument, we must move the hand upwards in pushing it in, in order that we may turn the point of the instrument downwards, and prevent its touching the back part of the trachea.

But in order that we may prevent the tube from flipping out of the wound, and also to prevent its moving to and fro in the trachea, several foils are introduced above and below into the wound, so as to keep the lips abaf. To the rings, on both sides of the external opening of the tube, two narrow slips of linen are applied, which prevents the rings down upon the trachea; and the whole is covered and secured with adhesive plaster. And that none of the fluids which are collected in the wound may make their way into the canula and wind-pipe, the patient must lie or sit inclined on one side, and the wound must, from time to time, be wiped dry with a sponge. When the tube fills with mucus, it must be cleared with a small feather; or two such tubes may be employed, one enclosing the other, and either of them removed, when necessary, for the purpose of clearing it of mucus.

As an improvement upon the instruments hitherto employed, Mr. Benjamin Bell proposes one which has nearly the form of a flat straight trocar, and ought never to be less than two inches in length. Before it is passed between the two cartilages, it must first be thrust through several linen or camphor, which not only serve to cover the pledget of ointment intended to protect the wound, but also produces the advantage that (by removing one or more of the compresses, which may be done by cutting them open at the sides with a pair of forceps,) we are able to increase the length of the tube at pleasure. In order to secure the tube in the situation where it is left after the operation, he passes it through an opening in a plate of polished steel, which is curved so as to fit to the shape of the fore-part of the neck, and fastened behind with fraps and a buckle. To prevent any foreign substance from getting through the orifice of the canula into the trachea, it may be covered with a piece of fine gauze, which should previously be wetted, that the dust may not penetrate through it, but stick to the outside.

When the caue which gave rise to the operation has been removed, and the patient can again breathe through his mouth, the tube is withdrawn, and the orifice healed up like any other wound of the wind-pipe; in doing which great caution should be used, lest any thing should get into the trachea, which might produce dangerous consequences.

Mefira. Chopart and Default propose, that the incision into the trachea should be made between the thyroid and cricoid cartilages, and through the ligamentum crico-thyroidenum; which, however, we cannot recommend, on account of the far greater sensibility and irritability of the larynx, whereby the most violent symptoms, threatening immediate asphyxiation, might be excited.

When this operation becomes necessary, on account of any foreign substance lodging in the trachea, it may be performed in the following manner. The intagments are first divided as above described; and a longitudinal incision is made at the anterior part of the trachea, from above, downwards, through three or more of the cartilaginous rings. An assistant then draws aside the sides of the wounded trachea with a blunt hook, upon which the operator introduces a crooked forceps, with which, he carefully seeks for, and extracts the foreign body.

In this case, it is also indispensably necessary, that the hemorrhage from the external wound should be entirely stopped before any incision is made into the trachea, as otherwise a very violent cough would be excited.

If an extraneous substance should stick in the larynx, it might perhaps be dangerous, (as some have advised,) to cut the thyroid cartilage longitudinally, since this operation would excite very violent coughing; and might likewise be superfluous, if it were possible to lay hold of the foreign substance with a crooked forceps, introduced through an incision made at the usual place, below the cricoid cartilage.

BRONCHUS, in Anatomy, properly denotes the lower part of the alpera arteria, dividing into bronchi, or branches. In which sense bronchus stands contradistinguished from larynx.

The name bronchus is also extended to the whole alpera arteria, or trachea.

BRONCHUS also denotes a percif afflicated with a bronchodele, or tumour of the throat, called by Ulpin guitturoso.
BRONCOLI, Thomas, in Biography, a Neapolitan physician, who published in 1622, 4to. "De populari horribi et praelentii Gutturis et neuerarum Partium Alctione, Neapolit. et totem fere Regnum vexante, Condilium." This is an early account of the *scarlatina anginosa*, which seems not to have made its appearance in this country until about the middle of the last century, when Dr. John Fothergill published an accurate account of the disease, with the method he had found most successful in treating it. He is very earnest in advising the brethren to be careful in distinguishing it from the common quinia, as it requires a mode of treatment very opposite to that of diphteria. The *scarlatina anginosa* has of late years become one of the most frequent, as well as most infectious and dangerous epidemics that visit this country.

BRONE, in Geography, a river of Switzerland in the Valais, which joins the Rhone near Sion.

BRONGUS, in Ancient Geography, a river of Media, which, according to Herodotus, discharged itself into the littor.

BRONI, or BRONNO, in Geography, a town of Italy in the Milanese, where the French were defeated by the Imperialists in 1703; 10 miles S.W. of Pavia. N. lat. 41° 50'. E. long. 10° 6'.

BRONTAZA, a village of Russia, seated on the Mafa, within 20 miles of the Novgorod. In this village an excellent caviare is prepared of the roe extracted from large quantities of fish caught in the Mafa. At the distance of about 2 miles is an infallable well of sand and clay, of a circular form, the lower parts of which are thickly strewed with detached pieces of red and grey granite. This eminence was remarkable in the times of idolatry for an oracular temple, the site of which is now occupied by a brick whitewashed church.

BRONNIKOO, a town of Siberia, on the Irkuteh, 28 miles N. of Tobolbe.

BRONTES, in Entomology, a species of Papilio (Pleb. Urb.) of a small size, that inhabits Africa. The wings are subcubicated, above and beneath fulvous, with a band on the first pair, and margin of the second snowy white. Fabricius. Obs. In Spec. Inf. of that writer it is described under the specific name of *Annus*.

BRONTES, it is also the name of Papilio Panicus, in some German writers.

BRONTUM, in Antiquity, that part of the theatre underneath its floor, wherein bronze vessels, full of flones and other materials, to imitate the noise of thunder, were kept. Potter. Arch. Grce. Lib. ii. cap. 8.

BRONTI, in Geography, a town of the island of Sicily, 28 miles W. of Taormina.

BRONTLE, among Naturals, a kind of figured flones, commonly hemispherical, and divided by five pointed zones.

The word is formed from *fionis*, thunder; alluding to the popular tradition, that those flones fall in thunder showers; whence they are also denominated thunder-flones; sometimes polar-flones, fairy-flones, and also ombril, by naturalists.

Some take the *brontie* for the petrified shells of the *cebus spatagus*, or breeufs, of Ariflotle. Dr. Woodward rather supposes them to have been formed, and received their shape, in the shell of the *cebus spatagus*; on which supposition they are also ranked in the number of echinites. Dr. Plott contests both.

*Brontie* are sometimes also used in England for a kind of figured flones, shaped like arrow-heads, less properly called areomites, and popularly thunder-bolts.

Dr. Woodward takes not thefe for natural flones, but supposes them to have been fashioned thus by art, to serve as weapons before the invention of iron.
Bronze, in Painting, denotes a colour prepared by the
colourmen of Paris, in imitation of bronze. There are two
forts of it, the red and the yellow, or golden; the latter,
the yellow, is made solely of the finest and brightest copper-
thief that can be had; and in the former there is only added
a small quantity of red ochre, well pulverised. They are
both applied with varnish, and, to prevent its turning
greenish, the work is dried over a coaling-dich, as soon as
bronzed.

Bronzerius, John-Jeron, in Biography, was born
of wealthy parents, in a small town in the Venetian territory,
in 1577. After making great progress in the study of the belles
lettres, philosophy, and astronomy, he was sent to Padun,
where he was initiated into the knowledge of medicine and
anatomy, and in 1597, was made doctor. He now went to
Venice, where he practised medicine to the time of his
death, in 1630. His publications are, "De innato
cindo, et naturali sua, in quo pra veritate res Galeni
dominica definitor," 1626, 4to; "De Principi
Pathepis ex Anatomie Lamptes," Patav. 4to. Though
from defecating the liver of this animal he was satisfied
the blood did not acquire its red colour there, yet he did
not chuse to oppose the doctrine of Galen. His observation,
however, was probably not lost, but led the way to a more
complete discovery of the fact, by subsequent anatomists.

Anat.

Bronzes. Thus Antiquarians denominate figures of
men or beasts, urns, and every piece of sculpture, which
the ancients made of the above metal. Statues, busts, &c.
call of this metal, are called by this name, whether they be
originals or copies.

Bronzing is the art of imitating bronze. See Bronze,
in Painting.

Bronzing, Agnolo, a painter of history and portraits,
born at Florence, in 1511, and became the disciple of
Puntormo, with whom he continued for several years,
and whose style he acquired to such a degree that the paintings
of one and of the other could not be readily distinguished.
His extraordinary abilities are sufficiently evinced in all
his performances. Among others, at Florence, a "Nativity"
is mentioned as incomparable; and also a "Venus,"
embracing Cupid, attended on one side by milhful loves,
and on the other by jealousy, fraud, and other passions, alleg-
oriically represented. The composition and finish
in both these are highly extolled. As his master, Puntormo,
died before he had finished the chapel of St. Lorenzo, at
Florence, the duke appointed Bronzon to complete it.
Bronzino also distinguished himself in the painting of por-
traits; particularly those of Andrea Doria, Dante, Boccaccio,
and Petrarch, and of all the illustrious personages of the house
of Medici. His works at Florence, Pisa, and Pisa,
bear bearing testimony to his merit; nor was he less repected
and esteemed for his amiable qualities than for his professional
talents. His style of design was grand; his pencil neat, but
free; his colouring refined that of Puntormo; and in his
drawings he imitated the manner of Michael Angelo Buona-
roti. He died in 1588.

Pilkington.

Bronzolo, in Geography, a town of Germany, in
the county of Tyrol, seated on the Adige; 5 miles S. of
Bolzano.

Brood, the young of fish and fowls.
The word is derived from the Saxon brodon, to breed;
which alludes to &rvar, to be big with young. The word is also
used for a set of any young. In which sense we say, a brood
of vipers, a brood of oysters. A brood of pheasants is more

Brood of sea-fish is spawned, and lies in still waters,
in which it may have reft to receive nourishment, and grow to per-
fecion. And here it is often destroyed by weirs, draw-nets,
and nets with canvas, or like engines in the bottoms of them;
in harbours, havens, and creeks.—Every weir near the main
sea takes, in twelve hours, sometimes five bushels, some-
times ten, sometimes twenty or thirty. For the preventing
hereof, by J. J. in cap. 12. is enacted, that none shall
create a weir, or weirs, along the sea-shore, or in any haven,
or creek, or within five miles of the mouth of any haven
or creek, or shall willingly destroy the spawn or fry of fish,
on pain of 10s. to be divided between the king and the pro-
ducer. Neither shall any one fish in any of the said places,
with any net of a lefe mesh than three inches and a half
between knot and knot (except for the taking fowrels in Nor-
folk only), or with a canvas net, or other engine, whereby
the spawn or fry of fish may be destroyed; on pain to forfeit
the said engine or net, and 10s. in money, to be divided
between the poor of the parish and the producer.
Brook, or Brood-corn, called by the French courain,
is that part of the comb of a bee-hive, which contains in its
cells the future progeny of the hive, in the three different
flakes of eggs, worms, and nymphs. See Bee, and Queen-
bee.

Brooding, the act of a hen, or other bird, sitting
on a number of eggs, to keep them warm, till they hatch, or
produce young ones. See Hatching.

Brook, a little river or small current of water. A
brook is sometimes distinguished from a river by the latter
flowing continually, and the former only occasionally.

Brooke, Sir Robert, in Biography, an eminent lawyer
of the 16th century, was born at Cleaverly, in Shropshire,
educated at Oxford, and from thence removed to the Mid-
dle-Temple. In 1552, he was called to be Serjeant at law;
and in 1553, appointed lord chief justice of the common
pleas; about which time he was knighted. He died in
1558, leaving behind him the reputation of great skill in his
profession, and of integrity in the exercise of it, both at the
bar and on the bench. His works are "An Abrigment,
containing an Albract of the Year-books, till the time of
Queen Mary;" "Certain Cafes adjudged in the times of
Henry VIII., Edward VI., and Queen Mary, from the 6th
of Henry VIII. to the 4th of Queen Mary," and "Reading
on the Statute of Limitations, made 32d Henry VIII.
cap. 2."

Brooke, Henry, an ingenious author in polite
literature, was the son of a clergyman, and born in Ireland
in 1706. Having commenced his education under Dr. Sheri-
den, and professed it in Dublin college, he removed to the
Temple; where his lively genius and agreeable temper con-
cluded the esteem and attachment of many friends. After
his return to Ireland, he privately married his cousin, an
amiable young lady, at a very early age, of whom he was
appointed guardian, and lived for some time in domestic
retirement; but his increasing family obliged him to exert his
abilities for their support. With this view he came over
to London, and, as it is said, under the eye of Pope, wrote
his philosophical poem of "Universal Beauty," in 1735.
He returned again to Ireland, and engaged in the practice
of the law; but his predominant desire of acquiring distinction
in poetry and elegant literature induced him again to visit Lon-
don, where he produced a tragedy, entitled "Guilvab- Vafa,"
and containing sentiments of liberty so strongly expressed, that
government prohibited its public exhibition at the theatres.
This opposition excited an enthusiastic ardour among his
friends,
friends and party, at the head of whom was Frederick prince of Wales; and the play was published by subscription in 1739, much more to his advantage than if it had been acted. Warmly attached to his royal highness, Brooke took a house at Twickenham, near Mr. Pope's, and sent for his wife, who was proposed by the prince as wet-nurse to a child, of whom the prince was then pregnant. But his expenses exceeding his income, he was prevailed upon by his wife to part with his house, to diminish his servants, and to retire to privacy in his native country. His attachment to the muses, however, continued; and in 1745 his tragedy, entitled “The Earl of Weltham,” was acted at Dublin; and in the same year he published his “Farmer’s Letters,” which were addressed to the people of Ireland, and designed to promote the principles of liberty and patriotism. At this time he was patronized by the earl of Cheltenham, then the lord-lieutenant, and appointed barrack-master. As a poet he afterwards distinguished himself by three pieces, communicated to the public in Moore’s “Fables for the Female Sex,” 1747. His piece, entitled “The Female Seducers,” has been peculiarly admired, not only for tenderness and pathos, as well as sublime poetry, but for the devotional spirit which always characterized the author. Disappointed in his views of farther advancement, he retired into the country, in company with an only brother; where they reared together their numerous families, with mutual harmony and affection. His intervals of leisure were employed in writing dramatic pieces and novels, the former of which he hoped to have introduced on the London stage. But though Mr. Garrick would at one time have engaged him as a writer; his proposals were not duly regarded by Mr. Brooke, who flattered himself with more encouraging prospects, and they were, therefore, never renewed. His tragedy of the “Earl of Effex,” however, which had been acted at Dublin, in 1749, was also performed at Drury-lane in 1760: but as to his other tragedies and comedies, it does not appear whether they were exhibited in any theatre. In 1762 he published a treatise in 8vo. entitled “The Trial of the Roman Catholics,” favourable to that class of Irish subjects; and in 1766, his novel, called “The Pool of Quality,” which attracted considerable attention, though its general plan was wild and incoherent, and the latter volumes were strongly tainted with methodism, in which the religious fervour of his mind at length terminated. Generous and sympathizing in his disposition, and deliberate of economy, he was reduced to the necessity of mortgaging, and, at length, of selling his patrimony; in conformance of which he retired for some years in a rented house at Kidder, which he afterwards quitted for a farm near his former habitation. The affliction of losing his wife, after an union of nearly 50 years, and also of a favourite child, depressed his spirits and deranged his understanding to such a degree as to terminate in almost total imbecility. His novel, entitled “Juliet Grenville,” published in 1774, indicated still more feebly than the last volumes of the Pool of Quality, the decline of his faculties. His two poems, viz. “Redemption,” and the “Fox-chase,” are among his later works, and little known or read. He died in October, 1783, leaving only two survivors of his seventeen children. His dramatic and other works (the novels excepted) were printed in 4 vols. 8vo. 1783. Life prefixed to his works. Gen. Biog.

Brooke, Frances, the daughter of a clergyman, whose name was Moore, and the wife of the Rev. John Brooke, of Norfolk, was distinguished both by her literary talents and the gentleness and fluavity of her manners. Her death, which happened at Sleaford, in Lincolnshire, Sept. 26th 1789, was occasioned by a spasmodic complaint. Her first literary performance was a periodical work, entitled “The Old Maid,” continued from November 15th, 1755, until July 1756, and published in one volume 12mo. In the latter year she published “Virginia,” a tragedy, with odes, pastoral, and translations, 8vo. In 1763, she published her novel, entitled “The History of Lady Julia Mandeville,” which was read with general approbation, although not without a wish that the catastrophe had been less melancholy. In the same year she also published “Letters from Juliet Lady Cateby to her Friend Lady Henrietta Campley,” 12mo; a translation from the French. She soon afterwards accompanied her husband, who was chaplain of the garrison at Quebec, to Canada; and there witnessed those romantic scenes that are so admirably described in her “History of Emily Montague,” 4 vols. 12mo. In the following year appeared “Memoirs of the Marquis of St. Forliex,” 4 vols. 12mo. Soon after her return from Canada, she formed an intimate acquaintance with Mrs. Yates, and had, as some have said, a share with her in the Opera-house. As Mr. Garrick had rejected her first play, which was the tragedy of Virginia, she made a second attempt to obtain his favour, but without success. This conduct, on the part of the manager, excited her resentment, which she expressed with a severity, afterwards lamented and retracted, in a novel, entitled “The Excursion,” and published in 2 vols. 12mo. 1777. Her “Siege of Sinope,” was acted at Covent-Garden, in 1781, and met with temporary approbation, probably from the support that was given to it by the theatrical talents of Mr. Henderson and Mrs. Yates; but her most popular performance was “Rosina,” preferred to Mr. Harris, the manager of Covent-Garden, and acted at that theatre in 1782. Her last work was “Marian,” which appeared in 1788, and was acted with some success, though it was much inferior to her Rosina. She was also the translator of the “Abbe-Millot’s Elements of the History of England, from the Invasion of the Romans to the Reign of George II.” in 4 vols. 12mo. Biog. Dict.

Brookfield, in Geography, one of the most ancient, wealthy, and populous towns of Worcester county, in the state of Massachusetts, situated in the south-western part of the county, and containing 3320 inhabitants; 64 miles W. of Boston, on the post road leading from Boston to New York, and 27 miles W. of Worcester. Its Indian name was “Quaboag.” In the vicinity of this town are iron ore, and large quantities of stone, which yield copperas. It is situated by people from Ipswich, in 1650, and incorporated in 1673. — Also, a township in Orange county, Vermont, including 421 inhabitants; 81 miles northerly from Bennington. — Also, a township of Lincoln county, in the district of Maine, 14 miles above Norridgewalk, on Kennebec river; formerly called “Seven Mile Brook.” — Also, a town in Montgomery county, New York; 160 inhabitants of which are electors by the last census of 1790. — Also, a township in Fairfield county, Connecticut; 6 miles N. E. from Danbury.

Brookhaven, a township in Suffolk county, Long-island, New York, containing 3224 inhabitants, of whom 223 are slaves, and by the last census of 1790, 635 electors. The town includes about 40 houses, together with an episcopal and a presbyterian church; 60 miles E. of New York. Brookline, in Botany. See Veronica Beccabunga.

Brooklyn, in Geography, a pleasant town of America, in Norfolk county and state of Massachusetts, containing about 60 or 70 families; situate between Cambridge and Roxbury, and separated from Bolton on the east by a narrow bay, which
which sets up south from Charles river, and forms a peninsula of Boston. This town supplies Boston with vegetables, and it is the place whither perfons of fortune retire from public life.—Alto, a township in King's county, New York, on the west end of Long Island, containing 1,653 inhabitants, of whom 405 are freemen and 224 are electors, by the last census of 1796. In this place is a presbyterian church, a Dutch reformed church, a powder magazine, and some elegant houses lying chiefly in one street. It is separated from New York by East river, which is nearly a mile broad; and forms an agreeable object from the city.—Alto, a township in Wyandot county, Connecticut, about 20 miles N. of Norwich.

BROOK, in Botany. See GENISTA and SARTORIUM.

BROOM. See ASPALATMUS.

BROOM, African. See RUSCUS ACULEATUS.

BROOM-flower, in Heraldry, the denomination of an order, inlinitated by St. Louis king of France, in the year 1274, on occasion of the coronation of his queen Margaret, eldest daughter of Raymond Berengarius, count of Provence. The habit of the knights was a cloak of white damask, with a violet-coloured hood. The collar was a gold chain of broom-flowers, camellion proper, interlaced with lozenges of gold and flower-de-lis, pendant therefrom, a crescent flore, with this inscription "Exaltat Humiles;" the founder accounting the broom the symbol of humility. Their number was at the sovereign's pleasure, and this order continued till the death of king Charles V.

BROOM-gall, in Entomology. See GALLS of the Broom.

BROOM-isch, or lake, in Geography, an extensive salt-water lake, or arm of the sea, on the north-west side of the county of Ros in Scotland, famous for its excellent herrings. On this lake is the village of Ullapool.

BROOM-rape, in Botany. See OROBANCHE.

BROOM also denotes a well-known household beam, or implement wherewith to sweep away dirt, dust, and the like: thus we say, a birch-broom, a hair-broom, a ruff-broom, a heath-broom. The primitive kind of brooms, from whence the denomination is given to all the rest, was made of the genipa, or wild broom, growing on commons.

BROOM, William, in Biography, a native of Cheshire, was educated upon the foundation at Eton, but failing of a vacancy in a scholarship at King's college, though he was captain of the school for a whole year, he was superannuated, and sent to St. John's college by the assistance of friends, where he obtained a small exhibition. He appeared in the world at an early period as a translatior of the Iliad into prose, in conjunction with O'zell and Oldiworth, a translation, which, though now forgotten, was, in Towne's opinion, superior to that of Pope. After his introduction to Mr. Pope, he was employed by him to make extracts from Enllathus for the notes to the translation of the Iliad; and in Pope's Miscellanies, many of his early pieces were inserted. When the success of the Iliad gave encouragement to a version of the Odyssey, Pope called Fenton and Broome to his assistance; taking half the work upon himself, and assigning the other half to his coadjutors, four books being allotted to Fenton, and eight to Broome. To the lot of Broome fell the 2d, 6th, 8th, 11th, 12th, 16th, 18th, and 23d; together with all the notes. The stipulated pecuniary recompense of Broome was 350l. together with copies amounting to the value of about 500l. more. Fenton, it is said, was to receive 350l. for his four books. This disproportionate distribution of recompense offended Broome, and produced a misunderstanding between him and his employer. He represented Pope as avaricious, and Pope purified him with a vow of hostility. Among other disrespectful reflections in the Dunciad and the Bathos, he reckons Broome among "the parrots who repeat another's words, in such a hoarse odd tone, as makes them seem their own." It is said that they were afterwards reconciled; but they never became friends. Mr. Broome published a miscellany of poems, but never acquired any very high dignity in the church. Whilst he was rector of Sturston in Suffolk, he married a rich widow; and in 1728, on the king's visit to Cambridge, he obtained the title of L.L.D. In 1773, he was presented by the crown to the rectory of Pulham in Norfolk, which he held with Oakley Magna, in Suffolk, given to him by Lord Cornwallis, together with the vicarage of Eye in Suffolk; he then resigned Pulham, and retained the other two preferments. Towards the close of his life, he amused himself with translating odes of Anacreon, which he published in the Gentleman's Magazine, under the name of Chetler. He died at Bath, Nov. 16th 1745, and was buried in the abbey church. Johnson's Lives.

BROOMING, or DREAMING of a fly, the burning off the flitch she has contracted on her sides with flax, reeds, broom, or the like, when she is on a carcass, or on the ground. See CAREENING.

BROONS, in Geography, a town of France, in the department of the Northern coast, and chief place of a canton, in the district of Dinan; 34 leagues S. W. of Dinan. The place contains 2,001, and the canton 11,523 inhabitants; the territory includes 220 kilometres and 10 communes.

BROOTZI, a town of Siberia; 48 miles N. W. of Tomik.

BROOZENKOWA, a town of Poland, in the palatinate of Podolia; 32 miles N. E. of Kamjniec.

BROQUIES, a town of France, in the department of the Aveyron, and district of St. *Afrique, seated on the Tarn; 7 leagues S. of Rhodie.

BROA, a sea-port town on the east coast of Scotland, in the county of Sutherland; near it is a coal-mine, the coals of which are said to take fire on being exposed to the air; here is likewise a quarry of lime-flours, interposed with a variety of shells; 10 miles N. N. E. of Dornock.

BROA, a river of Scotland, which falls through a lake of the same name, in the county of Sutherland, and runs into the sea at the town of Brora.

BROE, a river of Germany, which discharges itself into the Meuse, about a league below Maclricht.

BROS, a royal free town of Transylvania, seated on the Maros; the capital of a tribunal of the same name, in a fertile country, the inhabitants of which distinguish themselves by their skill in agriculture. By an inscription on one of the gates, addressed to the emperor Transjan, it appears to have been a Roman colony.

BROSCHAN, a town of Bohemia, in the circle of Leitmeritz; 4 miles S. of Leitmeritz.

BROSCHI, in Biography. See FARINELLO.

BROSELEY, in Geography, a large, populous village of Shropshire, England, is rendered remarkable from a phenomenon which occurred here at the beginning of the last century. Beneath the surface of the earth is a continued bed of coal, which is dug, and appropriated on the spot to various iron forges, potteries, &c. and great quantities of it are sent to different towns by means of the Severn which divides this parth from Colebrookdale. In the year 1771, it was discovered that a vapour which arose from a well or pit, would take fire upon being condensed in a tube, and ignited by flame. This circumstance excited great curiosity, and many persons came from different parts of the country to witness the burning well, as it was called. A gentleman...
wrote an account of it for the Philosophical Transactions, and further particulars were published in the Gentleman's Magazine, vol. xxv. p. 393. It continued to burn for some time, till the proprietor of the land having sunk a coal pit in the immediate vicinity, thereby destroyed the operating cause. The parish of Brocoly contains 1041 houses, and 4887 inhabitants. It is 146 miles N. W. from London.

Sp. 1. B. Aicastrum. Brown. Jam. "Leaves ovate, lanceolate, perennial; aments solitary; fruit corticofe." A tree making about one-third part of the woods in some parts of Jamaica. Its wood is not despircable, and its leaves and younger branches are a fattening food for all sorts of cattle. Its fruit, when roasted, eats like a chestnut, and is called bread-nut; and when boiled with salt-fish, pork, beef, or pickle, is a wholesome and not unpleasent food. Its leaves and younger branches are full of gum, which renders them disagreeable to cattle at first, but of which they soon become fond. 2. B. furiun. Brown. Jam. "Leaves lanceolato-ovate, acuminate; aments ovate, in pairs; fruit soft." A timber tree in Jamaica, called milkwood, but not much valued.

Offs. Swartz's description of the germ and fruit is very obscure; that given by Bofc, though not easily reconciled with it, is more intelligible. "Flowers united in a globular ament, composed of petiata scales, each of which, in the barren plants, covers a flamen, and in the fertile ones, a germ with a bilf yffle, without either calyx or corolla." Fruit a one-seedled drupe.

BROSME, in Ichthyology, a species of Gadus, that inhabits the southern seas of Greeneland. The mouth is bearded; tail oval, and pointed. Müll.

Brosme is also a synonymous name of coryphaena rufifinis.

Egede Green. BROSNA, in Geography, a river of Ireland, which issues from Lough-Holy in the county of Weftmeath, and soon after passes through Lough Ennen; on leaving which it runs southward into the King's county, and joins the Shannon, about three miles above Banagher.

BROSNA, Little, a river which forms, for many miles, the southern boundary of the King's county, and flows into the Shannon, about four miles below Banagher.

BROSSAC, a town of France, in the department of the Charente, and chief place of a canton, in the district of Barbezies; 10 miles S.S.E. of Barbezieux. The place contains 1077, and the canton 4887 inhabitants; the territory comprehends 150 kilometres, and 12 communes.

Sp. B. cocinea. Linn. "Shrubby, with a scarlet flower and black fruit." Plum. A shrub three or four feet high. Root branched; leaves alternate, petioted, sharply ovate, slightly toothed, smooth, pale green; flowers in racemes at the end of the branches, alternate, peduncled, with two bracts about the middle of the peduncles.

BROSSARD, in Biography, practised surgery many years at Chartre, in the early part of the last century. He had the merit of reviving the practice of using agaric in stopping hemorrhages, after amputations, which had been discontinued. Though that fungus does not possess the powers he attributed to it, and must not be depended on, in stopping the bleeding of large vessels, yet in preventing the effusion of blood, from the smaller arteries, it is of acknowledged utility. He was rewarded by Lewis XV., with a pension, for divulging the secret, in a short memoir, published on the subjeg, in 1757. Haller. Bib. Chirur. Eloy. Diet. Hilt.

Brossard, Sebastian, author of the first musical dictionary published in a modern language, and which has been of singular use to subsequent musical lexicographers, particularly to Grafelmeau, and Jean Jaques Roufeau. Indeed musical historians would be ungrateful not to acknowledge, that the numerous list of writers on the subject of music, ancient and modern, whence he drew his materials, and which he has inserted at the end of his work, has not opened to them subjegs of inquiry, and sources of information. And we think with M. Framer, that Roufeau has treated this intelligent and zealous writer unworthyly, in accusing him of publishing an Italian dictionary, with a French title. When the second edition of Brofard was published in 1702, the French musical technica was insufficient, alone, to furnish a book; nor could their explanation be much wanted, while taken from the current language of the country. Brofard must be allowed to have marked out the road for Roufeau to pursue, which, with his impressive eloquence, he has certainly rendered more flowery and pleasant.

Honest Walther, in 1732, has been more just to his prototype in his German musical lexicon; where there is a greater extent of musical information than in any book of the fize that we have met with.

The French biographes inform us that Brofard, born 1663, was a canon of the cathedral of Meaux, who excelled in knowledge of the theory of music. The writings which he published on the subjeg were all well received; particularly a musical dictionary, which was of great service to J. J. Roufeau, in furnishing him with the greatest part of the materials for his musical articles in the Encyclopedie, which he afterwards collected, and formed into a volume.

Mr. Grafelmeau might, without excessive humility, have called his musical dictionary a translafion. We know the pains,
pains, experience, and perseverance necessary to collect and read each a number of books in all languages, few of which are either amusing or instructive, to which the first compiler of a dictionary or a history is condemned. Johnson calls our language a "multiform and chaotic dialect," and the technical language of music certainly merits these titles more than the terms of any other art or science. Brodard died in 1730, at 70.

BROSSE, Guy de la, great uncle to the celebrated statesman M. Fagon, was born at Rouen, towards the end of the sixteenth century. Being much attached to botany, he gave a piece of ground, in which the rudiments of the jardin royal des plantes medicinales, at Paris, was laid. This was, after much solicitation, enlarged, endowed, and an establishment for the improvement of botany formed, by cardinal Richelieu, and de Brose was appointed physician to the king, Lewis XIIII, and curator of the garden. This was about the year 1626. He had been twelve years soliciting the establishment, and seems to have spent the remainder of his life, which was extended to the year 1641, in improving it. His works, which all relate to his favourite subject, are: "De l'Etat du Jardin Royal pour la Culture des Plantes Medicinales, a Paris, avec l'Edit du Roy touchant l'Etablissement de ce Jardin en 1626." 8vo. "De la Nature, Vertu et Utilité des Plantes, et Deffien du Jardin Royal de Medicine, Paris, 1628." This was afterwards,viz. in 1640, published in folio, with 35 plates, which are much commended. "Description du Jardin, &c. contenant la Catalogue des Plantes, et le Plan du Jardin, 1636." Haller. Bib. Botan. Elov. Dict. Hist.

BROSSE, or De Broche, Peter la, was born at a town in Touraine, and educated to the practice of surgery, in which he acquired so much celebrity, as to be called to attend Philipill of France; to whom, by his artful management, he made himself so useful, that he made him his chamberlain, and entrusted to him the government of the kingdom. Elated with this extraordinary success, he became insolent to the peers, none of whom could get access to the king but through him. Finding the queen was become his enemy, as well as most of the principal personages in the kingdom, with the view of ruining her with the king, he took the horrid resolution of poisoning prince Lewis, the eldest son of the king, by his former queen. This he effected in the year 1726, and then accosted the queen of having committed the murder, in order to raise her son to the throne; but the villainy of the man was discovered by the means, it is said, of a nun; and he was executed, to the great joy of the country. The story is told by Henault, in his Abrigé Chronologique de l'Histoir de France.

BROSSES, Charles de, an eminent mathematician, and man of letters, was born at Dijon in 1709; and pursuading the line of profession for which his family had been distinguished, he became a counsellor of parliament in 1730, and a president à mortier in 1741. As he was eminent for his zeal and integrity, as well as for his talents, he was entrusted with the conduct of many interesting transactions, and in consequence of preventing the remonstrances of the people to the throne, he shared the honourable disgrace incurred by many other worthy persons in the reign of Lewis XV. However, he afterwards obtained distinguishing marks of court approbation, by being appointed president of the parliament of Burgundy in 1774. His intervals of leisure were devoted to the pursuits of literature and science; and in these his range was so extensive as to comprehend history, geography, mythology, antiquities, metaphysics, and languages. He was also acquainted with a great number of learned men, both at home and abroad; and was a member of various literary societies. Buffon had been his school-fellow, and regarded him from his youth as a genius of a superior order. Besides being the author of several memoirs in the collections of the academies of Paris and Dijon, the Journal des Scavans, and the Dictionnaire Encyclopédique, he wrote the following separate works: "Letters on the Discovery of Hercules, &c," 1720, 8vo.; "History of Voyages to the Southern Regions," 2 vols. 1759; in which he maintains the existence of a southern continent, disproved by the subsequent voyages of the French and English, at least within any accedible latitudes: "On the Worship of Fetiches, or a Parallel between Ancient Idolatrie and that of the People of Negroland," 1760, 12mo.; a curious philosophical and mythological performance: "Tentative on the mechanical Formation of Languages," 2 vols. 1765; in which he attempts to establish a general etymological system, deduced from the supposition of a primitive language, founded on the mechanical formation of articulate sounds: "History of the Roman Republic in the Course of the seventh Age of Rome, by Sallust, partly translated from the Original of that Author, and partly composited and restored from the scattered Fragments of his Halt Works," 3 vols. 1777; and "Letters Historiques et Critiques sur l'Italie," &c. 5 vols. 8vo. Paris, 1799. In private and social life he was no less amiable than respectable in his public and literary character. He died at Paris, May 7, 1777. Eloge par M. Murct. Nouv. Dict. Hist.

BROSSETTE, Claude de, was born at Lyons in 1671, first entered among the Jesuits, and afterwards became a lawyer. He was a member of the academy of Lyons, and keeper of the public library in that city. His works besides some professional performances, were "A Brief History of the Town of Lyons," and "A New Historical Enquiry of the Town of Lyons," 4to. 1711, both elegantly written; "Historical Elucidations of the Satires, and other Works of Boileau Delpérreaux," 2 vols. 1705, often reprinted in various sizes; and "A Commentary on the Satires and other Works of Rognier," 8vo. 1729. Brockett corresponded with several literary persons, particularly with Rousset and Voltaire. He died at Lyons in 1736. Nouv. Dict. Hist.

BROTHET, in Ichthyology, one of the French synonyms of the garfish or sea-pike. See Esox Lucius

BROTERA, in Botany, a genus in the class monaldelphio dodecaecia, formed by Cavanilles for a plant found in New Spain, which differs from his genus Dombeya, only in the structure of the capsule: but, as Bois observes, it agrees in generic character, and ought to be united with Pentapetes Phenicea, the only species for which Willdenow has preserved that Linnean genus, the other two original species having been separated from it to form a new genus, which from their winged seeds is called Pteropterpermum. La Marck not thinking the difference in the structure of the capsule sufficient to make a distinct genus, has abolished the genus Dombeya of Cavanilles, Julicini, Ventenat and Willdenow, and has placed all its species under the genus Pentapes, with the original Pentapetes Phenicea, still retaining Pteropterpermum as a distinct genus. See Pentapetes, where the Brotera of Cavanilles will be described.

BROTEROD, in Geography, a town of Germany, in the circle of Franconia, and county of Hamburg, belonging to the landgrave of Hesse Cakel; 5 miles N. of Schmalkalden.

BROTHEL. See Bawdy-bouye and Stews.

BROTHER, Prater, a term of relation between two male children, sprung from the same father or mother, or both. Scaliger and Vossius derive frater from frater, for frater, which properly signifies a person who draws water in
the same well; ἡγέω, in Greek, signifying well, and ἡγείμον, a company of people, who have a right to draw water out of the same well.—The word, it is said, came originally from the city Argos, where there were only a few wells distributed in certain quarters of the city, to which those of the same neighbourhood alone repaired.

By the civil law, brothers and sisters stand in the second degree of consanguinity; by the canon law, they are in the first degree. By the Mosaic law, the brother of a man who died without issue, was obliged to marry the widow of the deceased. Deuter. xxv. 7. See Levirate.

The ancients applied the term brother indifferently to almost all who stood related in the collateral line, as uncles and nephews, cousin-germans, &c.—This we learn not only from a great many passages in the Old Testament, but also from profane authors: Cicero, in his Philippius, says, "Antonia was both wife and father of Mark Antony; because she was daughter of his brother C. Antonius." And as to cousins, Tullius Pohilius, in Dionysius Halicarnassius, calls the Horatii and Curatii, brothers; because they were children.

The language of the Jews, bishop Pearson observes, included in the same brethren not only the strict relation of fraternity, but also the larger of consanguinity. We are brethren, says Abraham to Lot, Gen. xiii. 8. whereas Lot was only his nephew.—So Jacob told Rachel that he was her father's brother, Gen. xxix. 12. whereas he was her father's nephew.—This consideration has been urged with good advantage against the Antidicomarianites, who, from the mention made of the "brothers of Jesus," (Johni. 12. Matth. xii. 46.) have impugned the perpetual virginity of the mother of Christ, for which, however, there seems to be no sufficient foundation.

Among us, it is customary for kings to give the title "brother" to each other; the union in coronation being esteemed to create a kind of "brotherhood." Nor is the custom modern: Menander mentions a letter of Cofroes, king of Persia, to the emperor Julianian, beginning thus: Cofroes, king of kings, &c. to the emperor Julianian "my brother."

Kings now also give the same appellation to the electors of the empire; and the like was given, by the king of France, to the king of Sardinia, while only duke of Savoy.

In the civil law, brothers, fratres, in the plural, sometimes comprehend sisters: as Lucius and Titius, fratres; tres fratres, Titius, Maxius, et Seca.

Brothers, fother, thoe which sucked the same nurfe. The French call them "fratres du lait," or brothers by milk; which is most properly used in respect of a person who sucked a nurfe at the same time with the nurfe's own child.

Brothers, German, Fratres Germani. See German.

Brother was also used, in Middle Age Writers, for a comes, or governor of a province.

Brother is applied, in a lef proper sense, to denote a person of the same profession. In which sense, judges, bishops, priests, &c. call each other brothers.

Brother in Christ, frater in Christo, the same with spiritual brother, a person admitted into a monastic society or fraternity.

Brother is more particularly used to denote the relation between monks of the same convent: as brother Zachary, brother Bonaventure, &c. In English, we more usually say, friar Zachary, &c. from the French word frere, brother.

This appellation is borrowed from the primitive Christians, who all called each other "brothers;" but it is principally used for such of the religious as are not priests; those in orders are generally honoured with the title of fathers, patres, pares; whereas the rest are only simply brothers.

The monks of St. Dominic are particularly called preaching brothers, or friars predicae: those of St. Francis, minor brothers; those of charity, ignorant brothers, &c. Confraternity brothers, fratres confratuum, denote laymen and others entered in the catalogue of the brothers of a monastery, or rather pseudo of the fraternity thereof. Outer brother, frater exterior, sometimes denotes a lay-brother. Strange brother, frater adventus, a holt or guest belonging to another monastery. Foreign brothers, frater externus, either a monk, priest, or canon of some other monastery, to whom the prayers of the society are granted. Mature brother, frater maturus, one distinguished by his age, gravity, or probity, above the rest.

Brothers, spiritual, denote laymen admitted into a monastic fraternity. The name was also given to those other-cisle wife to those adopted brothers, and sometimes also to a sort of adopted brothers, or persons who commenced a kind of brotherhood, with the ceremony of breaking bread together, in the church before the priest.

Brother, lay, frater laicus, or conversus. See Lay Brother.

Brother, given, frater donatus, among the Carthusians, denotes a young person drest in minim cloth, and wearing a hat, whose office is to serve in the house, answering to what in other orders is called an offered brother, frater oblatu.

Brother is also an appellation more peculiarly given to certain orders of religious: thus the

Brothers of St. Alexis, in the Low Countries, were an order of persons who attended on those who lay dying, and took care of the burial of the dead.

Brothers of Ave Maria. See Servites.

Brothers of Charity, a fort of religious Hospitallers, founded about the year 1297, since denominated Billettes. They took the third order of St. Francis, and the cloaculary, making three usual vows, but without begging.

Brothers of Charity, also denote an order of Hospitallers still subsisting in Romish countries, whose business is to attend the sick poor, and minister to them both spiritual and temporal succour. They are all laymen, except a few priests, for administerting the sacrament to the sick in their hospitals. The Brothers of Charity usually cultivate botany, pharmacy, surgery, and chemistry, which they practice with success.

They were first founded at Granada, by St. John de Dieu; and a second establishment was made at Madrid, in the year 1553: the order was confirmed by Gregory XIII. in 1572. Gregory XIV. forbade them to take holy orders: but by leave of Paul V. in 1609 a few of the brothers might be admitted to orders. In 1619 they were exempted from the jurisdiction of the bishop. Those of Spain are separated from the rest, and they, as well as the brothers of France, Germany, Poland, and Italy, have their distinct general, who reside at Rome. They were first introduced into France by Mary of Medicis, in 1601, and have since built a fine hospital in the Faubourg St. Germain.

Brothers of Charity of St. Hippolytus, a religious congregation first set on foot by Alvarez, a citizen of Mexico, in 1585, who associated with him several other persons to attend on the sick, and founded an hospital without the walls of that city; which being approved of by the pope, and the number of like hospitals increasing, a congregation was formed under the title of "The Charity of St. Hippolytus,"
BRO

lytus," because the first hospital had been dedicated to that saint, on whose feast-day the city first fell into the hands of the Chriftians. Clement VIII. in 1594, granted them all the privileges of the Brothers of the Charity of St. John de Dieu.

Brothers of Death, a denomination usually given to the religious of the order of St. Paul, the first hermit. They are called "Brothers of Death," fratres mortis, on account of the figure of a death's head, which they were always to have with them, in order to keep perpetually in their minds the thoughts of death. This order, by its con-
stitutions, made in 1650, does not seem to have been esta-
blished long before pope Paul V. Lewis XIII. in 1621, permitted them to settle in France. It was probably sup-
prefed by pope Urban VIII.

Brothers of Penitence, or of the Penitence of Jesus Christ, a name given at Tholouse to the religious of the third order of St. Francis; called also Beguini; and to a fra-
ternity of Penitents held in the chapel of the church of the third order, under the direction of the Beguini. See Beguini.

Brothers, Pyal, fratres pia, a denomination given to all monks, whose habit was partly white, partly black; they were otherwise called Agachers.

Brothers of St. Gregory the Illuminator, a religious order established in Armenia, in the fourteenth century, which being much reduced and decayed by the conquests of the Turks and Persians, was, in 1556, united to the order of St. Dominic.

Brothers, Joyful, fratres gaudentes, in Italy, denote the knights of the order of the Virgin Mary, first instituted at Bologna in 1261, for whom a rule was prefixed by pope Urban IV.

Brothers, poor, in the Charter-houfe, a denomination given to decayed gentlemen, to the number of eighty, who are habited with diet, cloathing, and lodging on the establish-
ment. The poor brothers are to be gentlemen by descent, re-
duced to poverty, or decayed merchants, fouldiers, or officers of the king's household. The conditions of admission are
that they have no estate for life worth 200l. nor coming in
vis & modis, 24l. per annum; and that they be fifty years
old, unless they have been maimed in the public service; in
which cafe, the age of forty suffices. They wear a livery-
gown within doors.

Brothers, White, the name of a fe& which appeared in
Rufia towards the beginning of the fourteenth century; so
called from their white cloaks, on which was a St. Andrew's
cros of a green colour. See Brethren.

Brothers of Arms, an appellation given to those who con-
tract a kind of fraternity in war, obliging themselves to the mutual service and afiainance of each other. In the mil-
tary orders, the knights are also called brothers.—In the
order of Malta, there is a particular class, who are called "serving brothers;" confining of such as cannot give proof of
their nobility. In Latin they are denominated fratres clien-
tes.

Brothers by adoption. See Adoption.

Two brothers who have only the same father, are called
fratres confugiunti; and those who are only defended from
the same mother, fratres uteri.

Brothers of the Cross. See Flagellantes.

Brothers of the rosy cross. See Rosycrusians.

Brothers, suorum, fratres conjurati. See Fratres.

Brothers, in Alchemy, larm, or maimed, denote the im-
perfect metals, which are to be cured of their lameness by the
perfect elixir; i.e. are to be purified and separated from their
droes, &c. by the philosopher's stone.

Brothers, in Geography, islands in the Indian sea, on the
north side of the entrance into the straits of Malacca. N. lat.
7° 18'. E. long. 78° 10', to 78° 14'.

Brothers, Seven, islands in the Indian sea. S. lat. 3° 24'.
E. long. 60° 25'.

Brothers, Three, islands in the Indian sea. S. lat. 3°
45'. E. long. 65° 25'.—Alfo, islands in the East Indian sea.
N. lat. 10° 32'. E. long. 107° 56'.—Alfo, islands in the fame
sea. S. lat. 5° 20'. E. long. 157° 30'. The moft northerly,
which is about 5 or 6 leagues somewhat southerly from
Thumb hool, is called by the Dutch "North Brother." Be-
tween thefe and Celebes, lies Tonakkee ifland, which is
larger than any of them.—It is three remarkable islands on
the caft coast of New Holland, which may be feen 14 or 16
leagues off at fea. S. lat. 31° 40'. W. long. 207° 10'.

Brothers, Two, lie on the caft coast of New Holland,
off cape Manifold; one of them is low and flat, and the
other high and round; near the shore is a third island.—
Alfo two iflands of New Zealand, near queen Charlotte's
found.

BROTHERHOOD. See Fraternity.

BROTHERHOOD of God, in the Middle Ages, a denomina-
tion given to an afcription formed for refraining and aboli-
ishing the right and exercice of private war. The people,
eager to obtain relief from the fufferings that were thus oc-
casioned, among other expedients, had recourse to a pre-
dated revelation. Towards the end of the 11th century, a
carpenter in Guiney gave out, that Jesus Christ, together
with the blessed Virgin, had appeared to him, and having
commanded him to exhort mankind to peace, had given him,
as a proof of his mission, an image of the Virgin holding her
fon in her arms, with this inscription: "Lamb of God, who
takes away the fins of the world, give us peace." This low
fanatic addressed himself to an ignorant age, prone to credit
what was marvellous. He was received as an inspired me-
senger of God. Many prelates and barons assembled at
Pyu, and took an oath, not only to make peace with all their
own enemies, but to attack such as refused to lay down their
arms, and to be reconciled to their enemies. Thus they
formed the above-mentioned afcription. But the influence
of this superflitious terror or devotion was not of long con-
tinuance.

BROTHERTON, in Geography, an Indian village of
North America, adjoining New Stockbridge in the state of
New York, inhabited by about 150 Indians, who migrated
from different parts of Connecticut, under the care of the Rev.
Mr. Occom. These Indians receive an annuity of 2160 dol-
ars, which sum is partly appropriated to the purpose of main-
taining a school, and partly to compensate a superintendent
for transacting their business, and disposing of the remainder
of their money for their benefit.

BROTIER, Gabriel, Abbe, in Biography, a distin-
guifhed scholar, and member of the French Academy of
Belles Lettres, was born at Tonny in the NiVerneux, in
1723, and educated in the Jefuits' college of Louis-le-Grand, of
which he was for several years librarian. Acquainted
through life to write notes in the margins of all the books
which he read, and distinguished also by a retentive memory
and angular penetration, he had thus collected materials for
several volumes; and as he applied to study for 10 or 12 hours
da day, he had acquired an immense fund and variety of
knowledge. With the exception of the mathematics, his
knowledge comprehended every branch of science, natural
history, chemistry, and even medicine. It was his custom
every year to read Hippocrates, and the books of Solomon,
in the original languages; for these, he said, were the best
remedies for all bodily and mental diseases. But he was
principally
principally devoted to the belles lettres: and had acquired an accurate acquaintance with all the dead languages, particularly the Latin, and with most of the modern languages of Europe. He was also well versed in ancient and modern history, chronology, coins, medals, inscriptions, and the usages of antiquity; and he had collected a great mass of materials for a new history of France, which he was prevented from undertaking. On the dissolution of the order of Jefuits, he found a pleasant asylum in the house of M. de la Tour, an eminent printer, and in this retreat he spent the last 20 years of his life. Here he published his edition of Tacitus, enriched with notes and learned dissertations, and supplements: and also a new edition of Pliny the Naturalist, to which he has added notes and illustrations, being merely a concise abridgment of what he had prepared with a view of correcting and enlarging the edition of Har- douin, and of giving an historical account of all the new discoveries made since the beginning of the 18th century. His other works of inferior importance were a beautiful edition of Plutarch; an edition of Rapin's poem, De Hortis; to which he subjoined a History of Gardens, written in Latin with great elegance, and abounding in the most beautiful imagery. Beside a lively imagination, Broter possessed a sound and discriminating judgment, and an elegant taste. His compositions were clear, and his mode of communicating knowledge admirable. From the abbe Fontenay's further delineation of his character, we shall select the following particulars. 'Humble and unassuming, and of such delicate modesty as cau- sed him to blush when the least encomium was passed upon him; good-tempered, plain in his manners, and giving himself up to society with the smiles and sim- plicity of a child; his conversation was engaging, and always instructive when it turned on subjects of literature and science. Widely differing in this respect from those men of letters, who, if we may be allowed the expression, are masters of their knowledge, and seem to hoard it up for themselves, or that they may make an ostentatious display of it in some publication, the abbe Broter answered with great readiness the questions of every person who applied to him for information, and instructed those around him with the utmost affability and condescension.' 'That intimate friendship which united me to the abbe Broter,' says Fontenay, 'gratitude for the services he did me, his talents, and his virtues, will always endear his memory to me; and I may justly say with the Roman poet, 'Mutis ille bonus flebiles occidit, Nulli sibiulor quam mili.'

This accomplished and elegant scholar died at Paris, Feb. 1768, at the age of 67. The following is a list of the abbe Broter's works, as given in La France Litteraire, by J. S. Etrich, published at Hamburgh in 1795, and cited in Akin's General Biography: 'Examen de l'apologie de M. l'Abbe de Prades,' 1757, 8vo; 'Conclusiones ex universa Theologia,' 1754, 4to; 'Traite des monnaies Romaines, Grecques, et Hebr. comparées avec les monnoies de France, pour l'intelligence de l'Escriture Sainte et de tous les auteurs Grecs et Ro- main,' 1760, 4to; 'Prospect us d'une edit. Lat. de Ta- cite, en 5 vols. 4to,' 1751; 'C. Corn. Taciti Opera, recog- nitae, emend. suppl. explevit, notis, differt. tabulis geogr. illustravit,' 1771, 4 vols. 4to; 'Supplementa, lib. 7, 10 Annal. Taciti,' 1757, 8vo; 'Cl. viri de la Vite vita,' 1763, 4to; 'C. Plini Historia naturalis,' 1779, 6 vols. 12mo; 'Renati Rapini Hortorum, lib. iv. et cultura horti- tulorum, historiam hortorum addidit,' 1778, 8vo; 'Phadri Fabularum, lib. v. cum notis et suppl. accedit. Parallelle J. de la Fontaine Fabulz,' 1785, 12mo. A. C. Broter, the ab-
of a friend at Tottenham High Cross, where he died of a pulmonary consumption in August, 1613. His funeral was attended by a great concourse of friends; and his remains were interred in St. Antholin’s church-yard. As a scholar, and controversial divine, Mr. Broughton was self-opinionated, choleric, rude, and dogmatical; but for the heinous charge of ingratitude to his first friend and patron, Bernard Gilpin, against whom he is said to have incensed the bishop of Durham, there seems to be no sufficient foundation. His works are for the most part printed together in one large folio volume, at London, in 1602, with this singular title, “The Works of the great Albionian Divine, renowned in every nation for great skill in Salem’s and Athens’ tongue, and familiar acquaintance with all rabbinical learning, Mr. Hugh Broughton.” Dr. Lightfoot, addicted to similar kind of literature, highly extols them; but they are now forgotten. During his life, Broughton was not only a subject of angry controversy, but of ridicule; an instance of which occurs in Ben Johnson’s “Alcyoniad.” But this contemptuous reflection was more than counterbalanced by an elegy, polishing great poetical beauties, written by an obscure author, called “W. Primrose,” and annexed to his works. In this elegy, theology is personified, and represented as lamenting the loss of him. What he says of him as a linguist, is as follows:

“Who, tuneful as the silver-pin’d swan,
Canaan’s rich language in perfection sang,”

“_He knew the Greek, plentiful in words and sense,
The Chaldee wife, the Arabic profound,
The Latin pleasing with its eloquence,
The braving Spaniard with its lofty found,
The Tuscan grave with many a laurel crown’d,
The lifting French, that fits a lady vain,
The German, like the people, rough and plain,
The English, full and rich, his native country’s strain._”

Biog. Brit.

Broughton, Thomas, a learned episcopal divine, and one of the first writers in the Biographia Britannica, was born in London, July 5, 1704, educated at Eton, and removed to Cambridge about the year 1722, where he entered himself of Gonville and Caius college. At school he had distinguished himself by the acuteness of his genius, and the fluency of his disposition; and at the university he directed his chief attention to the modern languages, and to the mathematics, which he studied under the famous professor Saunderson. In 1727, he took both deacon’s and priest’s orders, and left the university, to supply the vacancy of Offley in Hertfordshire. In 1739, he was presented to the rectory of Steptingdon or Sibbiington in the county of Huntingdon; and soon after he was chosen reader to the Temple, and thus introduced to an acquaintance with bishop Sherlock, who, in 1744, preferred him to the valuable vicarage of Bedminister, near Brilfol, together with the annexed chapels of St. Mary Redcliffe, St. Thomas, and Abbot’s Leigh. Upon receiving this presentation, he removed to Bridglov, where he married a wife, by whom he had seven children, of whom six survive him. He resided on his living till his death, which happened Dec. 21st 1774; and his remains were interred in the church of St. Mary Redcliffe.

Mr. Broughton, during his residence in London, associated with the principal literary men of his time; and as he was a great lover of music, he was introduced to the acquaintance of Mr. Handel, whom he furnished with the words for many of his compositions. In his public character he united moderation of temper with a zealous attachment to the churitian cause; and in his private life, his disposition was mild, cheerful, and liberal, and he devoted his time and attention
attention to the interests and happiness of his family. From
the time of his quitting the university till he was consider-
ably advanced in life, he engaged in a variety of publica-
tions, of which the following list is taken from a paper in
his own handwriting: "Christiandit from the Reli-
gion of Nature, in three parts, in answer to Christiandit
as old as the Creation; "Translation of Voltaire's Temple
of Potte; "Preface to his Father's Letters to a Roman
Catholic; "Alteration of Dorrel on the Epistles and
Gospels, from a Papish to a Tractastant Book," 2 vols.
Part of the new Edition of Bayle's Dictionary in English,
corrected, with a Translation of the Latin, and other
Quotations; " Jarvis's Don Quixote, the Language
thoroughly altered and corrected, and the poetical parts
translated; "Translation of the motes of the Spectator,
Guardian, and Freetholder; "Original Poems and Tran-
lations by John Dryden esq., now first collected and
published together, 2 vols." "Translations of the quotations
in Addison's Travels, by him left untranslated; " the first
and third Oliphantes, and the four Philiippi of Democ-
thenes (by several hands), revised and corrected, with a new
Translation of the fourth Oliphantes, the Oration de Pace,
and the de Cherfonese, to which are added all the
Arguments of Libanius, and select notes from Ulpian," Svo.;
" Lives in the Biog. Brit. ", "The Bishops of Lon-
dond, and Winchester on the Sacrament, compared; " Her-
cules, a Musical Drama; " a Bibliotheca historico-facra, an
historical Dictionary of all Religions from the Creation of
the World to the present time," 1756, 2 vols. folio, " A
Defence of the commonly received Doctrine of the human
Soul," and " A Prospect of Futurity, in 4 Dissertations,
with a preliminary Discourse of the natural and moral
Evidence of a future State." He also left in manuscript,
"A short View of the Principles upon which Christia-
Churches require of their respective Clergy, Subscription
to established Articles of Religion," which was composed
not long before his death. From several fugitive pieces found
in manuscript among his papers, and two unfinished tragedies
written at the age of 17, it is inferred that he possessed

BROCKTON ISLAND, in Geography, an island of America,
lying at the mouth of Alphabeta river in Georgia, which
belonged to the late Henry Laurens, esq. The fourth chan-
el, after its separation from the north, defends gently,
wing by McIntosh and Broughton islands, in its way to
the ocean through St. Simon's sound.

BROCKHUSIUS, in Biography. See BROCKHUSF.

BROUCKNER, or BROUSNER, WILLIAM, lord count
of Caste Lyons in Ireland, and first president of the Royal
Society after its incorporation, was the son of Sir William
Brouner, made viscount in 1645, and born about the year
1620. At an early period he manifested a genius for those
mathematical sciences, in which he afterwards excelled.
The place and course of his education are not known;
but in June, 1646, he was created doctor of physic at
Oxford; and in 1657 and 1658, he corresponded on math-
ematical subjects with Dr. John Wallis, who published his
letters in the " Commerium epistolicum," printed at Ox-
ford in 1658, 4to. In April 1663, he united with the
nobility and gentry in subscribing a declaration, acknow-
ledging general Monk to be the restorer of the laws and
privileges of these nations. After the restoration, he was
made chancellor to queen Catharine, and keeper of her great
seal, a commissioneer of the admiralty, and master of St.
Catharine's hospital near the tower of London. He was
also an active and useful member of the Royal Society at its
first establishment, and held the office of president with
honour to himself, and advantage to the institution, for 15
years, viz. from July 1663 till November 1677. Of his
works, notwithstanding his activity in promoting literature
and science, there are few extant. These are "Experiments
on the recovering of Guns," published in Dr. Spratt's History
of the Royal Society; "An algebraical Paper upon the
squaring of the Hyperbola," published in the Philosophical
Transactions (See Lowthorp's Abr. vol. i. p. 198, &c.);
"Several Letters to Dr. James Uther, archbishop of Ar-
magh," annexed to that private's life by Dr. Parr; and
"A Translation of the Treatise of Des Cartes, entitled
"Methods Compendium," published without his name, but en-
crised with a variety of observations, which flew that he
was deeply skilled in the theory of the science of music.

Lord Brounker died at his house in St. James's street,
Wellminton, April 5, 1684, and was buried in a vault in
the middle of the choir belonging to the hospital of St.

BROUSONETRA, in Botany. See PAPIRUS.

BROUSSE, in Geography, a town of France, in the
department of Puy le Dôme; 6 leagues E. of Clermont.

BROUSSON, CLAUDE, in Biography, a French pro-
testant, who was a zealous partisan, and at length a
martyr of the reformed religion, was born at Nimes in 1647,
and educated to the law. He exercised the profession of an
advocate for 20 years, first at Caftres and afterwards at
Touloufe, with singular reputation for generosity and dif-
interestedness, as well as firmness and ability. As he took
part in his pleadings with the protestant minister and
churches, an attempt was made to corrupt his integrity by
the office of a counsellor's place, which he rejected with
contempt. It was at his house that the deputies of the
protestant churches assembled in 1683, and here they con-
curred in the resolution of continuing to assemble for
public worship though their churches were demolished.
The execution of this purpose was productive of many
mutuals, editions, and massacres; and though they were
terminated by an amicable issue from the court of Louis
XIV., this was accompanied by an order for arresting seven or
eight persons, who had been principally concerned in framing
the resolution. Brouson was one of these; and appre-
ching the consequence, he had previously retired to
Nimes; and as soon as he received the intelligence of the pro-
posed arrest, he fled to Geneva, and afterwards to Lautanne.
At this latter place he published his "State of the Reformed in
France," 1684; and his "Letters to the French Clergy in faviour of
the Reformed Religion," 1685. About this time he was appointed one of the deputies from
the principal refugees in Switzerland, for engaging
the protestant powers to interest themselves in favour of the
French reformed that were dispersed through Europe.
At Berlin, he composed, by desir of the elector of Bran-
denburg, his "Letters from the Protestants in France to all
other Protestants." From Berlin he went to Holland,
and had several conferences with the prince of Orange and
pensioner Fagel. Afterwards returning to Switzerland,
he printed "Letters to the Roman Catholics;" and, with
a view to the more effectual distribution of them in France,
he ventured, in 1689, to visit that country. On his arrival
in the Cevennes, he accepted the office of minister to a
congregation of protestants, which assembled on the top of a
high mountain, and, notwithstanding the various prosecu-
tions with which he encountered, he continued the exercise
of his ministrual functions in these parts for 4 years. In
1686, he returned to Lautanne, and from thence removed to
Holland, where he printed "A summary Relation of the
Wonders wrought by God in the Cevennes and Lower
Languedoc,
Langsdor, for the confutation and instruction of his defolated Church, to which his enemies would naturally ascribe the character of fanaticism. He also published a volume of sermons, and received from the States of Holland a pension, as a minister. Towards the close of the year 1765, he again visited France, travelling through most of its provinces and employing his pen in various writings. During the negotiation for the peace of Ryswick, he exerted himself in exciting the protestant powers to treat for the re-establishment of the French reformed churches. Failing of success in this object, he made another tour through France, and, after encountering a variety of hazards, he was at length apprehended at Oleron in September, 1768, and carried for trial to Montpellier. Having been convicted of preaching in defiance of the royal edict, and of having held correspondence with the enemies of the state, he was condemned to be broken alive upon the wheel, and he endured the execution of this dreadful sentence with all the firmness appropriate to his character. His eloquence and zeal were universally acknowledged, and by his own party he was regarded as a martyr. The States of Holland did him honour to memory, by adding 600 florins, as a pension to his widow, to the 400 which had been allowed to himself. Nov. Dict. Hill.

BRUEVILLEURS, in Geography, a town of France, in the department of the Volges, and chief place of a canton, in the district of St. Die; one league N. of Brives. The place contains 444, and the canton 3574 inhabitants; the territory comprehends 130 kilometres and 10 communes.

BRUWER, in Biography. See Brouwer.

BRUZET, NICHOLAS, was born in the neighbourhood of Montpellier, where he took his degree of doctor in medicine, in the year 1756, whence he went to Paris, and was admitted corresponding member of the Royal Academy of Sciences, and soon after was made physician to the hospital at Fontainbleau. He published in 1754, "Elia sur l'Education medicinale des Enfans, et fur leurs Maladies," a popular work, by which he obtained much credit. In his chapter on Generation, he follows the system of Buffon, and supposes the organized particles to attract each other, as the particles of salt do in forming crystals. He also contends for the power of the imagination of pregnant women, in marking and deforming the fetus; but though there are these, and other blinities, the work contains many useful practical rules for the management of infants, and for the cure of their diseases. It was translated into English and published in London, in 1755. Haller Bib. Chir. Elyo. Dict. Hill.

BROW-ANTLER, the first branch of the horn of a hart or buck, shooting out from the beam, or main horn, next the head.

BROW-POLE, in Carpentry, a beam which goes across or overthwart a building.

BROWALLA HEIDE, or BROWALLA HEATH, in Geography, a plain of Sweden in the province of Smaland, lying about two Swedish miles from Wexio, and famous for being the place where the Danes were totally routed by the heroic Bleuda, who commanded the Smaland women, in the defence of their husbands, who were engaged in another expedition. As a recompense of their bravery, the women of Smaland were honoured with extraordinary privileges, and wore a kind of martial head-dres; and they have still an equal share of inheritance with the men.

BROWALLIA, in Botany, named by Linnaeus in honour of Browallius, bishop of Abo, who defended the sexual system against Seitzbeck. Linn. gen. 772. Reich. 834. Schreb. 1056. Juss. 123. Gart. 304. Pl. 53. Wildl. 1170. La Maree. Pl. 535. Clas. didyma电机pistioidea. Nat. Ord. Liride-, Serorubularis Juss. Gen. Char. Hol. par. one-leaved, tubular, short, five-toothed, permanent; teeth rather unequal. Cor. monopetalous, funnel-shaped; the cylindric, as long again as the calyx; border flat, five-cleft; segments rounded, emarginate, the upper one a little larger than the rest, and constituting the upper lip. Stamens four, included in the tube; two longer with larger anthers, which close the throat of the corolla. Anthers smooth, incurved, converging; the inner ones two, the outer ones opening at the top with a small hole. Fil., stem ovate, retuse; style thread-shaped, the length of the tube of the corolla; stigma thick, four-lobed. Peric. capsule ovate, obtuse, clothed with the calyx, two-celled, many-seeded, two-valved; valves bisect at the top; partition flat, thin, parallel to the valves, and separating from the sides of the capsule as it advances to maturity, whence Linnaeus judged it to be one-celled. (Gart. and Juss.) Seeds numerous, small.

Eff. Ch. Cor. five-toothed, Cor. border five-cleft, nearly equal, spreading; throat closed by the two larger anthers.

Sp. 1. B. demissa, Linn. (La Maree Pl. 535). "Downy; peduncles alternate, one-flowered." Root annual. Stem herbaceous, about a foot high, branched. Leaves alternate, petioled, ovate-pointed, with short hairs on their petioles and nerves. Flowers axillary and terminating, solitary, shorter than the leaves. Corolla of a bright, but pale blue colour. Seeds sent to Mr. Miller from Panama, in 1755, who named the plant Dalea, in honour of Mr. Dale, an eminent English botanist, and sent the seeds under that name to Linnaeus, who thought proper to change the name to Browallia.

2. B. clara, Linn. (Curt. Bot. Mag. 14.) "Rather smooth, flowers one or more, terminating." Root annual. Stem about two feet high, cylindric, disch, much branched. Leaves lanceolate. Flowers of a beautiful violet-blue. Native of Peru. Both these species must be raised on a hot-bed in the spring, and may afterwards be transplanted into a warm flower border, where, if the weather be favourable, they will flower and ripen their seeds.

3. B. alatissima, Linn. "Upper leaves opposite, two flames the length of the corolla." Taken up by Linnaeus solely on the authority of Miller's figure; and as Miller himself did not insert it in the later editions of his Dictionary, it is a dubious plant.

4. B. humifusa, Forsk. "Hispid, prostrate, flowers axillary, nearly white, white." Stems slender, branched, hispid. Leaves opposite, oblong, sessile, narrowed at their base. Peduncles axillary, solitary, very short. Calyx hispidal, cylindric, with five thread-shaped divisions. Tube of the corolla straight, half an inch long; border open, almost regular, with four oval divisions. Calyx comprized, one-celled, many-seeded, enveloped by the calyx.

BROWFRAKENEN, in Geography, so called from part des Brafsarts, the port or haven of brewers, a sea-port town of Zealand on the north side of the island of Schouwen, opposite to Goree. In 1426 a bloody battle was fought near this town between Philip, duke of Burgundy, and Humphrey, duke of Glouceter, brother to Henry V., king of England, who came with 8000 English to the assistance of Mary de Jaqueteine, countess of Holland, in which the duke of Glouceter was defeated; 8 miles S. of Goree and 8 S. W. of Helvotsylus. N. lat. 51° 42'. E. long. 4° 15'.

BROWWHEAD, a cape of Ireland, at the eastern extremity of Bailey Cove, in the south-western part of the county of Cork. N. lat. 51° 29' 30". W. long. 9° 40'.
Brown, Robert, in Biography, the founder of the sect denominated Brownists, was the son of Anthony Brown, esq. of Tolthope, in Rutlandshire, and the grandson of Francis Brown, whom King Henry VIII., in the 18th year of his reign, privileged by charter to wear his cap in the presence of himself, his heirs, or any of his nobles; and not to uncover but at his own pleasure; which charter was confirmed by act of parliament. This defended of an ancient and respectable family, nearly allied to the lord treasurer Burleigh, he was born at Northampton, towards the middle of the 16th century, studied divinity in the university of Cambridge, and afterwards became a school-master in Southwark. Adopting the opinions of Cartwright (see Cartwright), he determined to form from them what he conceived to be a more perfect system of doctrine and practice; and, about the year 1580, he began to inveigh with intemperate vehemence and ardour against the discipline and ceremonies of the church of England, representing her government as Antichristian, her sacraments as superstitious, her liturgy as a mixture of popery and paganism, and the mission of her clergy as no better than that of Baal’s priests in the old Testament. In the following year he preached at Norwich to a Dutch congregation, in which were several persons inclined to Anabaptism; and having in this situation gained some professedes to his opinions, and establisht a character for sanctity and zeal, he formed a connection with a schoolmaster, whose name was Richard Harrison; and, with his assistance, he collected a number of disciples, partly Dutch and partly English, who, disapproving the forms and service of the established church, were formed into a separate society under the denomination of Brownists. Upon this, Brown was accused before Dr. Frenke, bishop of Norwich, and other ecclesiastical commissioners; but as he persisted in maintaining his opinions, and behaved in an unbecoming manner before the court, he was committed to the custody of the sheriff, from which, however, he was released by the interposition of his relation, the lord-treasurer Burleigh, who candidly imputed his error and obliquity to zeal rather than malice, and recommended reasoning rather than harsh treatment, as the most likely means of reclaiming him. The lord-treasurer’s letter to the bishop produced the desired effect. His lordship afterwards requested archbishop Whitgift to give his kinman necessary instruction and counsel; but Brown left the kingdom, and settled at Middelburg in Zeeland, where he and his followers obtained leave of the States to worship God in their own way, and to form a church according to their own model; a sketch of which was drawn up by Brown, in a tractate printed at Middelburg in 1582. This confisht of three tracts; the first entitled “A Treatise of Reformation, without tarrying for any, &c.;” the object of which is to excite the people to withdraw from the church, and unite with him, and to exclude the civil magistrate from any authority over ecclesiastical persons and concernis; the second is, “A Treatise upon the 23d chapter of St. Matthew, &c.” in which the author explains against the abuse of tongues in preaching, that is, against the use of Hebrew, Greek, or Latin, inermens, also, against the use of logic and rhetoric, &c.; against disorderly preaching at St. Paul’s crofs, &c.; and against parish preachers and hired lecturers: and the third is entitled, “A Book which sheweth the Life and Manners of all true Chritians, and how unlike they are to Turks and Papists, and Heathen folk, &c.” Some time before the year 1585, Brown left Middelburg, and came over to England; for in this year he was cited to appear before archbishop Whitgift, to anwer to certain matters contained in a book published by him; and when he had been brought, by the prelate’s reasoning, to a tolerable compliance with the church of England, he was sent to his father in the country, and recommended by the lord-treasurer to his favour and affection. Brown’s opinions, however, were too deeply fixed to be easily eradicated; and therefore his father, with a severity very different from the conduct of the lord-treasurer, disowned him for his son, and expelled him from his house. Brown had now no settled habitation, and encountered various hardships; but at length he settled in Northamptonshire, and perished in zealously propagating his tenets. Being cited to appear before the bishop of Peterborough, he refused to obey, and was excommunicated for contempt. This cenfure alarmed and humbled him; and having made his submission, he obtained absolution. Accordingly, about the year 1590, he renounced his principles of separation, from that time continued in the communion of the church, and was soon after preferred to the rectory of a church in Northamptonshire. Fuller, however, is of opinion, that Brown never formally recanted his opinions with regard to the main points of his doctrine; but that his propitie of a general compliance with the church of England, improved by the countenance of his patron and kinman, the earl of Exeter, prevailed upon the archbishop, and procured this extraordinary favour for him. He adds, that Brown allowed a salary for one to discharge his care; and though he opposed his parishlers in judgment, yet agreed in taking their tythes. His sect, however, long survived his revolt; and of its peculiar tenets an account is given under the article Brownists. Brown is represented as a man of good parts and some learning; but his temper was inimical and uncontroilable; nor was his cordial agreeable to the Sabbatarian strictness which was afterwards professed by his followers. Fuller says of him, that he had a wife with whom he never lived, and a church in which he never preached, though he received the profits of it; and as all the other feeces of his life were stormy and turbulent, so was his end; for the confable of his parish requiring somewhat roughly the payment of certain rates, his passion moved him to blow; of which the confable complained to justice St. John, who inclined to pity rather than to punish him; but Brown behaved with such insolence, that he was sent to Northampont gaol, on a feather-bed in a cart, being very infirm, and aged above 80 years, where he soon after fickened and died, in the year 1630; after boating of his perccutions, and that he had been committed to 32 prifons, in some of which he could not see his hand at noon-day. Biog. Brit. Brown, Thomas, an ingenious writer, who lived towards the close of the 17th century, was the son of a farmer in Shropshire, and educated at Newport school in that county, where he acquired a considerable acquaintance with the Latin, Greek, French, Italian, and Spanish languages; which
which was farther improved at Christ-church, in the university of Oxford. But notwithstanding his literary attainments, his conduct was so irregular, that he was under a necessity of quitting the university; and, instead of returning to his father, he removed to London, where he was in danger of starving. In these circumstances of penury and distress, he was relieved, by being appointed school-master at Kingston upon Thames; a profidium; however, which, being very unsuited to his disposition, he soon abandoned. Returning to London, he commenced author; and employed himself in writing for the booksellers. His publications were very numerous, and consisted of dialogues, letters, poems, &c. in which his conduction was envied by his humour; for, in his writings, as well as in his conversation, he was always slyly and facetious. But though he had the reputation of a scholar, he was deficient of prudence; and, as he indulged his genius for satire to an extravagant degree, he was more likely to forfeit than to conciliate the friendship of those who were able to afford him; and it was said of him, that he rather chose to lose his friend than his joke. He took pleasure in libelling both the clergy and laity, and his indecorous treatment of religion laid the foundation for remorse, which is said to have embittered the last moments of his life. Mr. Jacob informs us, that towards the close of his career, he was favoured by the end of Dorset; that being invited to dine with him in company with Dryden, and some other gentlemen of similar description, he found, to his agreeable surprize, a bank note of 50l. under his plate, at the time which Dryden was privy to another of 100l. Brown died in 1704, and was interred in the cloister of Weitminster Abbey, near the remains of Mrs. Behn, with whom he had been intimate. His works, consisting of dialogues, essays, declamations, fables, letters, from the dead to the living, translatius &c. were printed in 4 vols. 12mo. in 1767. They are not delibute of learning, and abound with humour, which is jilly charged with want of delicacy. Biog. Dict.

Brown, Moses, vicar of Olney, Berks, and chaplain of Morden college, was born in 1708, and was originally a pen author. In 1733, he published two dramatic pieces, called "Polidus, or distressed Love," a tragedy; and "All bedevilled," a farce, both acted at a private theatre in St. Alban's street. On the institution of the Gentleman's Magazine, he became a contributor to it; and obtained some of the prizes, offered by Mr. Cave, for the best poems; and, in 1736, he published a volume of poems in 12mo.; and, in 1749, "Sunday Thoughts," a poem, 12mo. In 1756, he published "Pecry Lodge," a descriptive poem; he also edited "Walton's complete Angler;" and, in 1773, re-published his "Pilatory Eclogues." He also translated Zimmermann, and was the author of some sermons. He died Sept. 13th, 1787. Biog. Dict.

Brown, John, a clergyman of the church of England, and an ingenious writer, was born in 1754 at Rothbury, in Northumberland, and educated, first at Wigtown, and afterwards at St. John's college, Cambridge, where he acquired great reputation. Upon his quitting the university in 1735, he took orders, and first settled as minor canon and lecturer in the city of Carlisle. In 1739, he took his degree of master of arts at Cambridge; and in the year of the rebellion 1745, he distinguished himself by his zeal for government, and by the intrepidity with which he entered as a volunteer at the siege of Carlisle. In the following year, he preached, on occasion of the trial of some of the rebels, two admirable discourses on the connection between religious truth and civil liberty, and between superstition, tyranny, irreligion, and licentiousness; and his avowed attachment to the principles of whiggism recommended him to the patronage of Dr. Osbaldeston, bishop of Carlisle, who obtained for him a living in Westmorland. About this time, his talents for correct and elegant versification were evinced, in a poem on "Honour," inscribed to Lord Lonsdale, and in an "Essay on Satire," addressed to Dr. Warburton, and prefixed to this eminent critic's edition of Pope's works. The friendship of Warburton was soon followed by that of Mr. Ralph Allen of Prior-Park, who entertained Mr. Brown at his house, and offered him pecuniary assistance. During his visit at Prior Park, he preached two sermons at the abbey-church of Bath; one of which, exposing the mischief of immoderate gaming, is said to have induced the magistrates to issue an order for the suppression of the public gaming tables. In 1771, he published a work which may be still regarded as one of his most capital productions: viz. "Essays on the Characteristics of the Earl of Shaftesbury," comprehending one "On Riddle," considered as a "Tell of Truth," another, "On the Motives to Virtue, and the Necessity of religious Principles;" and a third, "On revealed Religion and Christianity." These essays are written with elegance and spirit, and, at the same time, with candour and politeness. They were of course much read, and frequently re-published, so that a fifth edition of them appeared in 1754. In 1755, Mr. Brown was honoured with the title of doctor of divinity at Cambridge; and, in the same year, he ventured to appear before the public under the new character of a dramatic writer. With the assistance of Mr. Garrick, his tragedy of "Barbarossa" was exhibited on the stage with advantage; and this was succeeded in the ensuing year by "Athelian." Both these performances were published without his name.

The next publication which we shall mention, forms a kind of era in the author's life; it appeared in 1757, and was entitled "An Estimate of the Manners and Principles of the Times." This work was published at a time, when the spirits of the people were extremely depressed by some unprosperous events that had occurred at the commencement, and during the progress of the war, in which the nation was engaged; and it was designed to shew, that a vain, luxurious, and filthy effeminacy, in the higher ranks of life, marked the character of the age, and to point out the caucuses and the effects of this effeminacy. The "Estimate," adapted to the circumstances and disposition of the people, at the time when it appeared, was read with avidity, and several editions of it were called for, in little more than a year. It did not pass, however, unnoticed; it was attacked in a variety of publications; but the most effectual reply to it was, as Voltaire observes, that the English, from that period, began to beat their enemies in every quarter of the globe. In 1758, Dr. Brown published a second volume of the "Estimate," and afterwards, "An explanatory Defence of the Estimate, by way of Appendix;" but the circumstances of the country were changed, and the public attention dropped, so that these pieces, though well written, were much less popular. Besides, the vanity and superior confidence of the author, which had not escaped notice in his first publication, became now more conspicuous, and diffused even many of his admirers; nor could the avowal of the integrity of his intentions, and the greater modesty with which he vindicated himself, in the "Explanatory Defence," avail to remove the prejudices that had been conceived against him. Dr. Brown manifested an irritability of temper, and a propensity to quarrel with his friends and patrons, which prevented him from obtaining those ecclesiastical preferments, to which his literary reputation entitled him; so that the vicarage of St. Nicholas, in Newcastle, upon
B R O W N.

Leonard, with the office of one of the king's chaplains in ordinary, constituted the final form of his church promotions. In 1763, he published "An additional Dialogue of the Dead, between Pericles and Columb," which was appropriated to be a vindication of Mr. Pitt's political conduct against some reflections of lord Latham: and this was followed in 1764, by "The Cure of Saul, a sacred Ode," which was set to music, and performed as an oratorio; and by an ingenious and elegant performance, entitled "A Dissertation on the Rise, Union, and Power, the Progressions, Separations, and Corruptions of Poetry and Music." This dissertation, though ingenious and critical, advanced fanciful principles, and manifested a degree of credulity, with respect to the supposed effect of certain public institutions among the ancients, which gave rise to a variety of criticisms. In 1764, Dr. Brown detached from his "Dissertation" the substance of that part which related to poetry, and published it separately in an octavo treatise, entitled "The History of the Rise and Progress of Poetry through its several Species;" and, in the same year, he published a volume of "Sermons," being chiefly a collection of those which had hitherto been printed chiefly. Of the new are those excellent discourses on education, in which the author has unanswerably refuted some of the positions of Rousseau in his "Emile," and other speculations, and satisfactorily evinced the necessity and importance of forming the minds of children to early habits of piety and virtue. The author's attention was again directed towards politics, and in 1765, appeared his "Thoughts on civil Liberty, Levicent'fudens, and Faction," containing censures on those persons, who, at that time, opposed the measures of administration, and clashing with a prescribed code of education. As he proposed that this code should be adopted and enforced by government, it produced the animadversions of Dr. Prinikly, in his "Essay on the Course of a liberal Education, for civil and active Life." The author's discourses on education in general, were followed by a sermon "On the Female character and education," to which is annexed an appendix, in which he states, in a very liberal manner, the moral and political principles which should be inculcated on the attention of young persons; and, in his opinion, these are such as are evidently founded on the precepts of Christianity, and the laws of freedom. He proceeds farther to discuss the question, "whether there be any opinions or principles which ought not to be tolerated (or suffered to be taught) in a well-ordered, free community?" and to this question, he replies, that, in his judgment, there are many opinions or principles, tending evidently to the destruction of society or freedom, and which, therefore, ought not to be tolerated in such a community. Accordingly, he alleges influences in the three principal kinds, religious, moral, and political, taken from Mr. Locke, and supported by his authority. In 1765, appeared Dr. Brown's last publication, which was "A Letter to the R. W. Dr. Lowth, occasioned by his late Letter to the right Rev. Author of the divine Legation of Mofes," and repelling insinuations, unjustly suppos'd to have been aimed at his moral character, on account of his abdication and defence of Dr. Warburton. Besides the works already mentioned, Dr. Brown published a "Poem on Liberty," and some anonymous pamphlets. He had also announced an intention of publishing "Principles of Christian Legislation," but his design was frustrated by his death. In his will, however, he gave orders, among other particulars relating to the arrangement and publication of his works, that this treatise should be finished; but this part of his will was never executed.

At the time when Dr. Brown's discourses on education were published, Dr. Dumaresq had been invited to reside in Russia, and was employed by the emperors in suggesting regulations for the establishment and conduct of several schools, which he was about to erect in various parts of her dominions. On this occasion, a correspondent was proposed by a lady of England, between him and Dr. Brown, who entered largely into the subject, sketched the outline of a grand scheme of education, and also of legislation, for the Russian empire, and voluntarily offered to remove to Russia for the purpose of aiding in the execution of it. Dr. Dumaresq, after some previous deliberation and conference with Mons. Muller, his associate, on the business, translated Dr. Brown's paper into French, and presented it to M. de Panin, who had it before the empress. She was impressed by the communication; and Dr. Dumaresq was commissioned to invite Dr. Brown to the Russian court. He accepted the invitation; and received a remittance of 1000l. which the emperors had ordered towards defraying the expenses of his journey. The length of the journey, the changes of climate, and various other circumstances alarmed his friends, who observed, that his constitution was enfeebled by repeated attacks of the gout; and that they dissuaded him from the undertaking, which, after various preparations, he at length determined to renounce. As he had received only 200l. of the money that had been ordered, and returned above one half of it, after deducting the expenses which he had unavoidably incurred; his honour and integrity in the whole transaction were unimpeachable; more especially as he continued to transact with the emperors such observations as might serve to facilitate the execution of her plans, and render them effectual to the purpose for which they were adopted. This negotiation agitated the spirits of Dr. Brown; and its issue, in which, however, he thought it prudent to acquiesce, disappointed and mortified him. The pride of his temper, and the sense he entertained of his own importance, contributed, in no small degree, to that dejection of mind, which, concurring with a constitutional tendency to infirmity, led him to put an end to his life with a razor, Sept. 25th, 1766, in the 51st year of his age. Biog. Brit.

Brown, Sir William, M.D. of a respectable family in the county of Norfolk, was born in the year 1692. His father, who was a physician, first inspired him with a taste for the study of medicine. In 1707, when he was only 15 years of age, he was admitted of Peterhouse in Cambridge; and having passed through the preliminary degrees, he was in 1721 admitted Doctor in medicine. Of the respect he retained for his alma mater, and of his fondness for literature, he gave evidence, by leaving to the university of Cambridge a sum of money, the interest of which he directed to be laid out every year, in furnishing three gold medals, to be given to the three most successful candidates in Greek, and Latin poetry. Of the books left him by his father, he says, he kept for his pocket companions, Bleak's Greek Testament, Hippocrates's Aphorisms, and an Elzevir's Horace; from the first to draw divinity, from the second phycic, and from the last good sense and vivacity. Soon after leaving college, he went to Lynn in Norfolk, where he practised physic nearly thirty years, and as it appears, with reputation and profit; for speaking of his leaving that town, to come to London, he says, "The manly age and inclination, with conformable studies, I diligently applied to the practice of physic, in the country; where, as that age adviced, I fought riches and friendships. But bring at length fatigued with friends, whom truth, not flattery, had procured; fatigued with riches which Galen, not fortune, had presented; I returned to this college (of physicians) where I might addict myself totally to the service of honour."
This was about the year 1750. He did not, however, decline practice when he came to London, going wherever he was sent for; but as he was a humourist, and had many quirks in his manners, he never became very popular as a physician in this place. This did not prevent his receiving all the honours the college could bestow upon him. They gratified his vanity, his ruling passion, by electing him president two succeeding years. It was the custom, Sir William tells us, in his farewell oration, "to continue the president, an entire lifetime, five years. But two years, he adds, more than satisfy me; that each of the elects may, in his turn, hold the sceptre of prudence, no tenure pleasing longer than a year." He felt, however, this deviation from their custom, and the college probably lost a legacy; but they were obliged to pay him by, as his quirks had attracted the notice of Mr. Foot, the Ariiphantes of the age, who appeared in the Devil upon Two Sticks, one of his farces, in the costume of the doctor; the wig, the coat, the gaita, and every action so exactly imitated, that no one could doubt who was intended to be represented. At one of the exhibitions of this piece the doctor was present, and the next day he sent a card to Mr. Foot, complimenting him on having to happily represented him; but finding he had forgot the muff, he had sent him his own. This good-natured reproof disarmed Foot, and the imitation was discontinued. About the same time he became the subject of a print, in which he was caricatured not by distorting, but by giving an exact delineation of his person, dress, and gesture: the inscription is Fucens, eques, medicus, rhetor, dux, atque poeta. Ecce! 1771. The doctor, however, took all in good part, and continued rather to follow his own humour, than the manners and fashions of the world. As proofs of his good nature, and proofs of his being perfectly at peace with himself, we may mention that when he was at Lynn, a pamphlet being published to ridicule him, he nailed it to the outside of his door, that it might be read by all who passed by; and when he was in the 80th year of his age, he went to Batson's coffee-house, on St. Luke's day, in his laced coat and band, with fringed white gloves, to shew himself to Mr. Crosby, then lord-mayor. A gentleman present observing how well he looked, the doctor observed, "He had neither wife nor debts." He had, however, been married, and left one daughter, who became the wife of Martin Folkes, and mother to Sir Martin Browne Folkes, bart. From the time of his coming to London he lived in Queen square, Great Ormond street, where he ended his days on the 10th of March, 1774, in the 82d year of his age. He had always been fond of scribbling, and in the early part of his life printed (for they could hardly be said to be published, the circulation of them being nearly confined to his friends) "Translations, or Imitations, of certain Odes of Horace;" and afterwards, when in London, his "Harveian Oration," and "A Vindication of the College of Physicians against the Licentiates, and their Advocates, solicitor-general Murray." There he collected together, and in 1765, printed under the title of "Opuscula Varia, &c." He also published a farewell oration, on quitting the prebendary of the college, from which the principal traits of his life here given have been taken. New and General Biog. Dict.

Brown, John, a surgeon of eminence in London, published in 1678, "A Treatise of Glandules, and Strumas, the King's Evil, &c." 4to; and in 1681, "A complete Treatise of the Mafeles, as they appear in the Human Body," folio, London. This has been translated into Latin, and printed at Leyden, Amsterdam, Berlin, &c., though now superceded by more accurate descriptions. The plates are principally taken from Julius Caesarius. He also communicated to the Royal Society, an account of a difeased liver, which is published in their Transact. Hall. Bib. Anst.

Brown, Patrick, M.D. practiced medicine at Jamaica, and published in 1736, folio, "The civil and natural History of Jamaica, containing an Account of its natural Productions, Fossil, Vegetables, and Animals." He describes the manner practiced there, of cultivating the sugar-cane, coffeeter, cotton, ginger, and indigo, and of collecting aloes from incisions made in the knaves of the plant. Hall. Bib. Bot.

Brown, John, a celebrated teacher of medicine, born in the parish of Baunce in the county of Berwick, in the year 1735, of parents in a mean situation in life. In common with the children of other villagers in Scotland, he received his education at a grammar school. As his mind was much above the rank he was born in, his progress in literature was proportionably superior to the rest of his school fellows. He there imbibed a taste for letters; so that when he was afterwards put apprentice to a weaver, instead of attending to his business, his whole mind was bent on procuring books, which he read with great eagerness. Finding this disposition could not be conquered, his father took him from the loom, and sent him to the grammar school at Dunse, where the famous Dun Scotus had been educated. Here, under the tuition of Mr. Cruickshanks, he made such progress, that he was soon regarded as a prodigy. He read all the Latin classics with the greatest facility, and was no mean proficient in the knowledge of the Greek language. "His habits," we are told, "were sober; he was of a religious turn, and was so strongly attached to the sect of Seceders, or Whigs, as they are called in Scotland, in which he had been bred, that he would have thought his salvation hazarded, if he had attended the meetings of the established church. He aspired to be a preacher of a purer religion." An accident, however, disquieted him with this society, before he was of an age to be chosen a pastor, for which it appears he was intended. Having been prevailed on, by some of his schoolfellows, to attend divine service at the parish church at Dunse, he was summoned before the session of the feeding congregation, to answer for this offence; but his high spirit not brooking to make an apology, to avoid the censure of his brethren, and the ignominy of being expelled their community, he abdicated his principles, and professed himself a member of the established church. As his talents for literature were well known, he was taken, at the age of twenty, to the house of a gentleman in the neighbourhood of Dunse, as tutor to his son. Here he did not long reside, for what cause is not known, but went the same year, 1755, to Edinburgh, where he applied to the study of theology, in which he proceeded so far as to deliver, in the public hall, a discourse upon a preëdented portion of scripture, the usual step preliminary to ordination. But here his theological studies appear to have ended, and he suddenly left Edinburgh, and returned to Dunse, and officiated as an usher in the school where he had been educated. He now exhibited himself as a free-liver and free-thinker, his discourse and manners being equally licentious and irregular; which accounts for his declension of the study of theology. At Dunse he continued twelve months, from Michaelmas 1758, to the same time in the year 1759. During this time, a vacancy happening in one of the classes in the high school at Edinburgh, Brown appeared as a candidate, but was not successful. Soon after he was applied to by a student in medicine, at Edinburgh, to put his inaugural thesis into Latin. This task he performed in so superior a manner, that it gained him great reputation: it opened to him a path, which he
had not probably before thought of, for turning his erudition to profit. On the strength of the character procured him by this performance, he returned to Edinburgh, determined to apply to the study of medicine. "He had now," he said, "discovered his strength, and was ambitious of riding in his carriage as a physician." At the opening of the session, he addressed Latin letters to each of the professors, who readily gave him tickets of admission to their lectures, which he attended diligently for several years; in the interval, teaching Latin to such of the pupils as applied, and illusing them in writing their theses, or turning them into Latin. The price, when he composed the thesis, was ten guineas: when he translated their compositions into Latin, five. If he had been now prudent, or had not indulged in the most destructive excesses, he might, it is probable, in a few years have attained the eminence he promised himself; but he marred all by his intemperance. In no long time after this, his constitution, which had been hardy and robust, became debilitated, and he had the face and appearance of a worn-out debauchee. His bad habits had not, however, prevented his getting the friendship or affiance of Dr. Cullen, who, deeming of availing himself of his talents, employed him as a tutor to his sons, and made use of him as an assistant in his lectures; Brown repeating to his pupils, in the evening, the lecture they had heard in the morning, and explaining to them such parts as were abstruse and difficult. In 1758 he married, and took a house, which was soon filled with boarders; but continuing his improvident course, he became a bankrupt at the end of three or four years. He now became a candidate for one of the medical chairs, but failed; and as he attributed his failing this promotion to Dr. Cullen, he very unadvisedly broke off his connection with him, and became the declared enemy to him, and his system; which he had always before strenuously defended. This probably determined him to form a new system of medicine, doubting means to annihilate that of his former patron. As he had read but few medical books, and was but little versed in practice, his theory must have been rather the result of contemplation, than of experience. That in forming it, he was influenced by his attachment to spirituous liquors, seems probable from internal evidence, and from the effects he attributed to them of diminishing the number, as well as the severity of the fits of the gout, under which he suffered. He always found them more severe and frequent, he says, when he lived abstinence. One of his pupils informed Dr. Beddoes, "that he was used, before he began to read his lecture, to take fifty drops of laudanum in a glass of whipped, repeating the dose four or five times during the lecture. Between the effects of these stimulants, and voluntary exertions, he soon warmed, and by degrees his imagination was excited into phrenzy." His attention seems to have been simplified by this means, and to render the knowledge of it easily attainable, without the labour of studying other authors. All general, or universal diseases, were therefore reduced by him to two great families or classes, the athenic and the athetic; the former depending upon excess, the latter upon deficiency of exciting power. The former were to be removed by debilitating, the latter by stimulants, medicines of which the most valuable and powerful are wine, brandy, and opium." As athetic diseases are more numerous, and occur much more frequently than those from an opposite cause, his opportunities of calling in the aid of the powerful stimulants were proportionately numerous. "Spasmodic and convulsive disorders, and even hemorrhages," he says, "were found to proceed from debility; and wine, and brandy, which had been thought hurtful in these diseases, he found the most powerful of all remedies in removing them." When he had completed his plan, he published his theory, or system, under the title of "Elements of Medicine," from his preface to which the preceding quotations have been principally taken. Though he had been eleven or twelve years at Edinburgh, he had not taken his degree of doctor; and as he was now at variance with all the medical professors, not thinking it prudent to offer himself the degree, he went to St. Andrews, where he was readily admitted to that honour. He now commenced public teacher of medicine, making his Elementa his text book; and convinced, as it seems, of the foundations of his doctrine, he exulting demands (preface to a new edition of the translation of his Elements, by Dr. Beddoes) whether the medical art hitherto conjectural, incoherent, and in the great body of its doctrines false, was not at last reduced to a science of demonstration, which might be called the science of life." His method in giving his lectures was, first to translate the text book, sentence by sentence, and then to expatiiate upon the passage. The novelty of the doctrine procured him at first a pretty numerous list of pupils; but he was irregular in his attendance, and his habits of drinking increased upon him, they were more reduced in number, and he became involved in his circumstances, that it became necessary for him to quit Edinburgh; he therefore came to London in the autumn of the year 1759. Here, for a time, he was received with favour; but his irregularities in living increasing upon him, he came to his lodgings, in the evening of the 8th of October in 1758, intoxicated, and taking, as it was his custom, a large dose of laudanum, he died in the course of the night, before he had entered in his course; his lectures, for which he was making preparation. He had the preceding year published "Observations on the old Systems of Phyle," as a prelude to the introduction of his own; but it was little noticed. His opinions have, however, met with patrons in Germany and Italy, as well as in this country, and a few volumes have been written on the subject of them; but they are now pretty generally, and deservedly, abandoned. Beddoes' edition of John Brown's translation of his Elementa Medicinae, 1759. Brown, John, an ingenious artist and elegant scholar, was born at Edinburgh in 1753, and driven to the profession of a painter. Whilst he was at Rome, he became acquainted with Sir William Young and Mr. Townley, and accompanied them, as a draughtsman, into Sicily. In this island he was employed in taking several fine views of its antiquities, which were exquisitely finished, and preferred the appropriate character of the buildings which he intended to represent. Upon his return to his native town, after a residence in Italy of more than ten years, he gained the esteem of many literary persons by his elegant manners and instructive conversations on various subjects of art, and particularly on music, to which his knowledge was so extensive and accurate. He was particularly distinguished by the attention of lord Monboddo, who, in the fourth volume of the "Origin and Progress of Language," reprents him as eminently skilled in the arts of painting, sculpture, music, and poetry: nor was he less deserving of respect for his moral qualities than for his literary attainments. He visited London, where he was much employed as a painter of small portraits with black lead pencil, which, besides being correctly drawn, faithfully exhibited the features and character of the persons whom they represented. Death, however, deprived the public of this ingenious artist in 1758, by the progress of a disease, which he bore with a firmness of mind that had marked his character through life. Soon after his death, his "Letters on the Poetry and Mufic of the
the Italian Opera," were published in 12mo., together with an introduction, by lord Monboddo, in one volume, 12mo., 1789, for the benefit of his widow. Mr. Brown left behind him several very highly finished portraits in pencil, and many exquisite sketches in pencil, and in pen and ink, which he had taken of persons and places in Italy. The peculiar characteristics of his hand were delicacy, correctness, and taste; and the leading features of his mind were acuteness, liberality, and sensibility, joined to a character firm, vigorous, and energetic. His last performances were two exquisite drawings, one from Mr. Townley's celebrated bust of Homer, and the other from a fine original bust of Mr. Pope, generally supposed to have been the work of Rydburck. From these two drawings, two very beautiful engravings have been made by Mr. Bartolozzi, and his pupil, Mr. Bovi. Biog. Dict.

Brown, Abraham, one of the principal performers on the violin, before the arrival of Giardini, in this country. After the death of Felling, in 1752, he succeeded him at Ranelagh, as leader of the king's band, and at several concerts. But this performer, who had a clear, sprightly, and loud tone, with a strong hand, and had travelled throughout Italy, was ignorant of music, and the pieces he played consisted of notes, et rien que des notes: for he had no soul or sense of expression. He brought over a favourite solo of Tartini (the second in the second set, published by Walsh), with which alone he figured at all concerts, for at least five or seven years, without ever entering into Tartini's true style of playing it, or that of any performer of his school. Mr. Brown, however, had not the mortification either to feel or know his defects; but, on the contrary, was comforted with a full conviction of his superiority.

Brown, George, an Irish prelate, and the first bishop that eloped and promoted the reformation in that country; was originally an Augustinian friar of London, and educated in the house of his order, near Holywell, in Oxfordshire. He afterwards became provincial of the Augustinian monks in England. Having taken the degree of doctor of divinity at some foreign university, he was admitted to the same degree at Oxford in 1534, and soon after at Cambridge. Upon the perusal of some of Luther's writings, he entertained a favourable opinion of his doctrine, and recommended to the people to make their supplications solely to Christ, and not to the Virgin Mary, or the Saints. These sentiments procured for him the favour of Henry VIII., who promoted him in March, 1535, to the archbishopric of Dublin, and soon after appointed him one of the commissioners for executing the royal mandate, that obliged the Irish to renounce the papal supremacy. In the conduct of this business he encountered many difficulties; as he also did in carrying through the parliament, which met in Dublin, May 1, 1536, the bill for establishing the king's supremacy over the church of Ireland. During the progress of the reformation, when Henry began to suppress the monasteries in England and Ireland, archbishop Brown completed the design which he had formed of removing all superfluous relics and images out of the two cathedrals of St. Patrick's and the Holy Trinity, in Dublin, and out of the other churches in his diocese; and he placed, in their room, the creed, the Lord's prayer, and the ten commandments, in gold letters. In 1541, the king converted the priory of the Holy Trinity into a cathedral church, confounding of a dean and chapter; and the archbishop, three years after, founded in it three prebends, from which time it has been denominated Chirll-Church. The order of king Edward VI. for introducing into all the churches of Ireland the English liturgy, and the Bible in the vulgar tongue, though warmly opposed by the papist party, was readily received by archbishop Brown; and on the Easter day following, the liturgy was read at Christ-Church in the presence of the mayor and bailiffs of the city, and the lord deputy St. Legger; on which occasion the archbishop preached a sermon against keeping the scriptures in the Latin tongue, and against the worship of images. This sermon is annexed to the archbishop's life. When Dowdall, the primate, was deprived of this dignity, on account of his opposition to the royal order, it was conferred in October, 1554, on archbishop Brown; but upon the accession of queen Mary, he also was deprived both of the primatecy and archbishopric in 1554, under pretence that he was married; but in reality, because he had been zealous in promoting the reformation. He died about the year 1556, leaving behind him the character of a faithful subject, a zealous promoter of religion, and a pattern of meekness, cheerfulness, and benevolence. Biog. Brit.

Brown, William, an English poet, was born at Tavistock in Devonshire, in 1550, and admitted into Exeter college, Oxford, about the beginning of the reign of king James I. Having made very considerable proficiency in classical learning and polite literature, he left the college, and removed to the Inner Temple, London, where he devoted himself to the muses, and probably paid little attention to the study of law. In 1614, he published the first part of his "Britannia's Pastorals," 8vo.; a great part of which he seems to have written before he had attained his 20th year. In the following year he published "The Shepherd's Pipe, in Seven Eclogues," 8vo.; and in 1616, the second part of his "Britannia's Pastorals," which were well received, and gained him great reputation. He also wrote the "Inner Temple Mufique," and some other small poems, which are included in the edition of his works published by Mr. Davies in 1773., in three small volumes. In his Pastorals there is much poetical imagery, and sometimes beautiful description, and his verification is often very harmonious; but though he knew how to move the heart by strokes of genuine nature and passion, his writings abound with point and conceit, and other frivolous ornaments, which indicate a vitiated taste; with a fertile imagination and a vigorous mind, his judgment was perverted by those Italian models, which it was the fashion of his time to imitate. His descriptions, though picturesque, are extravagant; his conceptions, though strong, have marks of deformity; and his language never flows in a strain of continued purity. He could not plan with precision and delicacy, and was unable to join correctness with spirit. Such is the account given of his writings by an anonymous critic. In 1624, he returned to his college; became tutor to that earl of Carnarvon, who was killed at the battle of Newbury, and who is highly extolled by Clarendon; was created M. A. in that year; and was styled in the university-registrar "Vir omni humano literatura et bonarum artium cognitioe instructus." He was afterwards taken into the family of the earl of Pembroke; and, as Wood says, "got wealth, and purchased an estate." Towards the close of his life, he is supposed to have retired into his own county, and to have died there about the year 1645. Biog. Brit.

Brown, Sir Thomas, more known now as an antiquary, than as a doctor of physic, was born in the parish of St. Michael, in Cheapside, the 10th of November, 1625. Being left by his father, who died when he was young, an ample fortune, he was sent to Wenchellere school, and having passed through the usual exercises there in 1623, he was admitted a gentleman commoner in Pembroke college, Oxford. In 1627, he took his degree of bachelor, and three years after of master of arts. During this time, besides applying...

ng with ability to classical literature, in which he made great progress, he had attended to the study of medicine, which he practiced for a small time at Oxford. With a view of improving himself in that art, he determined on visiting the schools on the continent; but he went first to Ireland, where his mother then was with her husband, Sir Thomas Dutton, who held a post in that kingdom. With him he traveled over the greater part of Ireland; and Dutton collected what might be gathered there, in furtherance of his design. He went to France, and spent some time at Montpellier. He then visited Padua, and thence proceeded to Leyden, where he continued, until he took his degree of doctor in medicine. This was about the year 1633. In 1634, he came to London, and soon rendered his name famous, by the publication of his "Religio Medici," a work of deep reflection, and evidently the fruit of much study and attention. It was no sooner published, we are told, than it excited the attention of the world, by the novelty of its paradoxes, the dignity of its sentiments, the quick succession of images, the multitude of abstruse allusions, the facility of disquisition, and the strength of language with which it was written. He begins with declaring himself a Christian, but he has been claffed among the freethinkers. Whatever might be his inconsistency on some points, he favored the notion of guardian angels, allowed the reality of apparitions, and of diabolical illusions; and affirmed, from his own knowledge, the certainty of witchcrafts. This latter opinion is said to have had no small influence in occasioning the condemnation of some unhappy victims, the execution of whom was one of the latest instances of the kind that disgrace the English annals. His natural disposition, however, was averse from severity and intolerance; he declares himself to be an enemy to persecution, and he was almost tempted by his c.feuity, to doubt of the eternity of future punishments, and the absolute condemnation of virtuous heathens. His sentiments were those of philanthropy, and he inclined to a favourable opinion of mankind in general. In his moral compositions, however, he seems to have been more influenced by vanity, than by a real desire of improving mankind. Sir Kenelm Digby published observations upon the "Religio Medici," which are now generally bound up with the work. The remarks are acute and ingenious, but what seems most wonderful is, that it cost the writer only twenty-four hours in procuring, reading, and making his annotations on the book. It was soon after translated into Latin by Mr. Merryweather, a gentleman of Cambridge, and from his version it was again translated into Italian, German, Dutch, and French. An edition of the Latin version was published at Strasburgh, with large notes by L. Niclaus Molitarius. The peculiarities of this book raised the author, as it usual, Dr. Johnson observes, many admirers, and many enemies; it was only, however, profusely answered, by one writer, Alexander Ros, in a work, entitled "Medicus Medicatus," which was never much noticed. In 1637, he was incorporated in the university of Oxford, and then went and settled at Norwich, where he was much respected, and attained high reputation, Anthony Wood says, for his skill in his profession, which, in a few years, procured his admission as honorary member of the Royal College of Physicians in London. In 1641, he married Mrs. Dorothy Micham, a lady of a good family in Norfolk, and of great personal as well as mental endowments. These excellent qualities of the lady did not free him from the farcicins of the wits who remembered the Dr. had expressed a wish, in his famed works, that preoccupation or population might go on without the cohabitation of the sexes; which he called "the foolishest thing a wife man did." The doctor and his lady, however, lived together in great harmony for more than forty years, and left a son, who was educated to medicine, and three daughters. In 1646, he published his treatise on vulgar errors, "Plutodaxia Epidemica." In this he combats, with great learning and ingenuity, numerous notions or opinions on natural and other objects, which had obtained general credit, not only among the common people, but among physicians and other literary perfons. The work is, of course, miscellaneous, and occupies as many chapters as there are errors he wished to reform; but as it is in general circulation, and has been frequently reprinted, it is unnecessary to lay more of it, than that it added considerably to the fame the author had obtained by his former work. In this work, however, he opposed the Copernican system of astronomy, and contended for the immobility of the earth. In 1671, he was knighted by King Charles II., in his passage through Norwich, and with particular marks of esteem. He had before, viz. in 1658, published "Hydrographia," or Discourse on Urn-burial, together with the Garden of Cyrus, or the Quincuxial Lozenge, or Network Plantation of the Ancients, &c." In these he treats, Dr. Johnson says, with his usual learning, on the funeral rites of the ancient nations; exhibits their various treatment of the dead; and examines the subordinations found in his Norfolcian usus. There is not, perhaps, any one of his works which better exemplifies his reading or memory. It is scarcely to be imagined how many particulars he has amassed together, in a treatise which seems to have been occasionally written; and which, therefore, no materials could have been previously collected. This is the last work our author published; but he continued to live esteemed for his virtues, as well as for his literary attainments, until he had completed his 77th year, when he was seized with an affection in his bowels, which put an end to his life at Norwich, on his birth-day, the 19th of Nov. 1682. "Dr. Browne left several tracts in his closet, which, Whitefoot says, he defied for the press." Of these two collections have been published, one by Dr. Tenonson, in 1686; the other in 1732, by a nomenclater. "It is not on the praises of others, but on his own writings, that he is to depend for the eftem of posterity, of which he will not easily be deprived, while learning shall have any reverence among men; for there is no science in which he does not discover some skill; and scarce any kind of knowledge, profane or sacred, abstruse or elegant, which he does not appear to have cultivated with success. His style is vigorous, but rugged; learned, but pendent; deep, but obscure; it strikes, but does not please. His tropes are harsh, and his combinations uncouth. In defense, however, of his uncommon words and expressions, it should be considered, that his sentiments were uncommon, and that he was not content to express, in many words, that idea for which any language could supply a single term." Life of Sir Thomas Browne, by Dr. Samuel Johnson. Gen. Biog.

BROWE, Edward, son of Sir Thomas, was born at Norwich, in 1642, where he received the rudiments of his education. In 1657, when he was fifteen years of age, he was sent to Cambridge, and there continued his studies with diligence until 1665, when he took his degree of bachelor in medicine. He then went to Merton college in Oxford; and at the end of two years proceeded doctor. To perfect himself in natural philosophy, he went to the continent, and travelled over great part of Bohemia, Hungary, and Frulish, countries abounding with mineral productions, which he examined with particular care. On his return, he settled in London, and there published, in 1673, in 4to, the observations he had collected during his travels. This was so well received, as to induce him to revise, correct, and, at length,
in 1683, to enlarge it to two volumes in 4to. In London he became soon distinguished for his superior learning and abilities, and was made fellow of the Royal College of Physicians, and of the Royal Society, physician to Bartholomew’s hospital, and first physician to King Charles II. He assisted Dryden with a translation of the lives of Themistocles and Sertorius, toward his version of Plutarch’s lives, and is said to have given some communications to the Royal Society, on the subject of chemistry, in which we have the testimony of Mr. Boyle, he was more than commonly skilled. But his manners were so polite as his learning was various and profound, which made King Charles II., no ill judge of the characters of men, say, “He was as learned as any of the college, and as well bred as any at court.” He was, however, left out of the list of court physicians by James II., but was afterwards consulted by his successor, king William. In 1705, he was chosen president of the college of physicians, which office he continued to fill until 1728, the time of his death, which happened in the month of August in that year, at his seat at Northfleet, near Greenhithe, in Kent. Gen. Biog.

Browne, Simon, a learned minister, and writer amongst the Protestant dissenters, was born at Shepton-Mallet, in Somersetshire, about the year 1698, and received his academic education at Bridgewater under the instruction of the Rev. Mr. Moor. Distinguished by his talents and proficiency, he commenced the exercise of his ministry before he had attained the age of 20 years, and was settled for a consider- able time with a respectable congregation at Portmouth. During his residence in this town, he published, in 1766, his "Caveat against evil Company," and in 1709, "The true Character of the real Christian," in one volume 8vo. In 1716, he removed to London, and took the charge of the congregation in the Old Jewry, which was one of the most respectable and considerable in the kingdom. In 1720, he published a volume of "Hymns and Spiritual Songs, in Three Books," 12mo.; and in 1722, a volume of "Sermons." In his address to the congregation, prefixed to this volume, he avows it to have been his "design to promote pure, peaceable, and practical religion, without rage or bitterness against any, and to spread the spirit of Christianity, not that of a party." He adds, that "to raise the passions, without first settling the judgment right, is to carry the man into all the wildest and wanton freaks of enthusiasm."

"But, on the other hand, it will signify little to the ad- vancement of real religion to set the head right, if we cannot also warm and engage the heart. For though the affec- tions should not have the supreme direction, they must be the immediate springs of human action." Such were the principles and views with which he conducted his ministerial services, and which rendered the congregation at the Old Jewry so numerous and so respectable. The publication of his sermons was soon followed by "A Letter to the Rev. Mr. Thomas Reynolds," in which he reproaches these dif- senters, whole zeal for orthodoxy made them a target to compass their brethren, inconsistently with their principles as dissenters, to make very particular and explicit declarations of their belief in the doctrine of the Trinity, and in which he also pointed out the unreasonableness and inefficacy of requiring any subscription to human articles of faith.

Mr. Browne, having continued in the exercise of the pastoral office with great reputation on his own part, and very much to the satisfaction and improvement of his congregation for about 7 years, was visited, in 1725, with a very complicated and severe affliction, occasioned by the loss of his wife and an only son, which distressed him to such a degree, that he was for some time in a state bordering upon distraction; but his disorder at length subsided into a melancholy of a very extraordinary nature. He desisted from the duties of his function, and could not be prevailed upon to join in any act of worship, either public or private. He imagined to a God, by a singular influence of divine power, and in a gradual manner, annihilated in him the thinking substance, and utterly dissolved him of consciousness; that though he retained the human shape, and the faculty of speaking, in a manner that appeared to others rational, he had all the while no notion of what he said than a parrot. And, very comfortably with this, he looked upon himself no longer as a moral agent, a subject of reward or punishment." In this persuasion, he continued, with little variation, to the end of his life. He seemed to be much grieved, and to think his venality questioned, when he could not persuade others to think of him as he thought of himself. This incredulity, on the part of others, he sometimes represented as the judicial effect of the same divine power that had reduced him to his distressed state. For some time he was unwilling that any prayers should be made on his account; and he declined putting up any for himself, and refused even to say grace at table. Being once importuned to say grace at the table of a friend, he repeatedly excused himself; but the request being repeated, and the company kept standing, he manifested tokens of great diff- tress, and, after some inexpressible gestures and lamentation, expressed, with great fervour, this ejaculation: "Most merciful and Almighty God, let thy spirit, which moveth upon the face of the waters, when there was no light, descend upon me; that from this darkness there may rise up a man to prune thee!" On another occasion, when he was earnestly solicited to say grace, he at length complied, and expressed himself in the following manner: "Lord, I am nothing, I ask nothing, and I want nothing; but help these poor creatures, to those who are about to receive them!" It appears, however, that after his retirement into the country, and towards the close of his life, he was left uninclined to join in acts of devotion, and that he was even defirous that prayers should be put up for himself. At the commencement of his disorder, he felt so unhappy as to be frequently inclined to destroy himself; but afterwards became more calm and composed, and seemed to experience little or no terror of mind; and he was often not only rational and serious, but cheerful and pleasant in conversation, provided nothing was said relating to his own cafe. It is remarkable, that, whilst this strange phrenzy continued, his faculties appeared to be in every other respect in full vigour; his conceptions were clear, and his powers of reasoning strong; and he pursued his studies without intermission. His congregation rejoiced at him so much, that they delayed, for a considerable time, appointing a successor; but when he was reduced to the necessity of quitting the ministry, and his place was supplied by Mr. (afterwards Dr.) Chamber, Mr. Browne retired to his native town of Shepton-Mallet. He there amused himself with translating several parts of the ancient Greek and Latin poets into English verse. He afterwards composed several little pieces for the use of children, an English grammar and spelling book, an abstract of the Scripture history, and a collection of fables; the two last being in metre. He also amassed together, in a short compass, all the themes of the Latin and Greek tongues, and compiled a dictionary to each of these, in order to render the acquisition of those languages more easy and compendious. During the two last years of his life, he was employed in defending the truth of Christianity, against some of the attacks then made against it, and in recommending mutual candour to Christians of different sentiments con-
ending the doctrine of the Trinity. In 1732, he published, "A sober and charitable Disquisition concerning the importance of the Doctrine of the Trinity; particularly with regard to Worship, and the Doctrine of Satisfaction; endeavouring to show, that those in the different Schemes should bear with each other in their different Sentiments; nor separate Commonly, and call one another out of Christian Fellowship on this Account." He also published, in the same year, "A short Rehearsal to a ridiculous Infidel, in some Remarks on Mr. Walton's fifth Discourse on the Miracles of our Saviour; with a Preface concerning the Protection of such Writers by the Civil Powers," in which he proves, with great ability, that all such interpolations of the civil magistrate, to prevent attacks against Christianity, were extremely dishonourable to it. It was also in this year that he published his "Defence of the Religion of Nature, and of the Christian Revelation, &c." In all these treatises, written in his retirement, where he could derive little assistance from books, or the confidence of learned friends, he displays very extensive knowledge, and great powers of reasoning. To the last of the above-mentioned performances he had prefixed a very singular dedication to Queen Caroline, expressing the unhappy delusion under which he laboured, and which his friends, at the time of the publication, prudently suppressed. A copy of it, however, was preferred. It was published in the "Adventurer," No. 88, vol. iii. p. 155; and as it exhibits a very curious display of the state of his mind, we shall here subjoin it, for the gratification of those who have not immediate access to the other publications:

"Madam,

Of all the extraordinary things that have been tendered to your royal hands since your first happy arrival in Britain, it may be boldly said, what now befriends your majesty's acceptance is the chief.

Not in itself, indeed; it is a trifle unworthy your exalted rank, and what will hardly prove an entertaining amufement to one of your majesty's deep penetration, exact judgment, and fine taste.

But on account of the author, who is the first being of the kind, and yet without a name.

He was once a man; and of some little name; but of no worth, as his present unparalleled caufe makes but too manifest; for by the immediate hand of an avenging God, his very thinking substance has for more than seven years been continually walking away, till it is wholly perished out of him, if it be not utterly come to nothing. None, no not the least remembrance of its very ruins, remains, not the shadow of an idea is left, nor any fenfe that, so much as one single one, perfect or imperfect, whole or diminished, ever did appear to a mind within him, or was perceived by it.

Such a present from such a thing, however worthless in itself, may not be wholly unacceptable to your majesty, the author being such as history cannot parallel; and if the fact, which is real and no fiction, nor wrong conceit, obtains credit, it must be recorded as the most memorable and indeed astonishing event in the reign of George II. that a trait composed by such a thing was presented to the illustrious Caroline; his royal comfort needs not be added; fame, if I am not misinformed, will tell that with pleasure to all succeeding times.

He has been informed, that your majesty's piety is as genuine and eminent, as your excellent qualities are great and conspicuous. This can, indeed, be truly known to the great searcher of hearts only; he alone, who can look into them, can discern if they are sincere, and the main intention corresponds with the appearance; and your majesty cannot take it amiss, if such an author hints, that his secret approbation is of infinitely greater value than the commendation of men, who may be easily mistaken and are too apt to flatter their superiors.

But if he has been told the truth, such a case as his will certainly strike your majesty with all astonishment, and may raise that commiseration in your royal breast which he has in vain endeavoured to excite in those of his friends; who, by the most unreasonable and ill-founded conceit in the world, have imagined, that a thinking being could for seven years together live a stranger to its own powers, exercises, operations, and state, and to what the great God has been doing in it and to it.

If your majesty, in your most retired address to the king of kings, should think of so singular a case, you may, perhaps, make it your devout request, that the reign of your beloved sovereign and comfort may be renowned to all posterity by the recovery of a soul now in the utmost ruin, the restoration of one utterly lost at present amongst men.

And should this case affect your royal breast, you will recommend it to the piety and prayers of all the truly devout, who have the honour to be known to your majesty: many such doubtless there are; though courts are not usually the places where the devout retort, or where devotion reigns. And it is not improbable, that multitudes of the pious throughout the land may take a cafe to heart, that under your majesty's patronage comes thus recommended.

Could such a favour as this restoration be obtained from heaven by the prayers of your majesty, with what a transport of gratitude would the recovered being throw himself at your majesty's feet, and adoring the divine power and grace, profess himself,

"Madam,

Your majesty's most obliged
and dutifal fervant,
Simon Browne."

After his retirement into the country, the want of exercise, which he could not be persuaded to use, brought on a complication of disorders, and a mortification in his leg, which terminated his life at the close of the year 1732, in the 52d year of his age. His learning and knowledge were extensive. His theological sentiments were liberal, and he was a zealous advocate for freedom of inquiry. His piety and virtue were distinguished and exemplary; and he was animated by an ardent zeal for the interests of rational and practical religion. None who duly regard the talents he possessed and the public services of which he was capable, can forbear lamenting the malady under which he laboured. "His abilities," says one of his biographers, "made him respected, and his virtues rendered him beloved; but such was the peculiarity of his cafe, that he was at once an evidence of the dignity, and of the weakness of human nature." - Biog. Brit.

BROWNE, ISAAC HAWKINS, an ingenious and elegant poet of the last century, was born in 1706, at Burton-upon-Trent, of which parish his father was minister. Having received his grammatical education, first at Lichfield, and afterwards at Wellesminster-school, where he distinguished himself by his rapid proficiency, he was admitted, at the age of 16 years, into Trinity college, Cambridge; here he applied with singular affliliation, principally to classical literature, but without neglecting the appropriate studies of the place, or the various branches of mathematics, and the principles of the Newtonian philosophy; and such was the reputation which he
he acquired, that he was one of the first scholars elected upon
the foundation, established in 1724, by king George I. for
the study of modern history and languages, with a view of
qualifying young men for employment at court and in
foreign embassies. To this circumstance he alludes in his
poem on the death of the founder, which was the first
of his poetical productions, and much approved. About
the year 1727, he settled at Lincoln’s Inn, and published
the first of the law with a view to the profession of a barrister,
for which he was originally designed; but though he ac-
quired a considerable degree of knowledge, he never arrived
at any great eminence in the practice of the law, and relinqu-
ished it for a long time before his death, that he might
have the greater leisure for gratifying his inclination in lit-
erary pursuits. Poised of a fortune, which was adequate
to his desires, and which, by preferring the happy mean be-
tween extravagance and avarice, he neither diminished nor
increased, he was the less anxious about the emoluments of his
profession. Soon after his settlement at Lincoln’s Inn, he
addressed to his friend Mr. Highmore, the painter, a poem
on “Design and Beauty,” in which he adopted the elegant
ideas of the Platonick philosophy. Among other pieces,
poem to which the title was written, the imitation of
A. Philips was the production of his friend Dr. Hoadly,
chancellor of the diocese of Winchester.

In 1744, Mr. Browne married a lady, whose amiable
temper contributed very much to his domestic felicity; and
he was shown twice, viz. in this year, and again in 1748,
to serve in parliament for the borough of Wenloch, in Shrop-
shire. For this appointment he was indebted to the interell of
William Forrester, esq. who recommended him to the electors
from no other motive than the opinion he entertained of his ab-
ilities, and the confidence he had in his integrity and principles.
As he had obtained his seat without opposition or expense, and
without incurring obligation to any political party, he was
an independent member; and though he supported the ad-
ministration of Mr. Pelham, he never received any favour, nor
defied any employment. The love of his country, and an
ardent zeal for its constitution and liberties, formed a distin-
guishing part of his character. Although he poissed an
uncommon degree of eloquence in private conversation, he
was deterred, by a peculiar kind of delicacy and nervous
timidity, from ever appearing as a parliamentary speaker.
In 1754, he published his principal work, which was his
Latin poem “De Animi Immortalitate,” in 2 books, and
which unites the philosophical learning and elegance of
 Cicero, with the numbers, and much of the poetry of Lucre-
tius and Virgil. This poem was very much admired by the
best judges at the time of its publication, and its popularity
was so great, that several English translations of it soon
appeared. The best of these is that of Mr. Soane Jenyns, in
his “Miscellanies.” It was the author’s intention to have
added a third book, proposing to carry natural religion as
far as it would go, and in so doing, to lay the true foun-
dation of Christianity, of which he was a firm believer; but
of this book he only left an imperfect fragment. Having
passed through a life distilling mixed by private virtues, and
graced by a variety of accomplishments, Mr. Browne died in
1768, in the 52nd year of his age. His only son, Mr.
Hawkins Browne, to whose education he had paid particular
attention, and in which he had succeded to his wishes,
published an elegant edition of his poems, in large octavo,
in 1768. Several of them are also printed in Dodgley’s

Brown Bay, in the Manuge, is underfoold of horses of a
very dark chestnut colour.

Brown’s Bay, in Geography, lies on the south side of
Northfach harbour, near the call end of the island of Antigua
in the West Indies.

Brown’s Point, the north-west point of the peninsula
called Island Magee, in the county of Antrim, Ireland, at
the entrance into Loch-Larne. N. lat. 54° 51’ W. long.
5° 41’. Huddarth.—Alfo, a cape at the southern extremity
of the island of Tobago, in the West Indies. N. lat. 10°
10’. W. long. 60° 40’.

Brown’s Sound, lies on the north-west coast of North
America. N. lat. 55° 18’. W. long. 152° 20’.

The land on the caft side of this sound are tolerably level;
but on the west are mountains, which rife above the clouds, and exhibit
in winter a dreary aspect. The land abound with various
kinds of pines; the animals in its vicinity are deer, wolves,
sea-others, and fables; the fish are salmon, holluit, and a
species of cod, &c. In summer, ducks, geese, flags, &c.
are plentiful.

Brownsea, in Botony (named from Dr. Patrick
Wild. 1772. Lamarck. Bosc. Chas. monardifia end-
candia (deckeria, Schr.) Nat. Ord. Lomentaneae.—Lequini-
nae. Jul. Nat. Char. Calyx double; outer one-leaved, co-
ncal, with two unequal segments; inner longer, one-leaved,
funnel-shaped, with five divisions. Cor. petals five; claus
long, inserted within the tube of the inner calyx; bordera
ovate, obtuse. Stam. filaments ten or eleven, awl-shaped,
alternately shorter, attached to the tube of the outer calyx,
and united near the bottom; anthers oblong. Pift. germ
oblong, pointed, pedicelled, adhering to the tube of the inner
calyx; style awl-shaped; stigma blunt. Pericar-
py, leaque oblong, comprifed, bilocular, narrowed about
the partition; partition membraneous. Seds foli-
tary, ovate, comprifed, rather rugged, involved in fionous
fibres.

Cor. five-petalled.

Of f. Lamueas, Jacquin, &c. have considered the calyx as
single, and the corolla double; but from a careful con-
ideration of Lamarck’s figure of the coccus, we have been
induced to adopt the ideas of Juliffie, and the other French
botanists.

Sp. 1. B. coccinea. Linn. (Jacq. Amer. Pl. 121. Lamarck
Pl. 575. N° 1.) “Stamens the length of the corolla; pe-
duncles somewhat aggregate; branches smooth.” Wild.
A shrub from eight to ten feet high, branched. Leaves
abruptly winged, leaves of two or three pairs, ovate-lanceo-
late, sharply pointed, very entire, smooth, on shorted
petioles. Flowers lateral, large, scarlet, pendent, from fix to
ten together, on very short nearly united peduncles. Stame
num ten. A native of rocky woods, in South America.
2. B. grandiceps (Jacq. Collect. 3. Pl. 22. La Mareck Illif.
Pl. 575. No. 2.) “Stamens the length of the corolla;
flowers capitate-spiked; branches downy.” Wild. Foliakes
net-veined. Flowers scarlet, in a spike five inches long and
four broad. A native of mountainous woods in South
America. 3. B. Rafa de Mont (Bergius in Philof. Tran.
vol. 63. Pl. 8. p. 174. La Mareck Illif. Pl. 575. No. 3.)
“Stamens twice as long as the corolla; flowers in heads.”
Wild. A tree. Branches swelling into scattered knobs.
Branchlets, or common petioles, generally alternate, round,
smooth, rugged at the base, spreading. Leaves leathery,
about
about seven inches long, ovate-oblong, very entire, narrowing abruptly towards the end, smooth on both sides, with short petioles; the lower ones gradually diminishing; the lower ovate, a little heart-shaped at the base. Flowers collected into a head or spike, surrounded by a leafy involucre; buds or bracts ovate, rather sharp-pointed, somewhat membranaceous, concave, smooth, about two inches long, red, including one and sometimes two or three flowers, deciduous; the outer ones rounded, the inner smaller, and gradually becoming linear. Filaments constantly eleven. Gathered at Porto Bello in America, by a Mr. Pike, and sent to Burgos.

It does not appear that either of these three species has been cultivated in Europe.

Brownian Fanatics. See PAVOYA.

BROWFIELD, in Geography, a small settlement in York county, and district of Maine, in North America, which, together with Sourook, contains 259 inhabitants; so called in 1791 by Captain Gray in honour of Sam. Brown, clp. of Bollon.

BROWNIISTS, in Ecclesiastical History, a religious sect, which sprang out of the Puritans, towards the close of the 16th century, and derived their appellation from Robert Brown.

The revolt of Brown, already mentioned under his article, was far from being followed with the diffusion of the sect. On the contrary it daily increased; informing that Sir Walter Raleigh, in a speech, delivered in the house of commons, in 1595, computes no less than twenty thousand followers of it.

The occasion of the separation of the Brownists was not any fault they found with the faith, but only with the discipline and form of government of the other churches in England. They equally charged corruption on the episcopal form, and on that of the presbyterians, by confidories, clacks, and synods; nor would they join with any other reformed church, because they were not assailed the fancifulity and generation of the members that composéd it, and on account of the toleration of sinners, with whom they maintained it an impiety to communicate. They condemned the solemn celebration of marriages in the church, and the use of the ring in marriage, as making it a sacramental sign, which encouraged the popish hereby, that marriage is a sacrament; and maintained, that marriage being a political act, the confirmation thereof ought to come from the civil magistrate. They would not allow any children to be baptized, whose parents were not members of the church, or of such as did not take sufficient care of the education of those baptized before. They rejected all forms of prayer; and held, that the Lord's prayer was not to be recited as a prayer; being only given for a rule, or model, wherein all our prayers are to be formed. They held, that the civil life of the ministry destroyed the efficacy of the sacraments; and they objected against bibles in churches, because, as they pretended, they were consecrated to the service of idolatry. They urged also many other objections against the forms and ceremonies of the established church, which are recapitulated in a small 4to. pamphlet, published at Middleburgh in 1595, on occasion of a controversy between Francis Johnfon, a Brownist, and H. Jacob, about some of the tenets of the Brownists, and entitled "A Defence of the Churches and Ministry of England, against the Reasons and Objections of Mr. Francis Johnfon, and others of the Separation, commonly called Brownists; in two treatises, published especially for the benefit of those in these parts of the Low Countries."

The form of church government which they established was democratical. When a church was to be gathered, such as desired to be members of it made a confession of it; and signed a covenant, by which they obliged themselves to walk together in the order of the gospel. The whole power of admitting and excluding members, with the decision of all controversies, was lodged in the brotherhood. Their church-officers were chosen from among themselves, for preaching the word, and taking care of the poor, and separated to their several offices by calling, prayer, and imposition of hands of some of the brethren. But they did not allow the priesthood to be any distinct order, or to give any indeclinable character. As the vote of the brotherhood made a man a minister, and gave him authority to preach the word, and administer the sacraments among them; so the same power could discharge him from his office, and reduce him to a mere layman again. And as they maintained the bounds of a church to be no greater than what might accommodate those who could meet together in one place, and join in one communion; so the power of these officers was prescribed within the same limits. The minister or paftor of one church could not administer the Lord's supper to another, nor baptize the children of any but those of his own society. Any lay-brother was allowed the liberty of giving a word of exhortation to the people; and it was usual for some of them, after sermon, to ask questions, and reafon upon the doctrines that had been preached. In a word, every church on the "Brownists" model, is a body corporate, having full power to do every thing which the good of the society requires, without being accountable to any clergy, synod, convocation, or other jurisdiction whatever. It has been said, particularly by Dr. Fulke, that if we compare the principles of the Brownists with those of the ancient Donatists (which see), we shall find them to be the same; and that Brown derived them from the Puritans and Separatists. Brown, it is said, was preceded by Bolton, and followed by Barrow, a man of ingenuity and learning, but, like many others of his sect, of a warm spirit, who was condemned and executed, at the instigation of the bishops, very much to the disgrace of the reign of queen Elizabeth. Indeed the laws were executed with great severity on the Brownists; their books were prohibited by queen Elizabeth, and their persons imprisoned, and many of them were hanged. The ecclesiastical commission, and the star-chamber, in fine, distressed them to such a degree, that they resolved to quit their country. Accordingly, many families retired, and settled at Amsterdam, where they formed a church, and chose Mr. Johnson for their paftor; and after him, Mr. Ainsworth, author of the learned commentary on the Pentateuch. This church, notwithstanding its unhappy intestine divisions, flourished under a succession of pastors for above 100 years. Other Brownists erected churches after their own model, at Arnhem, Middleburgh, Leyden, and other places. See AINSWORTH. The last period that appeared as an active supportor of Brownism was Robinson, who somewhat softened the dogmas of Brown, and endeavoured to unite the discordant members of his sect. For some time the followers of Robinson fecured a middle course between the Brownists and the church of England, calling themselves "Semi-Separatists;" but at length they proceeded farther than the Brownists themselves. The Brownists, though ranged under different leaders, generally retained the name of their founder for several years after his death; for in the civil war in 1640, &e. we read of a mob of 2000 Brownists, who entered St. Paul's church in London, when the high-commission court was sitting, and making a great tumult, cited out "No Bishops," "No High Communion," &c.; and in 1642, king Charles, in a speech made at the head of his forces on their march towards Shrewbury, mentions the Brownists, and by a strange kind of juxta-connection them
and the Anabaptists with Athyllis. In the following year he propos'd to the parliament to frame a good bill for the better preservation of the book of common prayer from the scorn and violence of Brownills, Anabaptists, and other sectaries. At length, however, the appellation of Brownills was changed into that of Independents, a denomination affirmed by those, who adopted many of their tenets, and conformed to their discipline. At the present enlightened period, when the principles of toleration are understood and inculcated, and a liberal spirit pervades all ranks of the community, the severity with which the Brownills were treated, will find no advocates; nor will any one attempt to justify or palliate their errors and misdeeds. Their rigid and narrow sentiments in point of discipline; their denying the church of England to be a true church; their maintaining that her government was so wholly Papish and Antichristian, as to render all her ordinances and sacraments invalid; and their not only renouncing communion with her, but with all other reformed churches, excepting such as should be of their own model, are sufficient proofs that they did not come behind their predecessors in bigotry. Nor is it unlikely, but that if they had rifen to power, they would have exercized it in a very unjustifiable manner. Neal's History of the Puritans, vol. i. p. 341—260—365—386—436. Neal of New Eng. tom. i. p. 58. Robinson, Apologia jutla, &c. Brownillorum et Barowillorum, 12mo. 1619. Biog. Brit. Art. Robert Brown. See Independents.

BROWNSEA ISLAND, in Geography, an island within the harbour of Poole, in England, containing about 800 acres of land, where the Danes landed in 1015.

BROWNSTOWN HEAD, a cape on the south-coast of Ireland, which is the eastermost point of Tramore bay, on the narrow channel of Rinlithank. N. lat. 52° 7'. W. long. 7° 7'.

BROWNSVILLE, or RED STONE OLD FORT, a flourishing port-town of America, in the county of Fayette, and state of Pennsylvania, on the south-eastern bank of Monongahela river, between Dunlap and Red-Stone creeks, and next to Pittsburg: the most considerable town in the western part of the state. The town is regularly laid out, and contains about 100 houses, an Episcopal and Roman Catholic church, a brewery, and a distillery. It is connected with Bridge-port, a small village on the opposite side of Dunlap creek, by a bridge 260 feet long. Within a few miles of the town are 4 Friends' meeting-houses, and 24 grist, saw, oil, and fulling mills. The trade and emigration to Kentucky afford a lucrative employment to boat-builders; 100 boats of 20 tons each being built here annually. Byrd's fort formerly stood here, on the south side of the mouth of Red-Stone creek, in N. lat. 30° 58'. W. long. 81° 12' 32"; 37 miles S. from Pittsburg; 13 S. by E. from Washington; and 341 W. from Philadelphia.

BROWS, or EYE-BROWS, are two hairy arches above the orbits of the eyes, bunching out by means of some fat under the skin in this place.

That end next the nose is called the head, caput, the other the tail, cauda, of the eye-brow.

The use of the eye-brow is partly to break the rays of light descending from above, that they may not dart too strongly into the eyes; and partly to be a screen to the eyes from sweat, dust, or other matter descending from the fore-head.

BROWSE, the tops of the branches of trees, wherewith beasts feed. This is sometimes also called bronce, and bristle; probably from the French brout, which signifies the same.

Browse more properly denotes the food which deer find in young copes, continually springing anew.

BROWSE, brows of, or BROWSEING brows, a denomination including all of the fallow kind, as the deer, roe-huck, rupicapra, &c.

BROWSE-wood, the name with spray or brushwood.

BROWNING, Brouther, among the French Gardeners, signifies breaking off the tips of the thinner branches of trees, when too long in proportion to their strength.

BROYE, in Geography, a river of Switzerland, which rises in the canton of Fribourg, traverses lake Morat, and issuing from thence, and winding through a marshy plain, discharges itself into the lake of Neuchatel.

BROYLE, a harbour, cape, and settlement on the east side of the island of Newfoundland; 15 miles N.E. from the settlement of Aquafort, and 30 S.W. from St. John, the capital. N. lat. 47° 7'. W. long. 53° 30'.

BRUZZO, a town of Italy, in the principality of Piedmont, 25 miles N. of Turin.

BRUSIEKIE, BRUESTZ, or BRUSEK. See Brzesk.

BRUSEK, a town of Poland, and capital of a patinate of that name, in the province of Czajov; 80 miles W.N.W. of Warsaw. It is situated in a marshy plain, and surrounded with a wall, rampart, and moat. N. lat. 52° 31'. E. long. 19° 35'.

BRUA, a river of Iceland, flowing from the south to the north.

BRUANT, in Ornithology. See Emberiza Citrinella.

BRUANT de l'Isle de Bourbon. See Emberiza Boreonica.

BRUARIA TEBRARIAR. See TEBRAR.

BRUCUS, Henry, in Biography, son of Gerard, one of the magistrates of Allo, in Flanders, was born in that city, in the year 1531. Having passed through the usual school-education, in which he distinguished himself, he was sent to Rome, where he taught the mathematics for some years; then turning his mind to the study of medicine, he went to Boulogne, and having completed his studies, and taken his degree of doctor, he travelled, for his further improvement, over a great part of France. At Paris, he was introduced to the acquaintance of Adrian Tarsney and Peter Rames. Returning to Allo, he was made physician and principal magistrate of the city. As he had become a convert to Lutheranism, he readily accepted the invitation of John Albert, duke of Mecklenburgh, to settle at Rostock, where he might with safety profess his religion. He was there appointed professor in mathematics, and soon became popular also as a physician. After residing here 25 years, he was feiz'd with apoplexy, of which he died, December 318. 1593. His works are, "Propositiones de Morbo Gallico," 4to. 1569. He recommends beginning the cure with the decoction of guiacum; that not succeeding, to have recourse to mercurial intumescences. "De Scorbuto Propositiones, de quibus publice disputandum est," Rostlock, 1589, and again 1591, 8vo. They are printed with Eugenius, "Liber Observationum de Scorbuto," Lipso, 1614, and. He attributes the origin of the disease to feeding on dried and salted meat, and to living in a cold and damp atmosphere. "Epistola de variis Rhus et Argumentum medicis, cum Smeti Miscellaneis, Franc. 8vo. 1611. Hallier. Bib. Med. Eloy, Dict. Hist.

BRUCCA, in Geography, a town of Italy, in the kingdom of Naples, and Principato Citra; 13 miles W. of Policastro.

BRUCE, James, in Biography, was among the most celebrated of our modern travellers; and it appears at present, as if the general credit of his narrative would survive those prejudices, under which it has long laboured from the sup-
supposed improbability of certain facts altogether repugnant to European habits and opinions.

He was born at Kinnaird house, near Falkirk, in Scotland, in the year 1730. His defect was ancient and honourable; on the female side, to his own inexplicable gratification, connecting itself even with royalty. He was educated at Harrow, where his proficiency is said to have been highly creditable to his talents. He was afterwards removed to the university of Edinburgh, where he became a law student. Circumstances, not necessary to the elucidation of his public character, occasioned him to alter his views, and enter into partnership with a wine-merchant in London, where of his father. The estate of Kinnaird devolved to him, and he now began to entertain thoughts of appearing in public life. The first outlays of political employment ended in disappointment to the adventurer: but Lord Halifax procured him the confidenship at Algiers; a situation, which he hoped, would facilitate the project he already entertained, of penetrating the interior of Africa. He went to Algiers in 1761, where he studied the oriental languages with much diligence. He likewise prepared himself for his great expedition by what may comparatively be considered as home travels, of which he never published any account, through Atlas Minor, the islands of Rhodes and Cyprus, and other contiguous countries. Some of his drawings on this expedition are in the king's library at Kew. The orientalist traveller has characterized this present as "the most magnificent ever made in that line by a subject of his sovereign." He seems, indeed, to have had very just ideas of his sovereign's dignity, as well as very high ones of his own; for, when the bey of Cairo desired to see him, and, after a long conversation, ordered him a purse of sequins, covered with fruit and flowers, Mr. Bruce accepted of one orange only, but positively refused the money. The bey requested to know the reason. "I am," said Mr. Bruce, "an Englishman, and the servant of the greatest king in Europe: it is not the custom of my country to receive pecuniary gratuities from foreign princes without the approbation of our sovereign." The bey, being himself a sovereign, was far from being displeased with the elevated sentiment of the exculp.

It was in June, 1768, that he commenced his great journey to the sources of the Nile. He failed in Alexandria, and thence proceeded to Cairo, which he left in December of the same year, embarking on the Nile, and navigating as far as Syene. He passed through Arabia Deserta and Arabia Felix, making various excursions into the latter country. His embarkation on the Red Sea took place in 1769, and in September he arrived at a small island on the frontiers of Abyssinia. In November he gained an entrance into the kingdom, and arrived at Gondar, the capital, in 1770. The limits of this article will not allow us to enter on his adventures, multiform and oftentimes extraordinary as they were. For a topographical and historical account of Abyssinia, we must refer to that head in the present work. In November, 1770, he arrived at the sources of the Nile. A considerable degree of fulfion has been thrown on his whole narration by the triumph with which he congratulates himself on having made a discovery that had eluded all prior research, when it is now generally understood that the Portuguese Jesuits had been at those very fountains before him. If he was acquainted with that fact, his vanity in that instance certainly triumphed over his veracity; but it does not seem necéssary to follow, that the whole must be treated as a romance. After all, though the interest of every journey should be pointed by some determinate object, the reader will probably be much more engaged by the detail of circumstances, and the delineation of manners and customs, than in a dry controversy, whether or not the traveller did really discover the sources of the Nile. In this point of view, travelling may be compared with sporting: the excise is of much more value than the game.

On his return to Gondar, he found Abyssinia in a state of civil war. He engaged on the part of the reigning prince, whose favour was attended with the inconvenience of a positive refusal to part with him. The plea of ill health, however, procured his release, and he was permitted to set out in the beginning of 1772. The difficulties to which he was reduced in this journey were extreme. His camels all perished; and he was obliged to abandon his drawings, papers, and implements, which however he afterwards retrieved. He arrived at Cairo with much difficulty, and the loss of nearly all his fortune. He passed some time with Buffon in France, and returned to England in 1773.

He retired to Kinnaird for the recovery of his health, and for a long time neglected the gratification of public curiosity. His time was occupied by the circumstances attending a second marriage, the improvement of the walls on his paternal estate, and the formation of a museum, enriched with Arabic and Abyssinian manuscripts, and various curiosities both natural and artificial. His work appeared in 1790, in 5 volumes 4to. It was eagerly read; but an air of vanity and arrogance pervading the style, seems to have inspired the public with a disposition to severe criticism, and incredulity, which the confirmation of many facts by subsequent travellers has already in some measure checked. Mr. Bruce died in April, 1794, in consequence of a fall in conducting some company down stairs, which at the time did not threaten such fatal consequences.

Mr. Bruce's figure was above the common size; his limbs athletic, but well-proportioned; his complexion sanguine; his countenance merry and good-tempered; and his manners easy and polite. The whole outward man was such as to announce a character well calculated to contend with the many difficulties and trying occasions, which so extraordinary a journey could not but have thrown in his way. His internal characters, the features of his understanding and disposition, seem in a great measure to have corresponded with these outward lineaments. As a country-gentleman, though not without a tincture of haughtiness, he exhibited the elegance of a man of fashion, and the hospitality of a Briton. Brome's Island, in Geography, an island in the Red Sea, on the coast of Abyssinia. N. lat. 23° 42'. E. long. 35° 30'. The south of it is high and rocky, and the north low and terminating in a sloping bank. Bruce gave it his own name. Bruce Hill, a considerable mountain in the south-western part of the county of Cavan, in Ireland, from which the river Erne takes its rise; 11 miles S.S.W. of Cavan.

with which he spoke of monks and priests, he left Florence in 1529, and repaired to Venice, where, in 1532, he published his Italian version of the Bible, which was dedicated to Francis I., King of France. This version was accompanied with an ample commentary in 7 volumes folio; containing some structures, which excited a suspicion, that the author had imitated some of the principles of the reformers. Although he pretended that he had translated directly from the original, Father Simon demonstrated that he had little knowledge of the Hebrew, and that he had generally used the Latin version of Pagninus. His work was condemned by the Catholics, but approved and encouraged by the Reformers; several editions of it were printed, the last of which is that of Venice in 1546-48; 3 vols. folio. Brucioli lived at Venice, without molestation; and employed himself in a variety of literary works. Besides Italian translations of Plato's natural history, and of several pieces of Ariostoe and Cicero, and editions, with notes, of Petrarah and Boccaccio, he published a folio volume of "Dialogues." Artzone writing to him in 1542, says, "Are you not satisfied with having composed more volumes than you are years old; and with having spread your name through the whole world?" He was still living in 1554. Nouv. Dict. Hist. Gen. Biog.

BRUCK, in Geography, a town of Germany, in the circle of Franconia, and principality of Cumbach, seated on the Redritz.

BRUCK, or BRUG, a town of Germany, in the archduchy of Austria, situate on the river Leyta. In the environs of this town asparagus grows spontaneously without culture. It is distant 25 miles E. from Baden, and 20 E. S. W. from Vienna.

BRUCK, a town of Germany, in the circle of Upper Saxony, and electorate of Saxony; 10 miles S.W. of Potsdam.

BRUCK, or Pruck, a town of Germany, in the circle of Bavaria and Upper Palatinate; 18 miles N. N. W. of Regensburg. See Pruck.

BRUCKENAU, a town of Germany, in the circle of the Upper Rhine, and bishopric of Freiberg; 14 miles S. of Fulda.

BRUCKER, JOHN-JAMES, in Biography, a learned Lutheran clergyman, was born Jan. 22, 1660, at Augsburg, and educated at Jena, where, in 1718, he took his degree of master of arts. In 1725 he returned to the place of his nativity; in 1724 he became rector at Kulinbergen; and in 1731, he was chosen a member of the Academy of Sciences at Berlin. Among his labors he was afterwards pastor of St. Ulrich's church, and lower minister; and died there in 1790. Among his works are the following, viz. "Tenienten Introduction in Hiliorum Doctrinae de Ideis," Jena, 1719, 4to.; "Mediationes Philosophicae de falsa virtute exemplo Alexander magus illustratis," ibid. 1720, 4to.; "Hiliorum Philosophicae Doctrinae de Ideis," Angil.; 1723, 8vo.; "De Vita et Scriptis Cl. Etranger," ibid. 1724, 8vo.; "Otium Vindicium, sive Delemetum Hiliorum-philoophicaeornm Triga," ibid. 1721, 8vo.; "Hiliorum Vitae Adolphorum Oceonum," Lip. 1734, 4to.; "Differtatio Epipol. de Vita Hier. Wolflin," ibid. 1739, 4to.; "De Hocelicrri Meritis in Rem Literataem," ibid. 1739, 4to.; "Hiliorum Historicae Philosophiae," ibid. 1727, 8vo. and 1756, 4to. But the most important work, to which he owes his chief reputation, is his "Historia Critica Philosophiae," published at Leipzic between the years 1742 and 1744, in four large volumes 4to. and reprinted at the same place in 1757, with large improvements and additions, in 6 vols. 4to. To Dr. Enfield the English reader is indebted for an excellent abridged translation of this comprehensive and learned work, published in
BRUCEL, in Geography, a town of Germany, in the circle of Upper Saxon, and county of Ruse; 1 miles W. N. W. of Geira.

BRUCKMANN, Francis-Ernest, in Biography, was born at Helmut, in 1157, and, having completed his studies, was created doctor in medicine, at the university there, in the year 1721. As his noble inclined him to botany, he travelled over Bohemia, Austria, and a great part of Germany, examining and collecting plants indigenous to those countries, and other natural productions. In return for his communications to the Academia Nat. Curiosis, and of Berlin; he was made corresponding member of those societies. Having finished his travels, he settled at Brunswick, where he continued in request to the time of his death, March 24th, 1753. When young, and before he had taken the degree of doctor, he published, "Specimen Botanicum, exhibens fungos subterraneos, vulgo tubera terrena dictos," Helmit. 1733, 4to, with engravings. He considered the black spots on the bark as seeds. In 1727, "Opuscula Medicina botanica," 4to. Brunswick. In this he treats of the medical qualities of various vegetable productions, among others of coffee, the use of which he condemns. "Epistola Itineraria," containing his observations on vegetable and other natural productions, collected during his travels. The epistles are 320 in number, the first century was published in 1742; the two last in 1749, 4to. They contain a great body of useful information. The titles of a few of the epistles follow, for the rest, or such of them as are most curious, consult Haller's Bib. Botan.

BRUCKEL, in Geography, a town of Germany, in the circle of the Upper Rhine, and county of Hannu Munzenberg; 2 miles N. of Hannu.

BRUCERII, in Ancient Geography, a people of Germany, placed by most geographers next to the Frisii, between the Amalphi, now the Ems, and the lake Fluvius, now the Zuyder Zee. They were powerful and warlike; but before the time when Tacitus wrote, (see Germ. 37.) that is, before Trajan's second confuconf, they had been exirigated by their neighbours, who had confi4ed against them; and their place was occupied by the Chernavi and Angri-vari. They were conquered by Drufus in a naval fight, on occasion of his first German campaign; again by The-erus in the 4th year of the Christian era; and afterwards, A. D. 14 and 15, by Germanicus. In the year 60 they joined Civilis in his attack upon the Romans. Towards the commencement of the 4th century, Constantine, having passed the Rhine, entered their country and laid it waste with fire and sword. Their villages were burnt, their cattle slaughtered, their men and women massacred, and those that escaped the sword, and were made prisoners, met with a still more cruel fate. As he judged them incapable of ever performing any really useful service, on account of their perfidy and invincible ferocity, they were condemned to the same punishment as the kings of the Franks, whom he had vanquished, and delivered to wild beasts, whole savage disposition they imitated.

BRUDUS, Emanuel, in Biography, son of the physician Dianhus, of Paris, practised medicine for some years in England. He published, in 1544, at Venice, "De Ratione Victis in singulis Februari ad Anglos," 8vo. It is a thick and bulky volume, and has been several times reprinted, once by Gernier, in 1555. He appears to have read the old Greek and Arabian writers with attention, and to have drawn his doctrine principally from them. Too slender a diet should not be given to the English in fevers, but care should be taken to keep up the strength of the patients. This should be done in all fevers, of which he describes the different stages, with the treatment in each. He never indulges in the vulgar, but some good practical rules may be deduced. "Dialogus circa quidam Questionis in Medicina," 4to, without date. Haller. Bib. Med.

BRUEGEL, in Geography, a town of Upper Guelderland; 10 miles S. E. of Venlo.

BRUEHL, Walter, or Brault, in Biography, a German physician, published in 1579, Antw. fol. "Praxis Medica, Theorica et Empirica, familiarissima, in qua morborum internorum cognitio, et curatio traditur." The work, though little noticed now, was in much estimation, as appears by its having passed through eight editions, the last printed at Venice in 1603, 8vo. It is dedicated to the earl of Huntington, which makes it probable the author had been in this country. Haller. Bib. Med. Prat. Eoy. Diet. Hift.

BRUEL, in Geography, a town of Germany, in the circle of Lower Saxon, and duchy of Mecklenburg; 12 miles N. E. of Schwerin.

BRUEL, Bragel, or Bragel, a town of Germany, in the circle of the Lower Rhine, and electorate of Cologne; 6 miles S. of Cologne.

BRUEYRE, a town of France, in the department of the Cher, and district of St. Amand, situated on the Cher; 1½ league N. W. of St. Amand.

BRUEYS, David-Augustin, in Biography, a French writer, was born of a protestant family, at Aix, in 1642, and educated for the bar; but his inclination to controversial theology led him to abandon the profession of an advocate; and, in 1662, he published an answer to bishop Boffu's exposition of the doctrine of the church. The bishop, however, converted him to the catholic faith; and after he had buried his wife, he entered into the ecclesiastical state, and distinguished himself as the champion of popery against Juren, Lefant, and other protestant divines. Of the sincerity of his conversion his subsequent conduct afforded some ground of suspicion; as he diverted his attention from theology and devoted it to dramatic subjects. Accordingly he composed several pieces for the stage, some of which were written in conjunction with his friend Palaprat. Of these the most celebrated are the comedy of "Le Grandeur," (the Grumble,) which Voltaire prefers to all the lighter pieces of Molier, and a revived ancient piece, called "L'Avocat Patelin," distinguished for its humorous simplicity. At a more advanced age he again renewed theological controversy, and wrote "The History of Fanaticism in our own times," relating to the state of religion in the

Cevennes.
BRUGES, John or, in Biography. See Evck.
BRUGES, in Geography, a town of France, in the department of the Lower Pyrenees, and district of Pan; 4 leagues S. of Pan.

Bruges, once a commercial, flourishing, and populous city of the Austrian Netherlands, and a bishop's see, and now, since the French revolution, the capital of a district, in the department of the Lys, which is divided into five parts: the first part containing, according to Thunnae's statistical view of France, 19,058 inhabitants, its canton 1,54,144, and its territory comprehending 2073 kilometres, and five communes: the second part includes 70,194, and its canton 13,022 inhabitants; its territory comprehends 70 kilomètres, and 4 communes: the third part contains 75,322, and its canton 13,896 inhabitants; its territory includes 105 kilomètres, and 7 communes; the fourth part contains 67,496, and its canton 14,320 inhabitants; its territory comprehends 107 kilomètres, and 11 communes; and the fifth part contains 28,821, and its canton 11,974 inhabitants; its territory includes 147 kilomètres, and 12 communes. According to this statement the population of Bruges amounts to 337,323 persons; but others, by a more moderate computation, diminish the number to 235,000. Bruges is about a league and a half in circumference; is advantageously situated for commerce, about 8 miles from the sea; and communicates, by means of navigable canals, with Ghent, Oitend, Nieuport, Furnes, Damme, Slayes, &c. As the adjacent country is nearly level, the water about it has no perceptible current; but it is easily changed in half an hour's time, by opening the sluces, and discharging it into the sea. According to Guiccardini, this city was in the 8th. year of the year 750; and took its name from a bridge called "Bruggock," in its vicinity, between Oudemage and Rademage or Ardembourg, which are two maritime towns, used to have had considerable commerce in this country, till they were ruined by the Danes or Normans. Out of the ruins of Oudemage was built the original town or castle of Bruges. In the 13th and 14th centuries, Bruges was the greatest emporium in all Europe. Navigation was then so imperfect, that a voyage between the Baltic and the Mediterranean could not be performed in one summer; and, therefore, it became necessary to establish a magazine or fochouse about midway between the commercial cities in the North and those in Italy. Bruges was selected as the most convenient station; and this choice of course introduced a vast wealth into the Low Countries. Bruges was at once the staple for English wool; for the woollen and linen manufactures of the Netherlands; for the naval stores, and other bulky commodities of the North; and for the Indian commodities, as well as domestic productions, imported by the Italian states. The extent of its commerce in Indian goods, with Venice alone, appears from one fact: In the year 1518, five Venetian galleasses laden with Indian commodities arrived at Bruges, in order to dispose of their cargoes at the fair. These galleasses were vessels of considerable bur-

den. The citizens of Bruges, enriched by its commerce, displayed in their dwellings, their buildings, and their mode of living, such magnificence as even to mortify the pride and excite the envy of royalty. To this purpose we may mention a singular instance. In 1301, Joanna of Navarre, the wife of Philip le Bel, king of France, having been some days in Bruges, was so much struck with the grandeur and wealth of that city, and particularly with the splendid appearance of the wives of the citizens, that she was moved (says Guiccardini, De rer. de Palsi Baffi, p. 408.) by female envy to exclaim with indignation, "I thought that I had been the only queen here, but I find there are many hundred more." However, in the year 1482, this city, became rich and also infidel, in consequence of its extensive commerce, had the authority to fix on Maximillian, king of the Romans, and to kill some of his minions in his presence. This violent inquiet brought about its ruin; for the emperor Frederick, father of Maximillian, took occasion to block up Sluys, its proper haven, by the affiance of Antwerp and Amsterdam, which had been for some time envies of its engraving the whole trade of the Low Countries; upon which the commerce removed from Bruges to Dort, and from thence soon after to Antwerp. According to Thunnae, Guiccardini, it removed directly to Antwerp, from which it went to Bruges in opulence and splendour. "To this time (says bishop Huet, in his "Memoirs of the Dutch trade") there was scarce a nation in Europe, how incalculable a power, that had not its proper merchant magazine or store-house at Bruges, and a company or factory there residing; as the English, French, Scots, Catalans, Portuguese, theof of Arragon, Catalonia, Biscay, Venice, Florence, Genoa, Lucca, Milan, Germany, Denmark, Sweden, and all the Hanse towns." The penurious, De Wit, in his "Interbel of Holland," accounts in a somewhat different manner for the losses of its commerce, which Bruges sustained. He says, that the fisheries and manufactures of the Netherlands increased more and more, together with the trade by sea to Bruges, which halted till the year 1482, when Hanlers had wars with the archduke Maximillian, about the guardianship of his son and his dominions, which continued for ten years. In the mean time, the Sea-port of Bruges, being most disturbed, those of Antwerp and Amsterdam, in order to draw the trade to their own cities, afforded the archduke in his unbridled tyranny and barbarous destruction of that country, and thereby regained his favour, and attained their own ends. Notwithstanding the decline of its commerce, Bruges, having a communication with the sea from Oitend, by means of a navigable canal, is still a place of considerable trade; and has various manufactures of broad fays, baize, and other woollen. 

Bruges was formerly in the diocese of Tournay; but in 1559, it was erected into a bishopric, by Philip II. King of Spain, subject to the archbishop of Malines. In 1430, Philip the good, duke of Burgundy, instituted at Bruges the order of the golden fleece. The parts about the city which belong to this order are called "Fraye of Bruges," and contain 37 villages, and accordingly enjoy certain immunities. The fiefs of Bruges, which are about 260 in number, are spacious, and the houses, though old, well built; it has seven gates, and six grand markets; but, having neither fountain nor river, the city is supplied with water from the rivers Lys and Scheldt, conveyed from Ghent by means of pipes. The principal buildings are the town-house, built in the Gothic manner, and situate in the large square called the Burg, the halls, the mint, &c. At the end of the square, called the grand market, is a fine steepel, 

BRUGES, in Ichthyology. See Squalus Maximus, great shark.
supported by four pillars, which is one of the most beautiful of the kind in Europe, 533 steps in height, and furnished with bells and chimes, which play a different tune every quarter of an hour. On the side of the great square is an edifice serving as a magazine for cloth, built over a canal, and so finished by pillars, that small vessels may pass under it, in order to cross the city from the canal of Olenst to that of Ghent. The square in which the Wednesday's market is kept, contains several walks between rows of trees, and a new guard-house in the middle. At Bruges there are several fine churches. The cathedral is dedicated to St. Donat, but the church of Notre Dame is the most beautiful, and its spire serves as a fea mark for the ships that are coming to Olenst; within it are two tombs of gilt copper, of extraordinary magnificence, and the rich veillments of Thomas à Becket, adorned with precious stones. In the high altar in the cathedral is a picture by Segers, viz. "The Adoration of the Magi," which is considered by Sir Joshua Reynolds as one of the best of that painter's works; and in the chancel is a picture by Jean Van Eyck, of the "Virgin and Child with St. George, and the other saints." Besides the cathedral and two collegiate churches, there are five parish churches, 14 chapels, and 12 convents for men and women. Bruges has also several alm-houses and schools, and it is distinguished by the provision which it affords for widows and orphans. There are still remaining 17 palaces or houses, that were the ancient habitations of so many confuls of trade. The magnificence of Bruges is composed of two burgo-masters, 12 chevins, 12 councilors, 6 penitories, and two preachers. This city, which is but indifferently fortified, was unsuccessfoully bombarded by the Dutch, July 4, 1704; in 1706 it submitted to the allies, after the battle of Ramilies; in 1708 it was invaded by the French and obliged to surrender; in 1709 the allies re-entered it, by virtue of a capitulation signed on the capture of Ghent, Dec. 30, 1709; and on the 24th of July, 1793, the magistrates opened the gates to the French troops, and signed a formal submission to the French republic. Bruges is 8 miles E. of Olenst, 24 N.W. of Ghent, and 46 W. of Antwerp. N. lat. 51° 15'. E. long. 3° 15'.

BRUGG, or BRUCK, a town of Switzerland, in the canton of Argow, seated on the river Aar. It formerly belonged to the counts of Hapburg, of the house of Austria; the inhabitants embraced the protestant religion in 1529. N. lat. 47° 23'. E. long. 8° 5'.

BRUGGEN, a town of Germany, in the circle of Lower Saxony, and bishopric of Hildesheim, on the east side of the Leine; 2 leagues S.W. from Hildesheim.

BRUGgen, or Broot, a town of Germany, in the circle of Westphalia, and duchy of Juliers, on the Schwalm; 6 miles N. E. of Kremund. On the 2d of March, 1793, a battle was fought near this town, between the Prussians, under the command of prince Frederick of Brunswick, and the French, in which the latter were defeated, with the loss of 1200 killed and 700 prisoners.

BRUGHAN, a river of North Wales, which runs into the Severn, about 2 miles above Llanidloes, in the county of Montgomery.

BRUGIAT, a town of France, in the department of the Allier, and district of Gannat; 2 1/2 leagues E. of Gannat.

BRUGNETTO, a town of Genoa, situate at the foot of the Apennines; the site of a bishop, suffragan of Genoa; 33 miles E. S.E. of Genoa.

BRUGIVIERA, in Botany, (named in honour of Brugiere, the well-known French botanist,) a new genus, formed by La Marek, for a plant placed by Linnaeus in the genus Rhizophora, to which it is closely allied, but differs in having a polygonous fruit. La Marek Illust. Pl. 397. Boc. Clas. dodendria monoepigynia. Nat. Ord. Haloracea. Cappifolia. Jull. Gen. Char. Col. one-leaved, open, permanent; segments ten or twelve, linear, acuminate, keeled without, channelled within, a little fleshy. Cor. petals ten or twelve, oblong, bifid at the summit, pointed, folded together lengthways so as to appear in some degree bivalved, ciliated, villous at the base, shorter than the segments of the calyx and alternating with them. Stam. from twenty to twenty-two; filaments attached by pairs to the base of each petal, and enclosed within its fold; anthers upright, oblong. Pyl. germ inferior, fyle triangular; stigmas three. Fruit, constricting at first of a capsule, which is semi-inferior, terminated by the permanent style, one-celled, one-seeded, formed in some degree out of the calyx: but when the seed contained in the capsule is come to maturity, its summit is prolonged into a nearly cylindrical body, a little angular, furrowed, with a blunt point, very smooth and shining, and from four or five inches to a foot long. This appearance is no other than the germination of the seed; and the prolongation is the radicle of the embryo plant, which having by its weight detached the seed from the capsule, fixes itself in the mud, into which it has fallen perpendicularly, in consequence of the capsule's having changed its original upright for a pendent position. This mode of germination is common also to all the species of the true Rhizophora. Eff. Calyx inferior, divided into ten or twelve segments; petals ten or twelve, doubled, having the flaments; flaments from twenty to twenty-two. Style, one; capsule one-seeded.

Spec. B. gymnornicha, "Leaves ovate-lanceolate, root above ground." Linn.; a specific character formed to distinguish it from the different species of Rhizophora. A tree about ten or twelve feet high. Trunk commonly crooked, covered with a thick, brown, rugged, cracked bark. Branches very numerous, extending in all directions, the lower ones throwing out naked flexible shoots, which strike into the earth, and, like the fig-tree of Bengal, produce new trunks, so that it is often difficult to determine the parent stock; the whole forming by the intermixture of the branches an impenetrable thicket. Leaves opposite, decussate, ovate, acuminate, smooth, very entire, on short petioles. Flowers solitary, axillary or lateral, greenish yellow, pendent. A native of the banks of salt-water rivers, and on the sea-shore in the East Indies. See Ray. Hill. Plant. and Savigny in Encyclopedic Methodique, under Palktuvier.

BRUGUIERE, JOHN, in Biography, a physician of Montpellier, founded a college for the maintenance and instruction of two young men, to be brought up to the practice of medicine, and dying without children in 1452, he left 800 ecus d'or, to purchase a piece of land, the rent of which was to be appropriated to the support of his institution, to which he also left his library. Aurore. Mem. pour servir a l'Huil de la faculte de Med. de Montp.

BRUGUIERE, La, in Geography, a town of France, in the department of the Tarn, and chief place of a canton, in the district of Caffres, 1 1/2 leagues S. of Caffres; the place contains 3929, and the canton 6856 inhabitants; the territory comprehends 137 1/2 kilometres and 7 communes.

BRUGIÈRES, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the district of Toulouse; 3 leagues N. of Toulouse.

BRUHESIUS, Peter, or Peter van Bruszen, in Biography, a physician of Brabant, born the early part of the
the 16th century, was so much esteemed as to be made physician to Eleonora of Auloria, sister to the emperor Charles V., while she was resident in the Low Countries. He afterwards settled in Bruges, and was appointed pen- 

sionary physician to that city. The time of his death is not 

known, but his memory was honoured by an epitaph, 

written in 1571, by the poet Nicolaius, who speaks 

highly of his professional abilities. He published, "De 

Thermarum Aquasgraneum Vitibus, Caufa, et legitimo 

Ufus, Epitole duce," 1550 and 1555. Antwerp, 12mo. 

"De Ratione medendi Morbi Articularis, 1592, in Henry 

Garret's Consilia Variorum de Arthritide." "De Ufus et 

Ratione Cauterorum," in the same collection. He was 

a believer in judicial astrology, and published "An Alma- 

nae," at Bruges, in which he sets down the precise times, 
or circumstances, under which bleeding, purging, and other 
operations might be safely undergone. Eloy Diet. Hist.

BRUIER, John James, born at Beauvais, the end 
of the 17th century, studied medicine at Angers, where 

he was admitted to the degree of doctor; he afterwards settled 
in Paris, and acquired considerable reputation by his practice, 
and by his writings. He died October 24th, 1756. In 
1733, he published a translation of Deventer's Treatise on 
Midwifery, under the title of "Observations sur le Manuel 
de l'Accouchement," 4to. Paris, and afterwards several of 
Hoffman's works; his "Medicain Politicus," 12mo. 
"Medicina rationalis," in 9 volumes, his treatise on fevers, 
3 vols. 12mo. "Le Caprice d'Imagination," &c. But the 
works by which he is most known, were his warnings 
against burying persons suppos'd to be dead, too early, "Dis- 
fertation fur l'Incertitude des Signes de la Mort, et l'Abus des 
He was at the pangs of collecting histories of persons who 
had revived, after being suppos'd to be dead, some of whom 
had been buried. Bodies ought not to be interred, he says, 
until putrefaction has commenced. "Memoire sur la 
Necesite d'un Reglement general au Sujet des Enterre- 
ments," 1745. No one should be buried until the fourth 
day from their dying. "Addition aux memoires," &c. 
adding to the number of examples of persons who had been 
buried alive, or had revived after being interred. These 
works have passed through numerous editions, and have 
been translated into every modern European language, and 
have doubtless been the means of preserving many lives. 
M. de la Soriniere, on his being received into the Royal 
Academy at Angers, read a copy of verses he had com- 
posed on the subject, beginning

Bruhier, ton immortel ouvrage, 
Ouvre les yeux a bien des gens, 
Sur l'abus, la cruel ufage, 
D'enterre les morts, tout vivans, &c.

BRUIL, a town of France, in the department of the 
Rer, and chief place of a canton, in the district of Cologne. 
The place contains 1933, and the canton 14,576 inhabi-
tants; and the territory includes 31 communes.

BRuja, Buff, in Ornithology. See Lanius Mada-
gascariensis, Gmel.

BRUIN, John de, in Biography, professor of natural 
philosophy and mathematics at Utrecht, was born at 
Gorem in 1620; and having pursued a course of philo-
sophy at Leyden, and prosecuted his studies at Bois-le-Duc, 
and Utrecht, he removed to Leyden, where he taught mathe-

matics. He afterwards became professor at Utrecht, and 
besides his official duties, made dissections in private and 
read lectures on Grotius's treatise, "De Juris Belli et Pacis." 
He was distinguished by his attachment to experimental 

philosophy and by his observations in astronomy. As an 
author, he published dissertations, "De Vi Altrice," "De 
Corporum Gravitate et Levitata," "De Cognitione Dignat 
naturali," "De Lucis Caufa et Origine," &c. He also 
maintained the Cartesian hypothesis in a dispute with Isaac 
Vossius, and wrote an apology for against a divine named 
Yoggell. In 1655, he married the sister of the wife of 
Daniel Elzevir, the famous bookseller of Amsterdam, and 
died in 1675.

BRUIN, John de, born at Amsterdam in 1681, was early 
initiated into the knowledge of surgery; but in 1700, de-
termining to confine himself to the practice of midwifery, 
he entered as a pupil to Roohuyzen, to learn of him 
the art of delivery in cases of difficulty, by means of an 
instrument he had invented, and which obtained the name of 
Roohuyzen's lever. Aided with this instrument, he was 
enabled to relieve and bring down the head of a fetus, 
that was firmly fixed in the pelvis, without injury to the 
mother, or the child. As this instrument, and the manner 
of using it, were kept secret by Roohuyzen, De Bruin 
paid a stipulated price for obtaining the knowledge of it; 
and became so skillful in using it, that he was consulted in 
all cases of difficulty. On his death, which happened 
January 23d, 1753, the secret was purchased by De Vil- 
cher, and Van de Pool, physicians at Amsterdam, and 
through them communicated to the world. Eloy Diet. Hist.

BRUISE, in Surgery. See Contusion.

BRUISER, in Mechanics, the name of a concave tool 
used for grinding and polishing the specula of telescopes. 
It is made of brass, about a quarter of an inch thick, and 
hammered as near to the gage as possible. It is timed on 
the convex side, and made equally broad at bottom and top. 
This serves to reduce the figure of the lenses, when it is 
too convex; and to rub down any gritty matter that hap-
ens to be mixed with the putty, before the speculum is 
applied to the polister. See Phil. Trans. vol. lxvii. part i. 
art. 16. and Smith's Optics, book iii. chap. 2.

BRUISING, in Pharmacy, signifies the operation of 
breaking or pounding a thing coarsely, or by halves; 
frequently practiced on roots, woods, and other hard bodies, 
to make them yield their juice or virtue more freely than they 
would do whole.

BRUT, Fr., Noise. The editors of the New French 
Encyclopedic, as well as Rouffeau, have honoured this 
sworn foe to music, and percursor of refined cars, with 
a long article. Rouffeau defines noise in general to be 
every motion of the air which strikes the tympanum, and is 
perceptible by the auricular organ; but, in music, noise is 
opposed to sound, and extends to every sensation of the 
ear which is not honorous and appreciable. To explain the 
difference musically, we may suppose that every musical sound 
is accompanied by its harmonics, and that noise having no 
Such coincident vibrations, has no determined tone or type 
in the harmonical system. Noise may, perhaps, be of the 
same nature as sound, but being produced by violence, and 
the aggregate of a confused multitude of different sounds 
heard at once, they mutually counteract the undulations of 
each other. All clastic bodies seem honorous in proportion 
as their matter is homogeneous, as the degree of cohesion is 
more equal throughout, and its body not divided into nu-

morous small maffes, which being of different solidity, con-
sequently give birth to warring sounds. Why should not 
noise produce sound, since it can excite it? For every vio-

lent noise makes the string of a harpichord sound, nor, in-

deed, any single string as a musical tone does, but the 
whole instrument at once; because no one finds its unison or harmo-
The brumalia were instituted by Romulus, who used, during this time, to entertain the senate. During this feast indications were taken of the felicity of the remaining part of winter.

The Brumalia were also called Hismalia.

BRUMALIS, in Ornithology, a species of Emberiza that inhabits the Tyrolean country, called by Latham the Brumal Bunting. Seopolis thus describes this little bird: body beneath, the front, and region of the eyes citron colour: hind head and neck cinereous.—Obi. The back is yellow brown, vent citron, thighs whitish, quill feathers brown, having the exterior margin citron.

BRUMATA, in Entomology, a species of Phalaena (Geometrida) the wings of which are yellowish, with a black streak, and a paler one behind. The female is apterous, or without wings, and spotted with black. Lar. Found on apple-trees.

BRUMATH, in Geography, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the district of Strauburg, 3 leagues N. of Strauburg. The town contains 2671, and the canton 12,957 inhabitants; the territory comprehends 1824 kilometres, and 21 communes.

BRUMEL, Anthony, the most ancient contrapuntist of the French school of whose compositions we have been able to find any remain, was contemporary with Juquin, and scholar of Okenheim; and though he is not likely to be inquired after by the present age, he was so respected in his day, that his name should not be confounded to the gulf of oblivion while a vestige of his works remains; and several thrill sufficed in Glareanus, and the Museum collection. The fame of the great musicians of antiquity is so established in books, that, though not a single relic of his works has been extant these two thousand years, their names and renown are still held in veneration by mankind.

BRUNOY, Peter, in Geography, a celebrated French writer, of the order of the Jesuits, was born at Rouen in 1688, commenced his novitiate at Paris in 1704, and finished his studies at Caen. Having been for some time employed in teaching rhetoric in different parts of the country, he took the vows of his order at Paris in 1712, and undertook the education of the prince de Talmont. He engaged for several years in the Journal de Trevoux, but in consequence of publishing father Margat's history of Tamerlane, he was exiled from Paris. On his return he continued his "History of the Gallican Church;" but having nearly finished the 12th volume, he was taken off by a paralytic stroke in 1742, leaving behind him the character of an amiable man and an esteemed writer. The work from which he acquired the greatest reputation was his "Théâtre des Grecs," in 3 vols. 4to; containing prose translations and analyses of the principal Greek tragedies, with considerations on the Greek theatre, &c. The author, whose erudition and taste are much esteemed by the best judges, has been confounded by some writers for manifesting too strong a bias toward the ancients, and Voltaire in particular is displeased for his not having allowed the superiority of the French theatre above the Greek. Brunoy published likewise, in 1711, a collection of his own pieces, in 4 vols. 12mo, containing Latin poems, founded upon the model of Lucretius, spittles, and dramatic pieces, tragic, comic, and pastoral. His poem on the "Nine Passions" has been much extolled for the elevation of its sentiments, and its poetic beauties. The discriminating excellence of his tragedies confits in the delineation of the tender passions. The "Revolutions of Spain," begun by father Orleans, were finished by Brunoy. Nouv. Dict. Hist.

BRUN, Charles Le, an eminent French painter, was the
the son of a sculptor, descended from a Scots family probably of the name of "Brown," and born at Paris in 1619. Manifesting in very early life the bent of his genius, so that at the age of four years he took coals from the fire for drawing figures on the floor, and at the age of twelve years made a good portrait of his grandfather, he was placed under the instruction of Vouet, whom he alienated by his rapid progress. In 1642 he was sent by the chancellor Seguier to Italy, where he continued 6 years, boarding in the house of the famous Poufelin and employing himself in copying the works of the principal masters, and in studying the censure of different ages and nations, so as to acquire the character of a learned painter. He also imitated the taste of Poufelin so exactly as to deceive several connoisseurs. On his return from Rome to Paris, in 1648, he was received into the Academy, and as he engaged in the highest branch of his art, historical and allegorical painting, and selected great works, he rose to the most distinguished rank in his profession. He was patronized by the superintendent Fouquet, and by him recommended to Cardinal Mazarin, and by his interposition, to the king. By the interest of Colbert, he was afterwards made the king's first painter, and ennobled in 1662. Lewis XIV. honoured him with peculiar tokens of favour, and frequently attended him whilst he was painting the family of Darius at Fontainebleau. In his five large pieces of the history of Alexander the great, he is said to have exhibited the exploits of that conqueror in a more glorious light than Quintus Curtius in his history. As an evidence of his attention to truth and nature, it is reported that he cauget Persian horset on to be drawn at Aleppo as models for those which he painted in Alexander's battles. He was employed by Colbert in painting the chapel and pavilion of Aurora at his seat of Stains, and by his interest he had the direction of the royal works, and particularly of the Gobelin manufactory, for the tapestry of which he made designs of the four seasons and four elements, that were engraved by Le Clerc. At the Gobelin he had handsome lodgings, and he was allowed a considerable pension. The Academy of painting was altogether under his direction, and he contributed in an eminent degree, by procuring an establishment at Rome for the gratuitous education of young artists selected from Paris, and in a variety of other ways, to the promotion of the fine arts in France, and to the peculiar magnificence of the reign of Lewis XIV. With a particular view to this last object, he was occupied for fourteen years in representing by history and allegory, in the great gallery at Versailles, the splendid events of this period down to the peace of Nimesgun. But the work, though he devoted to it much time and attention, became the subject of criticism, so that his reputation derived little advantage from it. When Louvois succeeded Colbert as superintendent of the royal edifices, Mignard was set up as a rival to Le Brun, and the mortification he experienced preyed upon his spirits, so that he fell into a decline, and died in 1690, leaving a wife but no children. Le Brun maintained, in his manners and style of living, the dignity of a man of quality: foreign princes testified their respect for his talents by the eagerness with which they endeavoured to obtain possession of his works, and the grand duke of Tuscany paid him the compliment of requesting a portrait of him for his gallery. Thus flattered and honoured, both at home and abroad, it is no wonder that his pride should be mortified by the advancement of a rival; more especially when we consider, that he manifested a jealousy of competitors in his conduct towards Le Snow, which was unworthy of his talents and character. When this great genius lay on his death bed, Le Brun, after having visited him, paid on his departure, "that death was taking a great thorn out of his foot," an expression which indicated want of becoming sensibility, and which occasioned the unfounded report that he had procured poison to be administered to his rival.

The distinguishing merits of Le Brun as a painter are greatness of conceptions, good ordonnance, expression, and elevation; but he is cursed for too much of the French school and affectation, a want of variety in his attitudes and draperies, and deficiency of colouring. Among the most eligible of his performances we may reckon the "Battle of Alexander," the merit of which has been more compromising by the excellent engravings of Girard Andram, the "Penitent Magdalene" much admired, the "Carrying of the cross," the "Crucifixion," and "St. John in the lake of Patmos." His designs have been copied by many capital engravers, and himself etched for his amplement several plates, in a dark bold style, manifesting the hand of the master, among which are the "Four times of the day" and an "Infant kneeling upon the cross," from his own designs.

As a writer, he is known for two works: one "On Phylogeny," and another "On the Passions," which latter has supplied various models for drawing. D'Argenville, Gen. Dict. Pilkington, Strutt.

Le Brun, Peter Le, a learned ecclesiastical writer, was born at Brignole, in Provence, in 1661, became a priest of the oratory, and was engaged for 13 years in giving lectures, at the seminary of St. Magloire, at Paris, on the Scriptures, councils, and ecclesiastical history. In 1693 he published "Letters to prove the illusion of Philosophers on the Divining Rod," afterwards published under the title of "Critical History of the Superluminous Practices which have reduced the Vulgar and embarrased the Learned, with the Method and Principles for discriminating the natural from the supernatural Effects," three vol. 12mo., in which the author admires the reality of disabolical illusions in his attempt to give a natural explanation of fraudulent deceptions. He also wrote "An historical and doctrinal Treatise on theatrical Spectacles," 12mo. in which he maintains their usefulness to a Christian. At the request of the Abbe Bignon, he published an elaborate work on "Liturgies," in 4 vols. 8vo. the first of which appeared in 1716, and three others in 1726. The opinions which he advanced on the consecration of the mass, involved him in a controversy, during the prosecution of which his life was terminated by a dunghill in the brea, in January, 1729. As a writer, he was profound and methodical, with a clear and simple style: and his piety was equal to his erudition. Nouv. Dict. Hid.

Le Brun, or Browne, Caepe, in Geography, lies in the N.E. point of the entrance into the great road of Toulon, on the coast of France, in the Mediterranean.

Le Brunca, La, a sea-port town on the west coast of the island of Sicily, at the entrance of the gulf of Catania, 16 miles south of Catania.

Lebrদi or Brundisium. See Brindisi.

Le Brunella, in Botany. See Brunella.

Brunelleschi, Philip, in Biography, an eminent Italian architect, was born at Florence in 1377; and in early youth having a taste for mathematics and mechanics, and a desire to learn sculpture, he became acquainted with Donatelli, a rising artist in this department, and accompanied him to Rome, in order to survey the monuments of architecture and sculpture in that capital. Here Brunelleschi employed his whole time, with indefatigable industry, in making drawings and taking measures of all the famous relics of antiquity, and having conceived a design of establishing his fame, by creating,
erecting, on a new plan, a dome for the cathedral of St. Maria del Fiore at Florence, he remained in Rome, after the departure of his friend, in order to qualify himself for this undertaking. As in his youth he had been initiated into the buffets of a goldsmith, he now found his knowledge useful in procuring a maintenance by setting jewels for the goldsmiths. In 1457 fickleness obliged him to return to Florence; and at this time the Florentines had convoked an assembly of architects and engineers to deliberate on the completion of the cathedral. Brunelleschi gave his opinion and then returned to Rome. Many plans were proposed for erecting the proposed dome; but Brunelleschi was singular in affording that a double dome might be raised to a sufficient height without that immense mass of timber-work which others had thought to be necessary. Having communicated his designs, he engaged the confidence of the magistrates, and he was employed in the execution of the work. He proceeded step by step, and lived to complete the dome as far as the lantern; carrying it to such a height, and executing it with such beauty, as astonished the whole country. Such indeed was the beauty with which it was executed, that Michael Angelo afterwards said, it would be very difficult to imitate, and perhaps impossible to surpass it. Brunelleschi was employed by Cosmo the Great in building the abbey of canon regular at Fiesole, and in forming for him the model of a palace, which his prudence and moderation would not allow him to execute. But as Cosmo preferred the more humble plan of Michelozzi, Brunelleschi was so indifferent that he destroyed his model, though its superiority was acknowledged by Cosmo. He afterwards undertook the construction of the Priti palace, and carried it up to the second story; but the completion of it, after his death, was the work of Ammannati. The church of St. Lorenzo in Florence was almost entirely the work of Brunelleschi. He was in no less skilled in military, than in civil architecture; and in this department, he gave to the duke of Milan the plan of a fortress for his capital; and he also contrived the two citadels of Pisa, and other fortifications in that part of Italy. As a civil engineer, he was employed in 1445, by the marquis of Mantua in constructing dykes for retaining the Po to its bed; and soon after the completion of this work, he died at the age of 60, much regretted by his brother-artists, and more so by the poor, to whom he was a father. His merit was more generally acknowledged after his death than during his life; for he had the mortification of seeing several of his undertakings left unfinished for want of due encouragement. Brunelleschi was also a cultivator of Italian poetry, and some of his burlesque verses have been printed along with those of Burchiello. D'Argenville, Tiraboschi.

BRUNET, in Ornithology, the name assigned by Buffon to Fringilla pecorum, which see. Thus also Brunet du Cap de Bonne Espérance. Buff. is turdus capensis, which see.

BRUNET, in Geography, a small island near the south coast of Newfoundland, at the entrance into Fortune bay. N. lat. 47° 15'. W. long. 55° 4'.

BRUNET, Cape, is the southern point of the entrance into the bay of Arcalson, on the west coast of France, from which a trail stretches off towards the sea, in the direction of W.S.W.

BRUNETTE, L.A., a strong and well-garrisoned fortress of Piedmont, near Susa, commanding two valleys. By an article in the peace concluded between the French and the king of Sardinia, in April 1756, this fortress was to be dis mantled.

Eff. Char. Calyx five-toothed, narrow; tube of the corolla very long; capsule one-celled, many-seeded, with a large fleshy receptacle.

Sp. 1. B. Americana, Linn. trumpet-flower. (La Mare Illul. Pl. 53.) "Leaves elliptic, acuminate, on long petioles; tube of the corolla erect; lobes of the border entire." Swartz. A tree of a moderate size. Trunk, the thickness of the human body. Branches loose. Leaves alternate, very entire, narrowed towards the base, smooth. Flowers growing three or four together at the ends of the branches. Tube of a pale colour, fringed with violet spots; border at first very white, at length pale yellow. Fruit nearly spherical, a little larger than a nut, of an orange colour, containing numerous nutlet seeds placed between the external covering and a fleshy succulent substance which occupies all the inside. La Mare. Bifolin, M. van de Sande Bakhuyzen, Martinico, and other West Indian islands. Cultivated by Mr. Miller, in 1739. 2. B. mandraca. "Leaves lanceolate-ovate, drawn to a point at both ends; petioles very short; tube of the corolla curved; border wavy." Swartz. Native also of Jamaica, &c.

Eff. Schubert's description of the receptacle not being reconcilable with La Mare's, and not being in itself very intelligible, has been omitted.

Both these species may be raised in the spring, either from seeds or cuttings, and should be treated like other tropical plants. In summer they should have much fresh air; but in winter much be kept close. With proper management they will produce flowers every season in June and July.

BRUNI, LEONARD, in Biography. See Anon.

BRUNIA, in Botany. (from Cornelius Brun, the celebrated traveller). Linn. 274. Reich. 293. Schreb. 176. Jull. 381. Gaert. 152. Pl. 36. Wild. 428. Veitneus, 1719, vol. iii. p. 474. A genus formed by Linnaeus for several shrubby plants, which have some resemblance in habit to Erica and Potentilla, and are allied in their mode of inflorescence to flaccis; but its distinguishing characters are not accurately fixed: for Linnaeus afterwards separated from it two of
of the original species, annexing one to *dioica*, and the other to *protetra*, and admitted an additional one, which he had formerly referred to *phytia*. Reichard was sensible that the species of Linnaeus differ from each other in the number of styles and situation of the germ, but left them as he found them. Gartnert also observed, that the genus *fleuros* need in minor thorough investigation; and that the plants with an inferior couple of flowers, either quite separate, or joined together, and filaments inserted on the calyx. This genus he called *fleuros*; but in honour of one of Linnaeus's disciples, it has since been named *fleuros*. The essential character of *fleuros*, as it stands in Schreber, consists of a superior germ, single style, and filaments inserted on the claws of the petals. But the confusion was not yet completely removed; for two of the species with a superior germ have decidedly two styles. It was therefore necessary either to divide the original genus into three, or to allow to *fleuros* a greater latitude with respect to the style. The latter has been preferred by the present French botanists, except La Marec; and we do not hesitate to adopt Ventenat's generic character of *fleuros*, especially as it corresponds with Willdenow's disposition of the species, though the essential characters of *fleuros* and *fleuros* in the German author are both erroneous. We shall only add, that some obscurity nevertheless remains, till we have new and accurate detailed descriptions of all the species taken from recent and complete specimens. Gen. Char. Receptacle common, tubular. Calyx common, many-lobed. Calyx proper, inferior, with five segments. Petals five, elongate, upright, clawed. Stam. five, attached to the claws of the petals. Pist. germ superior; style single or double; stigmas two. Pericarp, a dry pour, containing a hard, two-celled nut, with but few seeds. Eff. Char. Stamens on the claws of the petals; germ superior. Pericarp, a dry, two-celled drupe. Species. 1. B. nodiflora, Linn. (La Marec, Illfl. Pl. 126.) "Leaves three-fidged, curved inwards; heads of flowers terminal, on the lateral branches." Thun. A branched, evergreen underbush. Leaves very small, pointed, upright, closely imbricated, forming in the flender branches five longitudinal, somewhat spiral, angles. Heads of flowers whitish, about the size of a small cherry. Styles two. 2. B. pelace- ca. Linn. "Leaves three-fidged, upright, closely pressed to the stem; heads coriaceous, leathery, larger than the flowers." Willd. Similar to the foregoing. Leaves smaller. Heads of flowers many; panicked. Receptacle villous. Style two. 3. B. lanuginosa, Linn. "Leaves linear, very flender, spreading, smooth; heads of flowers globular, smooth, aggregate, terminal." La Marec. Little branches reticulated, with a woolly subtilance, in the manner of a spider's web, whence the trivial name. Leaves numerous, very small, smooth, tipped with a black point. Heads of flowers white, small, smooth, numerous. Bergius says, that the germ is inferior; but it appeared to La Marec in a dried specimen to be superior, incorporated with the top-shaped bace of the flower. Style awl-shaped; stigma sphen. If Bergius should prove to be right, and if, as the simple stigma seems to indicate, the fruit should be found one-celled, it must be removed to *fleuros*. 4. B. abrotanoides. Linn. "Leaves linear lanceolate, spreading, with three flat sides, ciliolus at the points." Linn. A much branched underbush, about a foot and half high. Leaves smooth, rounded. Heads of flowers small, smooth, terminative, many together, disposed somewhat in the form of an umbel. Style one, emarginate. 5. B. verticillata, Linn. jun. "Leaves with three flat sides, obtuse, smooth; little branches whorled, svidgiate; heads terminating." Linn. jun. Heads not globular. 6. B. lopidea. Willd. "Leaves with three flat sides, thread-shaped, with callos points, spreading, chlorite-villosa." Will. "Edges of the leaves thinly ciliated with long hairs." 7. B. fragriflora, Willd. "Leaves with three flat sides, depressed to the stem; the edges and the midrib thickly ciliated." Willd. These two are inferred from their habit; the flowers not being known. 8. B. ciliata, Linn. "Leaves ovate, acuminate, ciliate." Linn. Style all. All the species are natives of Southern Africa.

Cnfoma. La Marec, in the letter-prest to his plates, has retained all the species under *brunia*; and, in contradiction to his own descriptions published some time before in the alphabetical part, he has made a superior calyx part of its essential character. The germ of *b. nodiflora*, he now says, is certainly inferior; and it must be confessed, that he is in some degree supported by the high authority of Gartnert, who has figured the fruit of this species, and calls it femi-inferior; but through a strange inattention in the essential character, he describes the fruit as a capsule; in the general one, as a dry berry. He divides the genus into two families: 1. With globular heads of flowers, the *fleuros*; comprising the species described above, except the two introduced by Willdenow, and the *ciliata* of Linnaeus, which he appears to have discarded. 2. With heads surrounded by a lengthened, coloured calyx, forming a kind of involucre. This family consists of the two species, which have been referred to *fleuros*.

Professor Martyn has inferred under *brunia*, only the *lanu- gingo*, ciliata, and *verticillata*; aligning to *fleuros*, the *nodiflora*, *pel测ca*, and abrotanoides, as well as the *radiata*, and *glutiusa*, which constitute the *fleuros* of Willdenow, Ventenait, and Rofe. See Stavae. *Brunia levisiousus*. See Profet*ea* levifanus. *Brunia uniflora*. See Diggia Cupressina. "BRUNIQUEL, in Geography, a town of France, in the department of the Lot, and district of Montauban; 8 leagues S.S.E. of Cahors. BRUNN, John-James, in Geography, was born at Baffe in the year 1591. Applying to the study of medicine, he was admitted to the degree of doctor in that faculty in 1615; and in succession was advanced to the rank of professor in anatomy, botany, and in the practice of medicine. To the last he was appointed in the year 1529, and he continued performing the duties of these offices to the time of his death, in 1650. His work is "*Systema Materie Medicei, continens Medicamentorum simplicium et combinationem Seriem et Sylvan, Methodo medendi ac Formulis Remediiorum perfeclendis accommodatum*," Ed. 1630, 8vo. The work has been many times re-published; and in 1683, with notes, by Gerard Blafus. Hall. Bib. Med. Elloy. Dict. Hift.

BRUNN, in Geography, a town of Germany, in the arch- duchy of Austria, 4 miles W. of Horn.-Alto, a town of the fame archduchy, 8 miles W. of Ebenfurth. BRUNN, or Btui, a city and royal borough, the second town in rank, and the chief in commerce, of Moravia, the capital of a circle of the same name. Situated at the confluence of the rivers Schwarzez and Surtava. Although this city is not large, it is well-built and populous; the number of inhabitants being estimated at 18,000. It has considerable manufactures of cloth, velvets, and pluffs. The diocese of the state are held here, alternately with Olmutz. It is defended by a strong fortress called "Spillburg," erigi- ed on an eminence near the town, at the foot of which stand two cliffs of rock, and an hospital of the knights of
Malta. The Turks laid siege to this fortress in 1742, but were obliged to abandon the enterprise. In the town are six cloisters, the bishop's palace, a collegiate church, and a college of Jesuits. The cloister of Augustinian hermits is famous for an image of the Virgin Mary, pretended to have been made by St. Luke, and for a foundation for young ladies. Bruno is distant about 3 miles S.W. of Oltnitz, 10° S. E. of Prague, and 15° S. E. of Dresden. N. lat. 49° 10'. E. long. 16° 17'.

Bruno, a circle of Moravia, bounded on the north by Bohemia, on the east by the circle of Olmutz and Hradin, on the south by Austria, and on the west by the circle of Ljghau and Zagymin. In this circle are many iron-mines and forges, medicinal springs, quarries of marble, glass-houses, and alum-works. It is said to contain 70 towns, and above 20,781 houses. The capital is Bruns.

BRUNNEA, in Entomology, a name given to a species of Musca, that is entirely of a brown colour. Linn. This is a native of Europe.

BRUNNEA, an East Indian species of Vespa of the larger kinds. The prevailing colour is dull, ferruginous; and the front segment black at the base. Fabr.

The legs and antennae of this insect are ferruginous.

BRUNNEA, a species of Phalæna, having brown wings, with a large transverse yellow spot in the middle; margin cheetn brown. This is of the Natura family, and inhabits Germany.

BRUNNEA, a species of Chrysoma, of a small size, that inhabits New Holland. It is teallacous, with the future of the clytra, and a small line in the middle, fulvous. Fabr. &c.

BRUNNEA, in Natural History, a species of Planaria, of an oblong shape, and brown colour, with a longitudinal black line. Müll. Hüt. Verm. Its habitat unknown. This is nearly allied to nigra, another species of Planaria.

BRUNNEARIA, in Entomology, a species of Phalæna (Geometra), the wings of which are deep yellow, with a black margin above, and two black streaks beneath. This is a native of Italy.

BRUNNEATA, a species of Phalæna (Geometra), with ferruginous wings, and four abrupt brown bands. Inhabits Upid. Dorfl. Inf.

BRUNNEN, in Geography, a populous village of Switzerland, in the canton of Schwyz, situate in the midst of a bay formed by a branch of the lake Lucern, or lake of the four cantons; celebrated for the treaty concluded in 1315, between Uri, Schwyz, and Underwalden, which gave birth to the Helvetic confederacy. It was again distinguished in April 1798, by being the place where deputies from the cantons of Uri, Schwyz, Underwalden, and Glarus, unanimously determined to maintain their independence, and to refit the innovations of the French. Brunnen is separated from Schwyz by a pleasant and fertile plain, laid out in meadows, and planted with fruit trees, and distant from it about 1/2 miles S.W. N. lat. 46° 50'. E. long. 8° 27'.

BRUNNEOLUS, in Entomology, a Limnan species of Ichneumon, peculiar to Europe. The piercing colour is black; abdomen and legs reddish; antennae reddish, with the base black; posterior brown.

BRUNNER, Balthazar, in Biography, born at Hall, in Saxony, the middle of the 17th century; adorning himself to the study of medicine, was sent to the university at Erford, and afterwards to Leipzig, where he was admitted to the degree of doctor in that faculty. He then travelled over part of Italy, France and England, and having passed three years in those countries, returned to Hall, where he acquired much reputation for his learning and for his skill in his profession. He died in 1694. A few years after his death, were published, collected from his papers, "Conflitia medica, fammno studio collecta et revifa, a Laurencio Hoffman, Halae Sax." 1677, 4to. "De Scorbuto Transatus duo," 1678, twice printed with the treatise of Engelman, written in a methodical manner, and giving an accurate account of the disease. Among other remedies, he recommends the juice of water cress taken in milk whey. Though attached to alchemy, in which he was allowed to be expert, he left no written documents on that subject. Haller Bib. Med. Eloy. Dict. Hist.

BRUNNEN, John Conrad, a Swiss physician and anatomist of eminence, was born at Diefenichen, the 16th of January 1653. After passing through the usual school education, he was sent at the age of 16, to Strasbourg, where, applying himself to the study of physic, and anatomy, he was created doctor in medicine in 1672. For his thesis, he gave the anatomy of a child with two heads, which it was his fortune to meet with. He now went to Paris, and attended the schools and hospitals there, with such affinity, as to attract the notice, and gain him the intimacy of Dionis and du Verny, who were present while he made the experiments on the pancreas, which enabled him, some years after, to publish a more accurate description of that viscus, than had been before given, under the title of "Experimenta nova circa Pancreas. Accedit Distributane Lymphta et genuine Pancreatis ufu," Svo. 1683, Leiz. He proved that the fluid secreted by the pancreas is not necessary to digestion, and that an animal may live after that viscus is taken out of the body, having tried the experiment upon a dog, which perfectly recovered from the operation. On quitting Paris, he came to London, and was introduced to Dr. Willis, Lower, and Henry Oldenburg, secretary to the royal society. From England, he passed to Holland, and studied for some months at Leyden. At Amsterdam, he visited Swammerdam and Ruyfch, with whom he afterwards corresponded. Returning home, he was made professor of medicine at Heidelberg, and first physician to the elector palatine, who conferred on him the title of baron de Brun in Hamerlein. About the same time, he married one of the daughters of the celebrated Wepfer, and was elected honorary member of the academy of nature curiosif. In return for some ingenious disquisitions which he had communicated to them. In 1688, he published "Dissertatio Anatomica de Glándula piutaaria," 4to. Heidelbr. From this time, he became in such great repute, for his knowledge and success in practice, that he was, in succession, confided by most of the princes in Germany. Among others, in 1720, he was sent for to Hanover, to attend the prince of Wales, afterwards king George II. In 1715, he published at Heidelberg, "Glandula Duodeni Pancreas fecundum detextum," 4to, which was only an improved edition of his "De Glandulis in Duodeni Intellino detectis," which had been before twice printed. There are some other letters, the titles, and accounts of which are given by Haller, in his Bib. Anat. In the later edition of Wepfer's works are given disquisitions by our author, of the heads of some persons who died of apoplexy, of whom he had had the care. Though early afflicted with gravel, and in the latter part of his life with gout, he continued to attend to the calls of his patients, though living a great distance from his residence. When, in his 74th year, he went in great haste to Munich, to attend the elector Maximilian Emanuel, on his return, he was seized with a fever, which, in a few days, put an end to his existence, on the 2d of October 1727. Haller Bib. Anat. Eloy. Dict. Hist.
**BRU**

**BRUNNEUM**, in Entomology, a species of *Hister*, described as a Swedish insect. The colour is ferruginous; wing-cases somewhat triated. Linn.

**BRUNNEUS**, a species of *Curculio* of a large size, found at the Cape of Good Hope. The general colour is brown; beak fuscos; wing-cases tesselaceous, and streaked with dots. Fabr. Gmel. &c.

**BRUNNEUS**, a species of *Ptenus* of a brown colour, with the wing-cases very smooth, with pustulent flutes. Linn. &c. A native of Europe.

**BRUNNEUS**, a species of Cryptoccephalus, found in Europe, that is described by Linnaeus. The colour is brown; abdomen fuscos; wing-cases smooth.

**BRUNNEUS**, a species of *Elater* that inhabits Europe. The thorax is rufous, in the middle black; wing-cases and body ferruginous. Linn.

**BRUNNEUS**, a species of *Cimex*, of an ovate form, and brown colour, except the wings, which are white. This is found in Europe, and is described as above by Linnaeus.

**BRUNNEUS**, a species of *Asillus*, the thorax of which is cinereus, lincated with black; abdomen and legs brown, with black spots. Fabr. This kind is a native of Cayenne.

**BRUNNICHEN**, a species of *Eleus* of the *Tinea* tribe, named after Brunnich. It is of a black colour with three violaceous bands. Vandelli. &c. Inhabits Europe.

**BRUNNIPES**, a species of *Tenebrion*, the size of which is small. It is of a black colour, very smooth and glossy; wing-cases frizet; antennæ and legs ferruginous. Fabr. &c. Inhabits Europe.

**BRUNNIPES**, a species of *Staphylinus* of a black colour, with the legs and antennæ of the base and tip ferruginous. Inhabits Europe.

**BRUNNUS**, a species of *Cerambyx* of a brown colour; thorax armed with three spines; wing-cases obtuse, with two obscure elevated thorns; antennæ compreaff and short. Inhabits North America. Gmel. &c. *Obf.* The Cerambyx penfylavicus of Degeer.

**BRUNNUS**, a species of *Spinica*, (Sofia), the wings of which are brown, and without spots; posterior ones carminate. A native of Surinam. Fabr.

**BRUNO**, Giordano, in Biography, a bold innovating philosopher of the 16th century, was born at Nola in the kingdom of Naples; and, though he first entered among the Dominicans, the freedom of his religious opinions rendered it expedient for him to seek a refuge at Geneva in 1583. But the rigid system of orthodoxy, inculcated by Calvin and Beza, obliged him to leave this city, after a residence in it of two years, and to return to Paris, where, notwithstanding his opposition to the Ariditatic philosophy, he was allowed, for some time, to deliver public lectures in the university. In 1586, he defended for three days, in a solemn disputation, opinions concerning nature and the world, which he published in 1588, at Wittenberg, under the title of "Acrotithium, seu Rationes Anglicarum Physicarum adversus Peripateticos Parisis propositorum." Before this time, he took a journey to England, and formed an acquaintance with Sir Fulk Greville, and Sir Philip Sydney, to the latter of whom he dedicated two works. From Paris, he removed to Wittemberg, and made an open profession of Lutheranism. After a temporary residence at Helmstadt, and at Frankfurt, where he superintended an edition of his numerous works, printed by John Wechel, he settled at Padua, but being arrested, he was first confined in the prison of the inquisition at Venice, and afterwards at Rome. After two years' confinement, he was condemned by the inquisitorial tribunal, and burnt alive in February 1590. The crimes which have been alleged against him, were his Lutheran heresy, his defension from the Dominicans, and his atheistical opinions. Bruno was of a paradoxical turn of mind, and of a confident fantastic disposition; fond of advancing novel and fanciful sentiments, but confused and obscure in his method of explaining them. Bayle and La Croze have charged him with founding his philosophy on the principles of Spinoza; but, in reality, he attempted to unite the ancient eminente and atomic syllems. In his works are found obscure hints of the vortices of Des Cartes, the atoms of Gassendi, the optimism of Leibnitz, and the celestial physics of Copernicus; but his speculations on these topics are very darkly and inaccurately expressed; and he seems to have been more distinguished by his bold attack of ancient errors, than by his introduction and establishment of new truths. One of his most famous works is "Spaccio della Belfia triomphant," or the demolition of the triumphal beam; Lond. 1599. A work satirizing many received syllems of religion, and charged with advancing atheistical opinions. Besides several philosophical and theological writings, he was the author of an Italian comedy in prose, entitled "Il Candelonio," and of some Latin poetry.

**BRUNO**, a saint of the Roman church, and founder of the order of Carthusians, was born at Cologne, about the year 1040, and studied at Rheims, where he became a canon and regent of the public school. Compelled to leave Rheims by the tyranny of Manafes, the archbishop, he determined, in 1050, to retire from the world to the desert of Chartres, where, in 1054, he founded his new order. After residing in this solitude for 6 years, he was summoned to Rome by pope Urban II., who had been his scholar at Rheims; but disgusted with the manners of the capital, he withdrew to Calabria, and declining to accept the archbishopric of Reggio, he obtained from count Roger a forest, with its adjacent district, named la Torre, near Squillace, where he founded the second house of his order. In this retreat he died in 1101; and he was canonized by pope Leo X., in 1514. His works, which are enumerated by Cave, have been confounded with those of his contemporary St. Bruno of Segni, who flourished about the year 1087, and died in 1123. The principal treatises of Bruno, the Carthusian, are: a "Commentary on the Psalms," and another "On St. Paul's Epistles," besides several collections of sermons, and two letters to his disciples. A collection of his works was printed at Paris in 1552 and at Cologne in 1611, 3 vols. fol. Cave's Hist. Lit. vol. ii. p. 128.

For an account of the order estabished by Bruno, see CARThUSIANS.

**BRUNO**, James Pancrace, born at Altdorf on the 25th of January 1629, after receiving a liberal education in his own country, was sent to Padua, where he was admitted doctor in medicine in 1653. Returning thence, he settled at Nuremberg, and soon became distinguished for superior learning and abilities. In 1662, he was invited to accept the chair of professor in medicine at the university of Altdorf.
BRUNSFELD, a town in Saxony, city of Magdeburg and the principality of Anhalt and Holstein, on the Elbe, with the city of Tuscany.

BRUNSBURG, a city of Germany, in the circle of Lower Saxony, and district of Wolfenbüttel. It is the capital of the preceding duchy, and the residence of the prince, to whom it belongs, and who is usually styled the "duke of Brunswick and Wolfenbüttel." It is situated on the banks of the Oker, which enters the plain by two branches, with the city at its infula out of the city. It is accordingly divided into five different parts, called the Old Town, the New Town, the Hagen, the Old Wicke, and the Schie. The form of the town is nearly square, and its extent about 2 miles in circumference. The houses in general are old, and constructed of wood; but many new buildings have been lately erected, and the city is now day acquiring fresh beauty. It has several churches, one of which is for the accommodation of the Lutheran worship, which is the prevalent religion of the place, and others appropriated to the French and Dutch Calvinists, and to the Roman Catholics. Among the public buildings, we may reckon the prince's palace, which is an annexe to the library, containing a curious collection of scarce and curious bibles, or fragments of bibles in several languages, to the number of above 1000 volumes; With respect to the academy at Brunswick, Dr. Moore informs us, (View of Society and Manners in France, &c. vol. ii. p. 70.) that it has been a new modelled, and the plan of education improved, by the attention, and under the patronage of the hereditary prince. Students now resort to it from many parts of Germany, and some even from Great Britain. Such of them as are intended for a military life, will find advantages in this academy, superior to those that may be had at any other place on the continent. They will here be under the protection of a family partii to the British nation; every branch of science is taught by masters of known abilities; the young students will see garrison duty regularly performed, and may, by the interest of the prince, obtain liberty to attend the reviews of the Prussian troops at Magdeburg and Berlin: and they will have few temptations to exemplo in a town, where they can see no examples of extravagance; they will have few opportunities of dissipation, and none of grofs debauchery.

The reigning prince of Brunswick is said to administer the finances of the state with wife frugality, and to diminish the debts, in which, at his accession to the duchy, he found himself involved. As the father of his people, he employs his power to inculcate their prosperity and happiness. Many of their former burdens are already diminished, and property is not heavily taxed, and the finances are daily advancing to a better condition.

Brunswick is strongly fortified; and on the ramparts it has a mortar-piece of brass, 12½ feet in length, and 9 feet 2 inches in circumference, and weighing 1,800 quintals, which will carry a ball of 730 lbs. weight to the distance of 33,000 paces, and throw a bomb of 1,000 lbs. weight; but it requires 52 lbs. of powder for a charge. Although fortifications have occasioned much calamity to many towns in Germany, by attracting the vengeance of enemies, so that many of them are now disdained; those of Brunswick were of singular utility in 1761, when they prevented the town from being pillaged, and afforded prince Frederick an opportunity of gaining signal honour. When the town was besieged by a body of 20,000 men under prince Xavier of Saxony, prince Ferdinand detached 5,000 of his army under his nephew Frederick, affixed by general Luckner, with order to make an attempt for scaling the siege, and faving his native city. The prince dispatched a messenger to the governor, with a letter wrapped round a bullet, and which he was instructed to swallow, in case of his being taken by the enemy. However, he had the good fortune to make his way into the town; and the prince, in the middle of the night specified in the letter to the governor, fell sudenly on the enemy's cavalry, who, unprepared of his approach, were encamped carelessly within a mile of the town; and leaving by this sudden movement dispersed the cavalry, he produced an alarm among the infantry, which occasioned their retreat. Early in the morning, the young prince entered Brunswick, amidst the acclamations of his fellow-citizens, whom he had relieved from the horrors of a siege. On the arrival of his brother, the hereditary prince, at his father's palace, he found Frederick at table, entertaining the French officers, who had been taken the preceding night.

Brunswick was formerly one of the Hanse towns, and governed as a republic: but when it became a fortified city, its commerce was injured, and its population diminished. Its number of inhabitants is now estimated at about 22,000; the peasants are sober and laborious, and as they are robust, though clownish, they make good soldiers. They have several manufacturies in the town; but one of the chief employments of the people is spinning wool and flax; and they are provided with an excellent institution for supplying the poor with these means of subsistence. This institution furnishes all who choose to apply with the materials, and they are paid for their labour on the same terms with those of the manufacturies; and yet, what arises from the sale of the yarn and thread, is sufficient to defray all the expenses of the establishment. Adults perform this work at their own habits; but 200 children work every day in the house, and are there also instructed in reading and writing. The first spinning wheels are said to have been invented in this place in 1530, by a flatuany, named Jurgen. The strong beer of Brunswick, called "Mum," after the name of its inventor, Christian Mammken, is exported to various parts of Europe, and even Asia. Brunswick has two considerable fairs every year.

Brunswick appears to have been in being so early as the 8th century. In 775, it is said, that the emperor Charles the Great came to the Ocker, which runs through "Brunonis vicum," or Brunswick; and it is also related, that in the beginning of the 8th century, bishop Swibert with his train of followers went to Saxony, and coming to a large town called Brunswick, preached there, and converted great numbers. Hence, it has been thought not improbable, that the place was founded by duke Bruno, fon-in-law to duke Wittkind, if not by his father duke of Enjern. Bruno I. margrave of Saxony, is said to have enlarged and embellished this city A.D. 955. In the time of Henry the Lion, it consisted of five precincts, within its separate wall; but this duke, in 1177, included them all within one wall. In 1314, the burghers of Brunswick were discharged from all kinds of villanage; and in 1345, the citizens by mortgage acquired the government of the town, and arrogated other immunities, which were the occasion of fierce and tedious contests between them and the duke. At length, in 1671, duke Rudolphus Augustus made himself master of the town after a long siege, by means of the cannon which had been lent him by the inhabitants for another purpose; and he erected a citadel to secure his subjection. In 1757, it was taken by the French, but evacuated in the following year: and an unsuccessful attempt was made against it in 1761. Brunswick is distant 7 miles N. of Wolfenbuttel; in N. lat. 52° 15', 47'. L. long. 10° 35'.

**BRUNSWICK, FAMILY OF, in History.** This ancient and illustrious house is descended from the marquis of Azo of Elle, who was proprietor of the Milanese, the state of Genoa, and several other countries in Lombardy. About the year 1040 he married Cunigunda, or Cuniza, heiress of the first Welfs, or Guelfs, earls of Altorf, in Sabis; and their son Welf, or Guelf, obtained the duchy of Bavaria of Henry IV. in 1071. His grandson, Henry, duke of Bavaria, acquired Brunswick along with Saxony. In 1195, William, son of Henry the Lion, and of Matilda, or Meide, elder daughter of king Henry II. of England, in whom was united the Anglo-Saxon and Norman blood, acquired Lunenburg; and his son Otto, in 1235, was the first duke of Brunswick and Lunenburg. His son, Albert I. in 1253, was named the Great. Magnus II. in 1268, was named Turquattus, from a large chain which he wore. His son, Bernard, retained Lunenburg; while Brunswick passed to Henry the second son, and continued in the line of his descendants till the year 1342. The dukes of Lunenburg acquired some small portions of adjacent territory. Henry being put to the ban of the empire, in 1521, was fac-
founded by his son, who only assumed the title of duke of Zell, a title which continued till the reign of George William, in 1665. In 1617, Christian, duke of Zell, obtained possession of Grabenhagen. In 1628, George William, Duke of Zell, confirmed that the electorate, instituted in favour of his family, should be conferred on his younger brother, as he had no male heir. Ernest di in 1639, having married Sophia, daughter of Elizabeth, daughter of James I. of England. He was succeeded by his son George Lewis, elector, in 1658, and king of England, in 1714, who, in 1715, added to his family the duchy of Brunswick, with the principality of Verden. In 1727, he was succeeded in the British throne and electorate by his only son, George Augustus, or George II., from whom, in 1709, they divided his grandsons, our present sovereign, George III.

Brunswick Lombarde, or Lombarde, is Geography, an electorate of Germany. The territories of which are chiefly situated in the circle of Lower Saxony, is frequently denominated, from its capital, the electorate of Hanover, which see. See also LUNEBURG.

Brunswick, Wolfenbuttel. See Duchy of Brunswick and Wolfenbuttel.

Brunswick, Kwen, a province in the northern part of Nova Scotia, according to the division of 1783, the other retaining the original name, lies on the north west of the bay of Fundy, and is bounded on the north by the north shores of this bay, and by the river Missiquash to its source, and from thence by a due east line to Verte bay, and on the west by a line running due north from the main source of St. Croix river, in Paffamaddoquay, to the high lands, which divide the streams that fall into the river St. Lawrence, and the bay of Fundy; and from thence by the southern boundary of the colony of Quebec, until it touches the sea-shore at the western extremity of the bay of Chaleur; then following the course of the sea-shore to the bay of Verte, in the limits of Northumberland, until it meets the termination of the eastern line, produced from the source of the Missiquash already mentioned, including all the islands within the said limits. The towns of this province are the capital Frederick-town, situated about 90 miles from the mouth of the river St. John; St. Ann’s almost opposite to it, St. Andrew’s and St. John’s, 18 miles, another town, near the mouth of the river St. John, was erected, under the appellation of New Brunswick, into the metropolis of the province so called. There are five other settlements near the bay of Fundy, with a fort called Howe. A tribe of savages, called the Marchites, inhabits this province, and they are estimated at 1,400 fighting men. It has two considerable bays, several lakes, among which the grand lake is 30 miles long and about 9 broad; and the chief rivers are St. John’s, Maggiepavie, or eastern river, Dickwell, St. Croix, Merrimack, Petticozanes, and Memram-Cook, all of which, except the three last, discharge themselves into Paffamaddoquay bay. St. John’s river is navigable for vessels of 50 tons about 60 miles, and for boats about 200; the tide flowing about 80. It opens into a vast extent of country, in which are rich vales and meadows under cultivation; and the upland is in general well timbered; the trees being pine and spruce, hemlock, and hard-wood, principally beech, birch, maple, and some oak. The pines on St. John’s river are the largest in British America, and afford a considerable supply of nails for the royal navy. The fish are salmon, bays, and tarpon. This river affords a common and near route to Quebec. The river St. Croix separates New Brunswick from the province of Maine, belonging to the United States. The rivers which fall into Paffamaddoquay bay have on their banks meadows and woods, and must formerly have been covered with a large growth of timber, as the remains of large trunks are still visible. The great chain of the Appalachian mountains parallels on the north-west of this province, probably terminating at the gulf of St. Lawrence. The chief products of this province are timber and fish. See NOVA SCOTIA.

Brunswick, a county of America, in Virginia, lying between Nottaway and Mecklenburg rivers; is about 38 miles long, and 33 broad, and contains 12,827 inhabitants, including 676 slaves.—Alto, a maritime county, in the district of Wilmington, North Carolina, containing 3074 inhabitants, of whom 1511 are slaves. This is the most southerly county of the state, having South Carolina on the south-west, and bounded by Cape Fear river on the east. Smithville is the seat of Justice.—Alto, the chief town in the above county, situated on the west side of Cape Fear river; and formerly the seat built in the whole state, and carrying on the most extensive trade. It lies about 17 miles S.W. of Wilmington, and was formerly the seat of government; but in 1780 it was conformed by the British forces, and has now only three or four houses, and an elegant church in ruins. N. lat. 34° 2’. W. long. 78° 12’.—Alto, a township in Essex county, Vermont, on the west bank of Connecticut river, opposite to Stratford, in New Hampshire.—Alto, a city in Middlesex county, New Jersey, situate on the south-west bank of Raritan river, in a low situation, under a hill rising to the west of the town. It has between 200 and 320 houses, and about 2550 inhabitants, one half of whom are of Dutch. This town has a considerable inland trade, and over the river, opposite to this city, is one of the most elegant and expensive bridges in America. It is 13 miles N. from Princeton, 63 N. from Philadelphia, and 35 S.W. from New York. N. lat. 40° 30’. W. long. 74° 50’.—Alto, a town of Cumberland county, in the district of Maine, lying 30 miles N.E. of Portland, and of Bolton 171, on the south side of Merry-meeting bay, and partly on the south-western side of Androscoggin river. It contains 1307 inhabitants; and is the seat of Bowdoin college. N. lat. 43° 52’. W. long. 69° 58’.—Alto, the chief town of Glynn county, in Georgia, situated at the mouth of the Turtle river, where it empties into St. Simon’s Sound, N. lat. 31° 10’. The harbour is safe and spacious enough to contain a large fleet. The town is regularly laid out, but not finished. From its advantageous situation, and the fertility of the back country, it promises to be one of the most commercial and flourishing places in the state. It is distant 19 miles S. of Darien, 62 S.W. of Savannah, and 110 S.E. of Louisville. N. lat. 31° 41’. W. long. 81° 45’.

Brunswick bay, one of the Hudson-bay company’s settlements, situate on Moose river, half way from its mouth; S.W. from James’s bay, and N.E. from Lake Superior. N. lat. 50° 13’. W. long. 83° 31’.

Brunswick green. Friesland green. This colour is largely used for the bluish greens of pepper-boxes, and other coarse kinds of painting in water colours. It is prepared in the following way. Take a barrel, or any other close vessel of wood or earthen ware, and fill it half full of filings or clippings of copper; then pour in a saturated solution of sal-ammoniac, sufficient to moisten the whole thoroughly: put on the cover of the vessel, and let it in a warm place. In a few hours the copper will begin to decompose the sal-ammoniac, and form murrit of copper, ammonium being at the same time disengaged. The murrit or oxyd absorbs a considerable quantity of moisture, on which account it is requisite from time to time to add fresh portions of dissolved sal-ammoniacs, till, in the course of a few weeks, nearly the whole of the copper is converted into oxyd. The contents of the barrel are
BRÚ

are now to be emptied and passed through a sieve in a tub of water, by which the unoxidized copper will be separated from the pigment, which will pass into the water. This being well washed, and dried in the shade, is pure Brûnluck green. Three parts nitrate of ammonia, and two of copper yield six parts of the green. It is rarely, however, that pure Brûnluck green is met with, as it is largely adulterated with ceruffle.

BRÚNTRUT, or BRÚNTRUT, in Geography. See PORENTRU.

BRÚNUS, in Biography, an Italian physician and surgeon of great name in his time, flourished in the early part of the 16th century, and is said to have been intimate with Petrarch. He was author of "Chirurgia Magna et Parva," published at Venice in 1440 in a collection of chirurgical treatises, fol. which has been several times reprinted. The Chirurgia is a compilation, taken from the Greek and Arabian physicians, principally from Albucasis, from whom he describes the operation of cutting for the stone in the bladder. In the middle of the ams he recommends opening the sinuses, without which, we cannot, he says, be certain of curing. Haller. D. Chirurg. Elyot Dist. Hist.

BRÚNSEE, a town of Germany, in the county of Stiria; 12 miles W. of Rackeburg.

BRÚSA, a town of Turkey, in Asia, built by Prusias, the friend of Hannibal. It is full extensive and populous, but the streets are narrow. Many houses are built so much against the hill, that the upper rooms open into the gardens. They reckon 70 mosques, but most of them are neglected, or absolutely in ruins. The police is excellent. The bezdzan is ample, and one of the khans is singularly commodious. The sale of raw and manufactured silk constitutes its commerce.

BRÚSA-SORE, in Biography. See Riccio.

BRÚSCH, in Geography, a river of France, which runs into the Rhine at Strasbourg. It forms a canal by means of sluices from Molsheim.

BRÜSCHIO, a town of Switzerland, in the Valteline, situated near a river which discharges itself into the Adda. N. lat. 48° 5': E. long. 10° 5'.

BRÜSCUS, in Boiainy, Ger. See Rusces.

BRÜSEGANNA, in Geography, a town of Italy, in the Padovan; 4 miles W. N. W. of Padua.

BRÜSCH, an embellishment of hogs or hogs' bristles, fastened in the holes of a wooden handle or board, pierced for that purpose, and serving to cleanse driers' bodies by rubbing therewith. Of brushes there are a round, a flat, or square brush, cloaths-brush, head-brush, horse-brush, beard-brush, comb-brush, weavers-brush, and the like. The manner of making brushes is, by folding the hair or bristle in two, and bringing it by means of a pack-thread, or wire, engaged in the fold, through the holes with the iron is pierced all over, or fastened therein with glue or pitch. When the holes are thus all filled, they cut the ends of the hair to make the surface even.

BRUSH, Painter's. See Pencil.

BRUSH, Shearmen's, is made of wild hogs' bristles, and serves to lay the wool or nap of cloth, after sheering it for the last time.

The fluff-brush is of use in medicine, especially in case of rheumatism, and certain cutaneous disorders. See Friction.

The brush is also applied to the soles of the feet of newborn infants, when fainting, to find whether they be alive or dead.

BRUSH, in Electricity, denotes the luminous appearance of the electric matter, issuing in a parcel of diverging rays, from a point. Beccaria ascribes this appearance to the force with which the electric fluid, going out of a point, divides the contiguous air, and pulls through it to that which is more remote. See Plate, Electricity. See Star.

BRUSHES, wires, are used by silver-smiths and gilders, for scratching silver, copper, or brass pieces, in order to the gilding of them.

There is a method of dying or colouring leather, performed by only rubbing the colour of the brush, with a brush. This the French leather-gilders called iron-ore; being the lowest of all the forms of dye allowed by their statutes.

Brush of a fox, among Sportsmen, signifies his drag or tail, the tip or end of which is called the shape.

Brush iron-ore, signifies a kind of ore full of fire, resembling the hair of a brush.

Brush is also used in speaking of a small thickets or coppice. In this sense, the word is formed from the middle age Latin broiice, brushes, which signifies the same.

Brush-word denotes smaller hinder wood or spry. See Browse.

BRUSHING. Among Turks, a brushing gallop denotes a brush one; a horse should have his brushing gallop in a morning before watering.

BRUSINSKOI, in Geography, an island of Rutil, in the lake of Onegskoe; 40 miles S. E. of Petrovskoi.

BRUSKAV, a town of Poland, in the faubric of Braslaw; 40 miles N. W. of Braslaw.

BRUSSEE, Island, lies on the coast of France, in the English channel, below the Seven Islands, and Leman haven and river.

BRUSQUET, Ls, a town of France, in the department of the Lower Alps, and district of Digne; 5 miles N. N. E. of Digne.

BRUSSELS, in Latin Bruxelle, in Flemish Brussel, a large and handsome town, annexed to France, being the chief place of the department de la Dyle. It was formerly the capital city of Brabant, and of the Austrian Netherlands, where the governor-general held his court with all the splendour of royalty. It is situated partly on a hill and partly in a vale, on the banks of the river Senne, which runs through the town. Various etymologies are given to the name of Brüssel: it has been derived from Brugge-Senne, bridge on the Senne; from Breslau, a city in Prussia; from Brussel, a city in England. It is highly probable that the ancient forest of Ardenus extended to this place; and that the present foret de Soigne was part of it. Brüssel was not existing in the 7th century. It owes its origin to a little inn formed by two branches of the river, on which St. Gery, or Gargerie, bishop of Cambrai, built a chapel and preached the gospel to the heathens who were feasted in the vicinity; he died in 619. In 1044, the town, being considerably enlarged, was fortified by a wall, and fortified with towers, by which traces are still remaining. A second, more extensive enclosure, took place in 1379, and now exists, but the town extends itself far beyond it, since many villages have become its suburbs, by a continuity of buildings and streets. Brussels is ornamented by many handsome public structures. The principal church is collegiate, dedicated to St. Guidule, and was built in 1043, but rebuilt between 1226 and 1273. The palace displays considerable taste and magnificence, and formerly contained one of the most beautiful chasels in Europe, which escaped the great conflagration in 1771, but was pulled down in 1777 to make way for the erection of the new square called Place Royale. The town-hall, or guild-hall, was built in 1442; it has a fleche 364 feet high, surmounted by a colossal statue, 17 feet high, of St. Michael with the dragon under...
Plutarch has a dialogue under this title, that brutes use reason (Op. vol. ii. p. 938.). The whole Pythagorean faith should also be of the same sentiment, because the metaphysical imports, that human souls pass into the bodies of brutes. The Stoics also holding that the Divine Being is diffused through all creatures, were necessitated to maintain the souls of brutes to be divine, and, consequently, that they had reason. Among Chaldeans, Lactantius, and the whole body of Manichees and Gnostics, assert the same. Can any person, says Lactantius (Inl. Div. ii. l. c. 10.), deny that brutes have reason, when they often outwit man himself? He allows every thing to brutes which men have, except a fene of religion. Some Sceptics have ascribed religion and virtue to brutes; and they say that Solomon (Ecclef. iii. 18, 19.) seems to affirm us, that the souls of men have no pre-eminence over those of brutes. Sextus Empiricus, in particular (Pyrrhon, l. i. c. 15.), infinuates a comparison between dogs and the human kind. The former exceed the latter as to fene; they have a quicker fcent, by which they pursue beasts that are unseen; they discover them sooner by the eye, and their hearing is more acute. Accordingly it is alleged, that a dog is not deftle of the faculty of reasoning, from the famous instance mentioned by Chrysippus, who observed that a hound coming into a road which separates into three directions, makes choice of the third by virtue of an induction or syphogymnion; because, after having fent in the two ways by which the beast did not pass, he runs straight upon the third without fentiing it; where the reason is obvious: the beast passed either that way, or that way, or this way; but he paffed neither that way nor that way, and therefore this way. See Stanley's Phil. Philof. p. 780. That a dog is posfefled of what they call internal reason, appears, from his choosing things convenient, flying the hurtful, purifying his food, and running away from the whip; and when wounded or fick, acting prudently, as the circumstances of his cafe, and his abilities and opportunities dictate. It has also been argued, though certainly with no great appearance of reason, that we owe the discovery of many medicines, and the invention of many arts, to brutes. Thus, it is faid, that from the fpidir man learned the art of weaving; from the fwhale he borrowed architecture; from the goose swimming, from fhip navigation; from silk-worms feeding; to omit many other inftances of the like kind alleged by Plutarch (De Solert. Animal. Op. tom. ii. p. 674.), Voldius (De Orig. Idol. l. iii. c. 27.), and others. How many actions of brutes, it is faid, are to be obferved, which cannot be accounted for without the fift proccfes of reasoning? If we fay, that dogs, by long habits and force of rewards and punishment, may be taught many things, do not this docility, and remembrance of blows, argue memory, fcare, and defire, which cannot fulfill without knowledge, fene, pleasure, and pain? And if brutes have knowledge, it is allowd that they muft also have judgment and reafon. Thus Carteians, on the other hand, maintain that brutes are mere machines, wholly deftle not only of reason and thought, but of every degree of perception: and that they perform their various functions as mere "automata," excited to motion only by means of animal spirits, which act upon the nerves and muscles. This extravagant and paradoxical opinion Des Cartes has been fubjefted of borrowing from Gomez Pereira, a Spanifh physician, who employed 30 years in composing a treatife, which he entitles "Antoniana Marginata," from the Christian names of his father and mother, published in 1554; but it is more probable, that it was a conclusion originally deduced from his notion of the animal spirits in the economy of human nature. However this be, the notion was revived by Des Cartes, and further affected by Le Grand, d'Armafon, and others of his followers, who were led to adopt this doctrine from

under his feet, which turning on a pivot, acts as a vase. The park in the upper town (anciently part of the forest de Soignes,) is a beautiful promenade, and has a public pleasure-garden in one of its groves. The green walk near the canal has a pleasing appearance, being two miles in length. Besides the place royal, Brussels is ornamented with seven squares or market-places. The principal are the great market, the place St. Michael, the corn-market, the petit fablon, and the grand fablon, where a beautiful fountain was erected by lord Aylebury. In this town are twenty public fountains, adorned with statues; &c. The most remarkable is the manueke pitt, on which is represented a child in brafs, which is to admirably executed, that it has excited the notice of many connoisfeurs, and particularly the elector palatine in 1648, and Lewis XV. In 1747. The population of Brussels is estimated at 90,000. In Tinfent's Statistical View of France, its four parts or cantons are represented as containing 66,297 inhabitants, and including 7½ kilometres, and one commune. It had formerly considerable trade in the manufacture of camlet and tapestry, which is now on the decline: but its lace is still in high estimation, as the most beautiful in the world. Its carpets are also noted all over Europe. This town has suffered frequently by war: it was bombarded in 1695 by marfchal Villeroi; and besieged, in 1708, by the elector of Bavaria, and in 1746, by marfchal Saxe. It was taken by the French in the summer of 1794. Charles II. king of England, and his brother the duke of York, made Brussels their occasional residence during the usurpation of Cromwell. This town has been given to many celebrated men: among others are, Daquenfoy, Vanhelmont, St. Almgodene, Breugh Champain, D'Artois, and other painters. Brussels is 21 miles S. of Antwerp, 26 S. E. of Ghent, and 141 N. by E. of Paris. N. lat. 49° 51'. E. long. 4° 58'.

BRUSSELS, ROGER of, in Biography. See VANDER WEYDE.

BRUSSOW, in Geography, a town of Germany, in the circle of Upper Saxony, and Ucker Mark of Brandenbourg; 12 miles N. E. of Pretzlow.

BRUSTEWALT POINT is situate in the Baltic sea; 3 leagues N. by W. from Koningburg deep, and 16 leagues N. E. by N. from Memel deep.

BRUSZILOW, a town of Poland, in the palatinate of Kio; 46 miles W. of Kio.

BRUTA, in Zoology, is the second order of animals in the Mammalia class, the character of which consists in having no fore teeth in either jaw. The genera of this class are, Brasylus, myristophaga, manis, chrysops, rhinoceros, elaphus, and intichus; which see.

BRUTE, or Beast, a term generally applied to quadrupeds, and also to other animals, and implying inferiority of intellect.

Among brutes, the monkey-kind, both in the external shape and internal structure, bear the nearest resemblance to man. In the monkey-kind, the highest and the most nearly approaching the likeness of man, is the orang-outang, or Homo syzyphus.

Philosophers are much divided about the essential characters of brutes. Some define brute as an animal not rible, or a living creature incapable of laughter; others, a mute animal, or a living thing delusive of speech; the Peripatetics, an animal endowed with a qualitative, but without a rational one. The Platonists allow reason and understanding, as well as fene, to brutes, though in a degree less pure and refined than that of men. Indeed, the generality of the ancient philosophers thought that brutes reasoned: this, among the heathens, was the opinion of Anaxagoras, Porphyry, Celsus, Galen, Plutarch, as well as Plato and others.
from that principle of his philosophy, that the essence of the soul consists in thinking; so that, supposing knowledge and thought in brutes, they must have souls like those of men; the sensitive soul of the Aristotelians being held by him a mere chimera. But Percivai does not appear to have been the first inventor of the doctrine: something like it having been held by some of the ancients, as we find from Plutarch (De Placeit. Phil. l. v. c. 20.), and St. Angolin (de Quant. Anima. Pasch. Invent. Nov. Antiq. c. 3.). Des Cartes was probably led to adopt this opinion of the mere mechanism of brutes in order to obviate two great objections; one against the immortality of the souls of brutes, if they were allowed to have any; and the other against the goodness of God, in suffering creatures who had never sinned to be obnoxious to so many evils. In favour of this opinion it has been argued, that many human actions are merely mechanical, being performed without the perception of the agent, and any direction from his will; and these must be ascribed to the impression of objects, and the original disposition of the machine, in which the influence of the soul has no concern: so that in such circumstances often occurring with regard to actions that are habitual, human beings are no better than automata.

2. Some natural movements of the body are involuntary, that we cannot restrain them, and seem to depend altogether on mechanism. 3. To this mechanism we are also to attribute those likings and antipathies for and against particular objects, which precede knowledge and discrimination, and which are advanced life baffle and counter reason; and they furnish striking proofs of that irresistible influence with which certain objects have on the human frame.

4. Our passions are known to depend on the motion of the blood, and are regulated by the animal spirits between the heart and brain, that are intimately connected by their nerves; and hence it is inferred, that if effects of this kind may be produced by such simple mechanical means as the mere increase of motion in the blood, without any direction of the will, we need not wonder that the actions of brutes should result merely from a refined mechanism, without thought or perception.

5. It has been further urged, that human ingenuity has produced many surprising phenomena by mechanical means, such as are exhibited in automata of human contrivances; and as the mechanism of the body of the meanest animals is infinitely surpass'd that of the most curious machines of this nature, the effects produced by it must be proportionably more surprising. In reply to these arguments, it has been alleged, that they only prove, if we allow their full force, the possibility of the case, that brutes are mere machines, or that the power of God might produce certain actions by mechanism, Uris not that he has actually done so; and, moreover, that if they are admitted, they will prove too much, or that human beings may be mere machines, and not only irrational but insensible too. To the Cartesian hypothesis it has been more directly objected, that the phenomena of perception, foresight, memory, volition, and spontaneous exertion, and of various passions of joy, sorrow, fear, anger, gratitude, love, &c. exhibited by brutes, are inexplicable by any mechanical principles and laws. We have the fame evidence in many cases of the sensibility of brutes when we have of that of mankind; and that they are also endowed with the powers of reflection and reasoning, as well as with affection.

If beasts were automata or machines, they could have no perception of pleasure or pain, and consequently no quality could be exercised towards them; which is contrary to the common sense and observation of mankind, and seemingly contrary to those declarations of scripture, which obviously intimate that they are the objects of severe and of mild and merciful treatment. Prov. xii. 10. Ray's Wisdom of God in the Creation, p. 59.

The late professor Bergmann, in an ingenious treatise, written in German, and entitled "Inaugural disc., &c." or "Researches designed to shew what the brute animals certainly are not, and, also, what they probably are, &c." 8vo. Mentz, 1785, has produced a variety of arguments in order to prove that brutes are not machines. But if they are not mere machines, what are they? manifestly, sentient beings, with an immaterial principle; and thinking, or reasoning beings, to a certain degree. In certain classes of animals this appears evident to the professor, who seems to have observed, with great sagacity and attention, their various operations and proceedings, their ways and means, &c. He thinks it impossible to deduce this variety of actions in any animals (if we except those of the lowest classes in the gradation of intelligence) from a general and uniform instinct; for they accommodate their operations to times and circumstances. They combine; they choose the favourable moment; they avail themselves of the occasion; and seem to receive instruction by experience. Many of their operations announce reflection: the bird repays a shattered nest, instead of constructing, instinctively, a new one; the hen, who has been robbed of her eggs, changes her place, in order to lay the remainder with more security: the cat discovers both care and artifice in concealing her kittens. Again, it is evident, that, on many occasions, animals know their faults and mistakes, and correct them: they sometimes contrive the most ingenious methods of obtaining their ends, and when one method fails, have recourse to another; and they have, without doubt, a kind of language for the mutual communication of their ideas. How is all this to be accounted for (says Bergmann) unless we suppose them endowed with the power of perceiving, thinking, remembering, comparing, and judging? They have these powers, indeed, in a degree, inferior to that in which they are possessed by the human species, and form classes below them in the graduated scale of intelligent beings. But though it seems to him unreasonable to exclude them from the place which the principles of found philosophy, and facts ascertained by constant observation, assign to them in the great and diversified sphere of life, sensation, and intelligence; he does not, however, consider them as beings, whose actions are directed to moral ends, nor, consequently, as accountable and proper subjects for reward or punishment in a futur world.

That brutes possess reflection and sentiment, and are susceptible of the kind as well as the irascible passions, independently of sexual attachment and natural affection, is evident from the numerous influences of affection and gratitude daily observable in different animals, particularly the dog. Of these, and other sentiments, such as pride, and even a sense of glory, the elephant exhibits proofs equally surprising and unquestionable; for which we refer to the article Elephant. The brute creation manifests also a wonderful spirit of sociality, independent of sexual attachment. It is well known that horses, which are perfectly quiet in company, cannot be kept by any fences in a field by themselves; oxen and cows will not fatten by themselves, but neglect the finest pasture that is not recommended by society; sheep constantly flock together. Nor is a propensity to associate restricted to animals of the same kind and size. Influences to this purpose are enumerated in White's Natural History of Selborne, to which we refer the reader. From these influences we may conclude that Milton, when he puts the following sentiment in the mouth of Adam, seems to have been mistaken:

"Much less can bird with beall, or fish with fowl"

So well convert, nor with the ox the ape."
Mr. Locke (Essay, vol. i. p. 120, 145.) maintains, that
the souls of brutes are wholly material; that they do not
possess the power of abstraction; and that the having of
general ideas is that which puts a perfect distinction between
men and brutes. Accordingly, he supposes, that they have
no use of words, or any general sign by which to express
their ideas. It has, however, been a subject of dispute,
whether brute animals have any language intelligible to one
another. Some have pretended, that they have a kind of
language, by which they can make a mutual communication
of their sentiments; and Porphyry relates, that Tiresias and
Apollonius Tyaneus understood this language. There is at
least a similitude of speech in brutes; for they know each
other by their voices, and have their signs whereby they ex-
spress anger, joy, and other passions. Thus, a dog affrights
in one strain, gaws in another, howls in another, and cries
when beaten in another. To us, indeed, their speech, if it
may be so called, appears rude and inarticulate; but perhaps
ours, though understood by them, is the same in their ears.
But if the voice of brutes be unintelligible to us, does not
the same hold of the language of our own kind, till we have
been instructed in it? And the language of foreigners, what
is it but a confused meaningless heap of sounds? Laughter,
as the sign of mirth and joy, has been thought peculiar to
men; and yet we fee somewhat resembling it in brutes,
figured by the motion of their ears, eyes, mouth, and tongues.

Dr. Hartley (see his Observations on Man, p. 239.) has
investigated the intellectual faculties of brutes, and applied
his theory of vibrations and association in accounting for the
inferiority of brutes to mankind, with regard to intellectual
capacities. He abridges the difference existing between
them to the following circumstances, which he has taken
occasion to illustrate on the principles of his theory.
The first of these is the small proportion of size of their
brains, whence brutes have a far less variety of ideas and intel-
lectual affections than men. The second cause of this difference
is the imperfectitude of the matter of their brains, whereby it is
less fitted for retaining a large number of miniatures, and
combining them by association, than man’s. The third
cause is their want of words, and such like symbols; fourthly,
the instinctive powers which they bring into the world with
them, or which rise up from internal causes, as they advance
towards adult age, is another cause of this difference; and,
fifthly, it is partly owing to the difference between the
external impressions made on the brute creation, and on man-
cide. This ingenious writer supposes, with Des Cartes, that
all the motions of brutes are conducted by mere mechanism;
yet he does not suppute them to be deficient of perception;
but that they have this in a manner analogous to that which
takes place in us; and that it is subjected to the same me-
chanical laws as the motions. He adds, that it ought always
to be remembered, in speaking on this subject, that brutes
have more reason than they can show, from their want of
words, from our inattention, and from our ignorance of the
import of those symbols, which they do use in giving insti-
tutions to one another, and to us.

"As brutes," says Dr. Priestley (Disquisitions on Matter
and Spirit, p. 238, &c.) "have the fame external senso\ns that we have, they have, of course, all the same innate ideas
to which we have; and though, on account of their wanting a
sufficient quantity of brain, perhaps chiefly, the combination
and association of their ideas cannot be so complex as ours,
and therefore they cannot make so great a progress in intel-
lectual improvements, they must necessarily have, in kind,
every faculty that we are possessed of. Also, since they evi-
dently have memory, passions, will, and judgment too, as
their actions demonstrate, they must, of course, have the
faculty that we call abstraction, as well as the rest; though,
not having the use of words, they cannot communicate their
ideas to us. They must, at least, have a natural capacity for
what is called abstraction; it being nothing more than a par-
cular use of the association of ideas, of which, in general,
they are certainly possessed as well as ourselves. Besides, if
dogs had no general or abstract ideas, but only such as were
appropriated to particular individual objects, they could never
be taught to distinguish a man such as, a hare as such, or
a partridge such as, &c. But their actions shew, that they
may be trained to catch hares, set partridges, or birds in
general, and even attack men, as well as to distinguish
their own master, and the servants of the family in which
they live. Whether brutes will survive the grave we cannot
tell. This depends upon other considerations than their being
able of reason and reflection. If the resurrection be properly
miraculous, and entirely out of all the established laws of
nature, it will appear probable that brutes have no share in
it; since we know of no declaration that God has made to
that purpose, and they can have no expectation of any such
thing. But if the resurrection be, in fact, within the proper
course of nature, extensively considered, and consequently
there be something remaining of every organized body that
death does not destroy, there will be reason to conclude
that they will be benefited by it as well as ourselves. And the
great misery to which some of them are exposed in this life
may incline us to think, that a merciful and just God will
make them some recompense for it hereafter. He is their
maker and father as well as ours. But with respect to this
question, we have no sufficient data from which to argue,
and therefore must acquiesce in our utter ignorance, satisfied
that the maker and judge of all will do what is right."
fairly interpreted, does not imply that brutes have reason and reflection, but may be understood of that natural instinct common to man and brutes, by which they are impelled to self-defence, propagation of their species, &c.

We shall close this article with briefly noticing the fanciful opinion of father Bouganet, who has laboured to prove, both from reason and scripture, that the spirits of brute creatures are devils. As so many guilty victims of divine vengeance, they are sentenced to endure a variety of evils. By nature, he says, they are extremely vicious; but God, by irreconcilably repudiating them, has, at the same time, divested them of their liberty, so that they can be no longer criminal: an hypothesis equally absurd in its principles and in its consequences.

BRUTIA, in Entomology, a species of Mutilla that inhabits Calabria. Its character is thus described: colour black; thorax rufous; abdomen with six filigrave white spots, and belt of the same. Pctagn. Inf. Cal.

BRUTIA, in the Medical Writings of the Ancients, a term used to denote the fittest and most reinosus kinds of pitch, and such was the most proper for making the oil of pitch, called "oleum piceum." The term is derived from Brutia, or Brutum, the name of the country where it was procured. Plin. N. H. l. xv. c. 7.

BRUTIAN FORSET, in Ancient Geography, now called La Silva, an extensive forest of Brutium or Calabria, which covered a surface of 400 miles in circumference; and from which Hiero, king of Syracuse, and after him the Romans, drew their masts and other timber for shipping. The fame forest is still covered with large woods of pines or firs; but from these extensive woods little benefit is derived, except in turpentine and fuel.

BRUTIUM, one of the two peninsulas of that part of Italy, anciently known by the name of Magna Græcia, which extended to the fronts that separated Sicily from Italy; the other peninsula being called Calabria. Part of it towards the north is now distinguished by the appellation of Calabria Citra, and the more southerly part is designated Calabria Ultra. It was inhabited by the Bruttii, who were slaves of Lucania, that had revolted from their masters, taken up arms, and rendered themselves independent. Some derive their name from a Lucanian term, denoting "Rebels:" but others with greater probability seek the etymology of their name in the nature and productions of their soil. Accordingly, as most of their trees were reinosus, they find in the oriental term "Brata," or as the Syrians write it "Bruta," the origin of the appellation Bruttii. Calabria, it is likewise alleged, has a similar derivation from "Calab." signifying pitch or rein. Their principal rivers were, on the west, Lamatis and Metamus, and on the east, Cæmus, Targines, Neochor and Cratis. Their chief towns, in the west, from north to south, were Pandoria, Conventia, Hippynus, and Rhegium; and, on the east, from south to north, Loeri, Sylacum, Croton, Petilia, and Rosciacium. The "Bruttium promontorium" was that promontory since called "Cabo de Seillo."

BRUTO, JôHN-MICHAEL, in Biography, a polite Italian scholar, was born at Venice about the year 1515; and in the course of his vagrant life, he resided for some time at Padua, afterwards visited Florence, Lucca, and other Italian cities, passed some years at Lyons in France, and travelled into England and Spain. In 1574 he accepted an invitation from Stephen Bocarti, prince of Transylvania, by whom he was employed in writing the history of that country; and after his advancement to the crown of Poland, accompanied him to Cracow. On the death of this prince, he removed to Vienna, and became historiographer to the emperor Rudolph II. He closed a wandering life, in the course of which, notwithstanding the patronage he enjoyed, he never rose above indigence, in Transylvania in 1594. As a writer, he had the reputation of learning and merit; and, though he contended the affection of the Cisromians, his Latinity was pure and elegant. His critical works comprised notes on Horace, Cæsar, and Cicero; but his historical writings are the most valuable. His Florentine history, extending to the death of Lorenzo de Medici, is considered as one of the finest monuments of the age. It was printed at Lyons in 1652, under the title of "Florentia Historia, libri viii. priorum." As it was confinable to the political conduct of the house of Medici, it was industriously suppressed, and few copies of it now remain. His elegant tract "De Origine Venetiarum," his treatise "De Inflauratione Italica," and his "History of Hungary," are preferred in the imperial library at Vienna. Of his smaller printed works, comprising orations, Latin letters, and two treatises, one on the manner of studying history, and the other containing conjugal precepts, a new edition was printed at Berlin in 1698, 8vo. Bayle. Tiraboschi.

BRUTOBRIA, or BRUTOPOLES, in Ancient Geography, a town of Spain in Baetica, situate between the river Buitte, and the country of the Tyritani or Tuttitani. Steph. Byz.

BRUTON, or BREWTON, in Geography, is a pleasant, well-built market-town in Somersetshire, England, situated 113 miles W. from London, and 12 S. from Frome, at the western extremity of the forest of Selwood, and takes its name from the river Brew or Brue, which rising in that forest, passes through the town in its way to Glastonbury. The surrounding country is extremely interesting: the vale are meadows, the declivities orchards, and the eminences sheep-walks. The manor was once the property of Sir Maurice Berkeley, whose younger son John, as a reward for his services to the royal cause, was created by Charles II. lord Berkeley of Stratton. The title became extinct in 1773, and the manor is now in the possession of Sir Richard Colt Hoare, bart. of Stourhead in Wiltshire. On this site was an ancient abbey, founded by St. Algar, earl of Cornwall. The town confits principally of five streets, in the center of which is the market-place, where, till lately, floated a curious old hexagonal market cross, supported by five pillars at the angles, and a larger one in the center. The roof confined wholly of the ribs of arches, which diverged from pillar to pillar, and were finely ornamented with sculpture. This edifice was eighteen feet high, the top flat, and encompased with a stone balustrade: it was built, as Leland informs us, by John Ely, the last abbot of Brewton. The market is on Saturday. In the High-street is a market-house, built by a subscription of the farmers who frequented this market, upon land given them for that purpose by Hugh Saxey, eq. who, from a low station, was advanced to the post of auditor to queen Elizabeth. He died in 1620, possessed of several manors and estates in the counties of Somerset and Gloucester; which, in conformity to his intention, were settled in 1638 on twelve gentlemen of the county for the erection and endowment of a hospital here for the maintenance of old men, women, and boys. The number now supported are eight men, ten women, and twelve boys: the latter are boarded, educated, and apprenticed; and the aged are comfortably provided for. The annual income belonging to this charity is about £200. In the court of the hospital is a statue of the founder, with this inscription:--"Hugh Saxey, eq. founder of this hospital, auditor to queen Elizabeth, and king James." There is also a free-school in the town, instituted by king Edu-
ward VI. and endowed by bishop Fitzjames, and his brother Sir John, lord chief justice. Brutus had a noble family of 333 houses, containing 1631 inhabitants, the greater part of whom are employed in agriculture; for though Leland tells us, that in his time "Brewton was much occupied with making of cloth," yet at present the only manufacture is a little hofery, and silk reeling, at the latter of which three or four hands of young persons are employed. The church, dedicated to St. Mary, is a large structure, and has two quadrangular towers, one occupying the well end, and the other rising from one side of the north aisle. The latter seems to have been the original tower, but the former is the handfomeft. The interior of the church is well ornamented, and contains a great number of monuments. Collinson's History of Somersetshire, vol. i. 410. Maton's Tour through the Western Counties, vol. ii. 506.

BRUTUS, or Brutus, in Biography, the first king of Britain, according to the fabulous relation of Jeffry or Geoffrey of Monmouth. See BRITAIN.  

BRUTUS, Lucius Junius, the founder of the Roman republic, was the son of Marcus Junius, a wealthy patrician, who had married the daughter of Tarquin the Proud, with whom terminated the race of kings at Rome. The father and brother of Brutus were alienated from order of this tyrant at the beginning of his reign; and Brutus himself escaped by feigning idiocy, whence it is said the name of "Brutos" was derived. Under this character he was admitted into the royal palace, brought up with the king's sons, and regarded merely as the object of their divertion. On occasion of a plague which broke out at Rome, Tarquin sent his sons to consult the oracle of Delphi as to the cause and cure of the contagion; and Brutus also was ordered to accompany them for their amusement. The princes prepared magnificent presents for Apollo; but their companion was said to have offered to the god an elder fuck, en- closing a rod of gold, and serving as an emblem of himself. It is further reported, that when the princes made an enquiry, which of them should be king of Rome, the oracle replied, that the government should be reserved for him who should first kill his mother; and that they, interpreting this answer literally, agreed to kill their mother at the fame time, and to reign jointly. But Brutus, interpreting the response of the oracle allegorically, fell down upon the earth, after his return to Italy, and killed it, as the common mother of all mankind. Whatever may be thought of this story, it is certain, that the tragical death of Lucretia (see Lucre- tia) roused the dormant and digested spirit of Brutus; and that, having scratched the poignard out of her bosom, he vowed vengeance on the aggressors, and excited her relations to concure with him in retaliating on Tarquin and his family the dishonour she had suffered, and the lamentable event in which it had terminated. Accordingly they all bound themselves by a solemn oath to execute their purpose, and agreed to follow the counsel and example of Brutus, who seemed now, by a kind of extraordinary inspiration, to have recovered his faculties, and to possess talents, which had hitherto been concealed, fit for conducting their deliberations, and securing their prosperoufs life. The gates were immediately shut, the senate was assembled, and a public decree was proposed and carried for banishing the king, annihilating the royal form of government, and establishing a commonwealth. Brutus, and Collatinus, the husband of Lucretia, were elected as the first chief magistrates of the state, under the denomination of "consuls," an important change in the constitution of the Roman government, which took place in the year of Rome 245, B.C. 506. This change, so hastily concerted and accomplished, although it had obtained the concurrence of the senate, and of the people, excited an alarm amongst those who were attached to the old constitution, and particularly among the young nobility, who were zealous partizans of the dethroned and expelled sovereign. In the number of the malcontents, were the two sons of Brutus, and three nephews of Collatinus. These were active in the conspiracy formed against the new government; and they concurred with others in binding themselves by a very solemn oath to murder the consuls, and to re-establish monarchy. Willill they were conceiving motives for this purpose, the plot was disclosed by a slave to P. Valerius, a patriotic senator, and orders were given for apprehending them. When the sons of Brutus, venerated by the people as their deliverer, appeared before the con- fusion tribunal, the attendent multitude was seized with a general panic; and as soon as they were convicted of the crime alleged against them, the senators, in a kind of confounded murmur, expressed their anxiety and wishes, by uttering the words, "Banish them! banish them!" Collatinius wept, and the stern patriot Valerius was silent. But the father, sacrificing personal feelings to the public good, and apprized of the necessity of suppressing rebellion by an awful example of punishment, with a steady countenance, and firm tone of voice, gave orders to the lictors to execute the law on his sons. The diftrefs of the assembled multitude on this solemn occasion was such as no words can de- scribe; mournful looks and secret groans pleaded for pity; and when the confni seemed to pay no regard to their anxiety and tears, they loudly remonstrated, and exclaimed with one voice, "We give them back to their country, and to their family." Neither the intercessions of the people, nor the plaintive cries of the criminals, could alter the fixed purpoae of Brutus, who witnessed the execution of the sentence; and having seen them stripped, beaten with rods, and beheaded, retired from the tribunal, to indulge, without doubt, those parental feelings which the necessity of the times had induced him to disguise and refrain. Of his conduct on this occasion very different sentiments have been entertained. Whilst some have extolled, others have condemned it. But to the judgment of sober reason, it exhibits a noble example of the triumph of public virtue over private aecceptions; and the display of it required that temper of temper, and those peculiar ideas of the extent of parental authority, which seem to have characterized this ancient Roman. Collatinus was more flexible; and he wished to spare his nephews, and to suppress the evidence which the slave Vinicius had adduced against them. The zeal of Valerius was roused; and whilst the people were tumultuous, Brutus returned, and having again ascended the tribunal, justified his own conduct, but referred the fate of the other criminals to the decision of the people, who concurred in condemning them, and ordering them for execution. Collatinus, however, accused by Brutus for his weakness, and want of patriotism, was obliged to renounce his authority, and to retire to Lavinium, where he lived privately to an advanced age. Upon his removal, Brutus, in order to obviate every suspicion that it was his intention to govern fignly, convoked the people by centuries in the Campus Martius, for the election of a new confunl; and Valerius, afterwards known by the name of "Poplicola," whose meritorious conduct in the discloure of the conspiracy has been already mentioned, was chosen to supply the vacancy. Some difference occurs in the relation of these events by Dionysius of Halicarnassus, Livy, and Plutarch; but they all agree in the principal fact, respecting the con- duct of Brutus towards his sons. During the confunlate of Brutus and Valerius, Tarquin and his partizans made some vigorous
vigorouso effots for regainino the throne of Rome; and, joined by the Veientes, the avowed enemies of the Romans, they advanced towards the city. But they were met by the confuls at the head of the Roman forces; the command of the horse being assumed by Brutus, and that of the infantry by Valerius; the horse of the enemy, commanded by Arunx, one of Tarquin's sons, came forward to the charge; and as the hostile armies approached each other, Arunx discovered Brutus, attended by his lictors; and inflamed with resentment, he exclaimed, "There is the enemy of my family, the usurper of my father's throne." He then immediately advanced to a personal encounter, and Brutus flew to meet him. Actuated by passion, more than by cool courage, these two champions, neglecting the means of personal defence, transfixed each other with their spears, and at the same instant fell dead from their horses. This happened in the year B.C. 50. The conflict, thus commenced, terminated in a victory on the part of the Romans; and, as soon as it was decided, Valerius buried his colleague Brutus with great pomp, and gave Rome the first example of those funeral orations, which it was afterwards customary to pronounce in commendation of their great men. The Roman matrons distingiuished themselves on this occasion; for, regarding Brutus as the avenger of the honour of their sex, they mourned for him a whole year; and his statue was afterwards erected in the capital, with a naked sword in his hand. The Romans venerated his memory, as that of the second founder of their city, who had restored liberty to their country, cemented it by the blood of his own sons, and died in defending it against an usurper; and they considered him as having undergone more hardships and dangers in establishing the commonwealth, than Romulus had done in first founding the kingdom. Virgil has nobly sketched his history and praise in the following lines:

"Confus imperium hic primus saxaque secures
Accipiet: natoque pater, nova bella moventes,
Ad pamen pulchra pro libertate vocabit.
Infelix! uetiumque serent ea facta minores;
Vincit amor patriae, laudumque immena cupido."

Æn. VI. 820.

"He first shall hold the conful's sway, and wield
The dreaded axes; he, a Roman sire,
For thee, fair Liberty! his rebel foes
Shall doom to public death. Unhappy man!
How'er pitioufly the deed may judge,
His country's love, and boundless thirst of praise,
Shall quell the father."

BRUTUS, M. C. JUNIUS, an illustrious Roman, derived his name and descent, as some have said, as well as his spirit, from L. J. Brutus, the subject of the preceding article. Cicero records this line of his descent, both in his speeches and writings, as a fact, which was not doubted by any; and he often speaks of the "image of old Brutus," which Marcus kept in his house among those of his ancestors; and Atticus, who was peculiarly curious in the antiquities of the Roman families, drew up Brutus's genealogy for him; and deduced his sucession from that ancient hero, in a direct line, through all the intermediate ages from father to son. Plutarch also, on the authority of Pofidonius the philosopher, was of the same opinion. Other ancient writers, however, and particularly Dionysius of Halicarnassus, allege several arguments against this descent, which seem to be very plausible; and they lay that the family of the patriot was extinct in the execution of his two sons. However this be, M. J. Brutus was the son of a senator of the same name, who belonged to the party of Marius, and who was put to death for his feverities by Pompey at the surrender of Mutine. His mother was Servilia, the sister of Cato, who disgraced herself by her connexion with Cesar, which gave rise to the opinion that Brutus was his natural son. But as he was born in the consulship of L. Cornelius Cinna III. and Cn. Papirius Carbo I. A. U. 668, he was no more than 15 years younger than Cesar himself; and this circumstance fully confutes the vulgar story of his being commonly believed to be Cesar's son. As Brutus lost his father, when he was young, the care of his education devolved on his uncle Cato; under whose direction it was conducted on that liberal plan which prevailed among Romans of distinction, after their connection with Greece. He studied the language and philosophy of that country; and he acquired, by means of his natural talents and diligent application, a distinguished reputation for eloquence. At the bar and in private assemblies his rhetorical powers were exercised; he pleaded several causes of great importance, and he was allowed to be the most eloquent and learned of all the young men of rank and family at the period in which he lived. His manner of speaking was correct, elegant, and judicious; though he wanted that force and copiousness which are required in a consummate orator. But he was principally delighted with the study of philosophy, in which, though he professed himself a disciple of the moderate sect of the old academy, he nevertheless, from a certain pride and gravity of temper, and from a deference to the example of Cato, affected the severity of the Stoic. His disposition, however, which was mild, gentle, and compassionate, was incompatible with this system; and he was often constrained, by the tenderness of his nature, to confute the rigour of his principles. On the doctrines of the philosophy which he had adopted, he wrote some treatises, and he transfigured both the language and sentiments of his sect into Latin. His accomplishments as a scholar and an orator are sufficiently attested by Cicero, who has done him the honour of introducing him as one of his speakers in his dialogue "De Claris Oratoribus," and addressed to him his treatise entitled "Orator." Attached to Cato from his youth, he imbibed, under his discipline, an ardent love of liberty and virtue; and having accompanied him in his expedition to Cyprus, where he was employed by his uncle, after the unhappy end of its king, Ptolemy, in securing the royal treasures for the public. This commission he executed to the satisfaction of his uncle; and by marrying his daughter Portia, he formed a closer alliance with this venerable patriot, and was led to make him the model of his public conduct. Accordingly, after his example, when the civil war broke out between Cesar and Pompey, he joined the party of the latter; although he had reason to regret his conduct for the murder of his father; and Cesar's familiarity with his mother induced him to manifest a partiality in favour of her son. At the battle of Pharsalia, in which Brutus was engaged on the side of Pompey, Cesar gave special orders to find out and preserve him unharmed; and after this battle, which terminated the republic, he surrendered himself to Cesar, who rejoiced in his safety, and immediately received him into favour, testifying his regard for him by pardoning his friend Caius at his intercession. Cesar entrusted him with the government of Cisalpine Gaul, and afterwards nominated him pretor of Rome. Notwithstanding the gratitude and respect he was thus induced to entertain for Cesar, he was alarmed by his usurped dominion, and a view of the degraded state into which his country was reduced by the violation of the laws and constitution, excited a disgust which no favours could compensate. At the same time, Caius, who had married his sister, was affluent in endea-
BRUTUS.

mindful to kindle the flame of patriotism in his breast. He
cautiously handed on his sanguine, 
Julius Brutus,
the Roman history, and led him to believe that the
Romans expected his affirming the heretical office of ref-
cusing him from a senator. Their arguments at length pre-
ved, and Brutus agreed to take the lead in a conspiracy
against Caesar’s life. His character induced several other
Roman senators to join in the design; and they resolved
to execute it on the 2d of March (March 15) B.C. 44.

It is said, that when Cicero saw his beloved
Brutus among the conspirators, with his dagger drawn
against him, he delibed from any further self-defence,
wrapped his h. in his mantle, and surrendered himself to
his fate. 

Avenged from his colleagues, Brutus, by impious
forbearance, permitted Antony to escape; and by
retribution to the laments of Caesar’s will, by the
pompous solemnities of his funeral, he furnished Antony
with a pretext for exciting the minds of the people to a
revenge for his memory, and a detestation against
his murderers; in consequence of which he and his party
were obliged to secure their lives by retiring from Rome to

Afterwards, when Octavius joined Antony, and
they concurred in affirming the sovereign power, he and his
faithful Parthia quitted Italy, and set sail for Athens. Here,
by convenient intervals, he renewed the prosecution of his
philosophical studies; whilst at the same time he secretly
prepared for war, and sent a messenger to Macedonia, to en-
courage the Romans of that province in the party of the
republic, and to facilitate his admittance into it as governor for
the senate. Having obtained a complete supply of men, arms,
and money, he marched into Macedonia; and gained suffi-
cient of the army, and of the persons, of Caius, the brother
of Antony, who had been deputed to seize Dymecium
and Apollonia.

When Octavius became sole master of Rome, he pro-
ceeded to the condemnation of all who had been concerned
in the murder of his adopted father; and the names of
Brutus and Cassius were enrolled, much to the regret and
grief of the people, in the bloody roll of proscription.

They, however, were at this time in the command of powerful
armies, which speedily formed a junction at Smyrna.
Having performed some separative services in the subjugation
of those maritime powers, the Rhodians and Lydians, they
met again at Sardis; and determined to direct their march to
the frontiers of Hellespont, in order to pass over into Europe,
for the purpose of opposing the progress of Antony and Oc-
tavius, who had now arrived at Macedon. It was in the
course of this march that the frightful apparition, recorded
by Plutarch and other historians, presented itself to Brutus,
and which, under the appellation of his evil genius, an-
nounced another visit to him at Philippi. Cassius ascribes
this phenomenon to the illusion of a troubled imagination,
under the influence of anxiety and bodily fatigue; and if it be
ting more than an idle fabrication, to this cause it may be
reasonably attributed. On the plains of Philippi
the hostile armies assembled for the decision of the inte-
rating conflict. Brutus and Cassius having settled their plan
of conduct, if the issue of this conflict should prove unfa-
vourable, they prepared for action. In the first battle
Brutus defeated Octavius, but in the armor of the con-
tell he lost Cassius unsupported, and thus occasioned his de-
fay and death. This event he grciously deplored, and
shedding many tears over the body of his friend, bewailed
the loss of him under the honourable appellation of “the
laft of the Romans.” He had now the sole command of
a numerous and mutinous army; which compelled him to rift
another engagement, having first put to death all the lives

whom he had made prisoners, and having promiscd to
his soldiers, in case of victory, the pillage of Chersonesia and
Lacedaemon. In the second battle the wing of the
army which he commanded routed that of Octavius, while Antony de-
feated the other committed to the conduct of Cassius’s unit-
tant. But, instead of pursuing this advantage by follow-
ing the fugitives, this experienced general availed himself of
it by turning round on the rear of Brutus, and entirely
breaking and dispersing his troops. Brutus having escaped
being made prisoner by the heroic friendship of Lucilius,
who surrendered himself under the name of Brutus, and who
was generously favored by Antony after the discovery of the
fraud, fled with a few friends to a retired valley, where he
spent an anxious night. With the returning dawn, he per-
ceived that he was surrounded by the enemy, and conjured
some of his dependants to put an end to his life. Upon their
refusal, he dismissed them with a request that they would
provide for their own safety; and he then renewed his app-
clication to Strato, an Episcopi, and his former fellow stu-
dent; but Strato perished in his denial, till Brutus called
upon a slave to perform the fatal office. Upon this the

terous Greek exclaimed, “Forsake it, Gods, that it
should ever be said, that Brutus died by the hand of a
slave for want of a friend!” and covering his face with his left

hand, presented with his right his sword, upon which Brutus
threw himself with such violence that it pierced through
his body, and he instantly expired. Thus perished, in the
43d year of his age, according to Cicero, but in the 47th
according to Velius Paterculus, one of the most irrepro-
achable characters in Roman history; according to Blair’s
table, A.U. 712, B.C. 42.

To his generosity, humanity, uprightness, and well-
principled virtue, public and private, writers of all parties
have borne testimony; and those who have condemned the
act of assassinating Caesar, have ascribed it, on the part of
Brutus, to patriotic motives. Indeed, Antony himself did
him the justice to say, that “was the only one of the con-
pair who entered into it out of principle; that the rest,
from private malice, rose up against the man, he alone
against the tyrant.” No man in public life seems to have
set up virtue more sincerely as the object of his veneration
and pursuit than Brutus; and it does not, therefore, seem
probable, that, according to the report of some writers, his
final speech should be a confession of error in having followed
an empty name. “His memory,” says one of his biographers,
“was cherisned and honoured as long as a spark of Roman
spirit survived the loss of constitutional freedom; and the
names of Brutus and liberty are to this day inseparably
associated.” His body was treated with respect by Antony;
but the vindictive Octavius caused the head to be cut off,
in order to expose it at the feet of Caesar’s statue. But
his delination was defeated, as it was thrown over-board in a
storm. The remains were honourably burnt by order of
Antony, and the ashes interred in the same sarco.

Plutarch’s Brutus, apud Op. t. i. p. 984. Middleton’s Life of Cicero,

BRUTUS, in Entomology, a species of Papilio (Eg.
Actio.) The wings are white with a black border; on the
lower pair beneath, a fulvous band. This inhabits Africa;
where it is the large and rare insect. Cramer describes a variety
of it under the name of Meropa.

BRUTUS, in Geography, a military township of America,
in New York, through which runs the river Seneca, and
where it receives the waters of Oswego lake, passing from
the south-east through the town of Aurelius and Scipio. It
lies 11 miles N.E. from the north end of Cayuga lake,
and 19 S.E. from lake Ontario.

BRUTUS,
BRUTZ, a town of France, in the department of the Ille et Vilaine, and district of Redon, 2 leagues south of Rennes.

BRUX. See Bruxel.

BRUYE or BRUX, an island in the bay of Bengal, near the mouth of the river Awa, about 8 leagues long and 3 broad. Lat. 16° 15'. E. long. 97° 37'.

BRUYER, John De L, in Biography, a French writer of reputation, was born, in 1646, in the life of France, and, at a proper age, recommended by Bossuet to instruct the duke of Burgundy in history. The residue of his life was passed in court, where he maintained the character of a man of letters; philosophical and unambitious in his temper, as well as polite and polished in his manners, uniting the gaiety and social polish of the well-bred gentleman with the laborious habits of the scholar. In 1664 he was admitted into the French Academy, and, in 1667, a fit of apoplexy terminated his life. His work entitled "Characters of Theophrastus, translated from the Greek, with the Characters or Manners of this Age," was first published in 1657, and has been several times reprinted. In this work, of which Malzick predicted that "it would gain many readers and many enemies," the author has had the honour of participating with Malvise in the correction of more follies and indecencies than perhaps any other moralist, ancient or modern. The pencil with which he pictured modern characters and manners is strong but delicate; his style is nervous but abrupt, occasionally obscure, and affectedly sententious. The maxims of Plutarch are almost wholly transplanted into his works. Keys were made of his characters, for the court, the capital, and the provinces; and his book, by means of its success, produced many imitations. The best editions of the "Characters" are those of Amsterdam in 1741, and of Paris in 1752 and 1769. The authors "Dialogues of Quietism," were arranged for publication by M. Du Pin, and printed in 1699. Nov. Dict. Hill.

BRUYRES, in Geography, a town of France, in the department of Eure, and chief place of a canton, in the district of Seine, 11 miles E. of it. The town contains 1911 and the canton 13,435 inhabitants; the territory includes 210 square miles, and 32 communes. Nov. Dict. Hill.

BRUYENS SOUS LAON, a town of France in the department of the Aisne, and district of Laon, 1 league S.S.E. of Laon.

BRUYN, Cornelius L, in Biography, a traveller and painter, was born at the Hague, and having commenced his travels through Mulcovy, Persia, the Levant, and the East Indies, in 1670, completed them in 1708. His "Voyage to the Levant" was published at Amsterdam in 1714, folio, and his "Travels to Mulcovy, Persia, etc." in 1718, in 2 vols. fol.; an edition much enlarged for the beauty of its plate, but excelled in value by that of Rouen in 1725, in 2 vols. 4to. on account of the corrections and notes of the Abbé Banier. As a traveller, Bruyn is curious and instructive, but his style is inelegant and his facts sometimes erroneous. Nov. Dict. Hill.

BRUYNSWICK, in Geography, a plantation of America, in Ulster county, New York.

BRUYS, Peter De, in Biography. See PETROBRUSIANI.

BRUZEN DE LA MARTINIERE, Antony-Augustus, an industrious compiler, was born at Dieppe, in 1666, and educated at Paris, under the care of his uncle, the celebrated Richard Simon. In 1700 he was employed, by the duke of Mecklenburg, in researches into the history of that duchy, and afterwards attached to the duke of Parma, and to the king of the Two Sicilies, who appointed him his secretary with a handsome salary. Upon his retirement to the Hague, he completed his "New Geographical Dictionary," which was dedicated to the king of Spain, and recompensed by the title conferred upon him by that monarch, of his first geographer. After a life of study and labor, as well as of social intercourse and pleasure, fitted to his friendly disposition and polite manners, he died at the Hague in 1749. His reading was extensive, and he wrote with judgment, facility, and generally with elegance. His favourite themes were geography, history, and polite literature. The most valuable of his numerous works are "The Great Geographical, Historical, and Critical Dictionary," 10 vols. fol. Hague, 1726 to 1739, and Paris, 1756, 6 vols. fol.; "Polledorff's Introduction to the History of Europe, greatly augmented and corrected," of which the last edition is that of the Hague, in 11 vols. 12mo; "Geographical and Historical Tracts to facilitate the Knowledge of the Holy Scriptures, by several celebrated Authors, Huet, Le Grand, Calmet, Hardouin, &c" 2 vols. 12mo. 1730; and "Selections of M. Simon," with a life of the author and curious notes, Amst. 4 vols. 12mo. Nov. Dict. Hill.

BRVA, in Botany, (Browne Jam.) See Amer immunity Eburnus.

BRYAN, in Geography, a county of America, in Georgia, adjoining Chatham county on the west and southwest.

BRYANT, Jacob, in Biography, the son of a Customs officer at Plymouth, was, for the honour of Devonshire, born there; though he has been represented by some as a native of Kent, from the circumstance of his father's being transferred to that county whilst himself was a child.

Placed upon the foundation of Eton college he was early distinguished for classical attainments; and the high reputation with which he entered King's served as an incentive to his future exertions. Succeeding at the ordinary period to a fellowship in that college, he continued its ornament till nearly the end of the century, and the boast of both institutions to the close of his life. Having devoted himself early to habitual study, he persevered with but few interruptions; and these are to be considered as referring rather to a change of subject, than a breaking off from his ordinary pursuits; for, during his secretaryship to the duke of Marlborough and the Board of Ordinance, he availed himself of the opportunities which his employments afforded for rendering his knowledge in modern tactics subservient to that of the ancients. As he attended the father in the capacity of secretary during his military commands, so he accompanied him to the seat of the Muses; and, in the office of private instructor, superintended his studies while at Eton of the present duke of Marlborough, as well as those of his brother Lord Charles. Devoting himself to a life of literature, his diligence was unremitting in his favourite pursuit, and the effects of it were consecrated to the noble purposes of learning and religion.

The first work which he formally published was "Observations and Enquiries relating to various parts of ancient History, containing Diffusions on the Wind Euroclydon, and on the Island Melic; together with an Account of Egypt in its most Early State, and of the Shepherd Kings," 1767. Those who knew Mr. Bryant formed considerable expectations from his acknowledged reputation, when this volume was announced; nor were they disappointed in its appearance. The opinion entertained of his learning was confirmed by it, and the ingenuity displayed in it acquired him considerable commendation.
His next communication to the public, and the work on which his character as a scholar must ultimately rest, was his "New System, or Analysis of Ancient Mythology; wherein an Attempt is made to divest Tradition of Fable, and to reduce Truth to its original Purity." Of this publication the first and second volumes came forth together, in 1774, and the third followed two years after. It being his professed design to present a history of the Babylonians, Chaldæans, Egyptians, Canaanites, Hellenes, Ionians, Læges, Dorians, Pelasgi, and other ancient nations, his researches for this purpose were not only of necessity confine to, but in many instances uncertain; but to facilitate his paillage through the mighty labyrinth which led to his primary objects, he not only avoided himself of the scattered fragments of ancient history wherever he could find them, but also of a variety of etymological aids; for being perfused that the human race were the offspring of one flock, and conceiving thence that their language in the beginning was one, this favourite notion was emblemed by him in the investigation of radical terms, and applying these as collateral aids. Considering that his knowledge of the Oriental dialects was very confined, it is to be lamented that upon some occasions he has indulged too freely to fancy; yet thus much must be confessed, that his defects in this kind of learning form a strong plea in his favour; for if, without underdertaking these languages, he has succeeded in tracing out so many radicals as his table of them exhibits, and more especially if he has been right in explaining them, it will follow that his explanations must be founded on truth, and therefore are not chimerical. In opposition, however, to them, Mr. Bryant experienced some severe and petulant attacks: first, from a learned Dutchman, in a Latin review of his work; and shortly after from the late Mr. Richardson, who was privately allied by Sir William Jones; a circumstance which there is reason to think Mr. Bryant never knew.

To their strictures Mr. Bryant replied in an anonymous pamphlet, of which he printed a few copies for the perusal of his friends, but never professedly published. It is hoped, however, that, in the next edition of his Mythology this tract will be added, as it is among the best of his works.

Amongst other parts of the Mythology which were attacked with asperity, that which relates to the Apamean medal was severely affailed. Mr. Bryant defended himself in a separate publication (which also should be subjoined to the new edition); and though what he offered on the subject was lightly treated by some, who highly appreciated their knowledge of medals, yet the opinion of professor Eckel, the first medalist of his age, has decided on the controversy in favour of Mr. Bryant.

Whatever may be the merit, in the opinion of the learned, of Mr. Bryant's New System at large, no person can possibly dispute, that a very uncommon store of learning is perceptible through the whole; that it abounds with great originality of conception, much peripatetic elucidation, and the most happy explanations on topics of the highest importance: in a word, that it stands forward amongst the first works of its age.

About this time the Vindicæ Flavianæ, a tract on the much disputed testimony of Josephus to Chrifti, was printed, and a few copies sent to a bookseller in either university; but as the pamphlet appeared without the name of its author, and no attention was shewed it, Mr. Bryant recalled them, and satisfied himself with distributing the copies thus returned amongst a few particular friends. The new light, however, which Mr. Bryant threw upon the subject, and the acuteness with which the difficulties attending it were difcussed, soon caused the Vindicæ to be known, and at length to be published with his name.

Dr. Prieſley having, by his statement of the doctrine of philosophical necessity in a left exceptional point of view that in which it had been heretofore seen, attracted attention to the subject, Mr. Bryant was alarmed at the pernicious tendency, as he conceived, of the doctrine; and with the design of checking its advancement, addressed the Doctor on the subject. But whatever impression this address might have produced on other readers, it certainly left his antagonist unconvinced; which, however, was not the case in a former instance, for Mr. Prieſley liberally confessed that, in respect to the testimony of Josephus concerning our Saviour, Mr. Bryant had made him completely a convert.

The poems attributed to Rowley having been published by Mr. Tyrwhitt, Mr. Bryant's attention was next drawn to them. From the communications of his friend Dr. Glynn, and his own enquiries at Britol, Mr. Bryant having acquired such information as convinced him, that they had their foundation in reality, and were not entirely of Chatterton's fabrication, embodied in the context; but though he failed to produce conviction in several particulars, his book discovers considerable talent, as well as much knowledge of English antiquities and literature, and abounds with arguments which cannot be repelled.

The hypothesis of Mr. Bryant in reference to the original language was always kept in view by him, and as researches were extended on all sides to obtain elucidations, the language of the gipies engaged his attention; accordingly the collections which he made from it, were published in the Archaeologia, vol. vii.

His next production, but which still remains unpublished, was an illustration in Latin of gems in the possession of the duke of Marlborough, engraved for his Grace by Bartolozzi. Of this magnificent work Mr. Bryant's observations formed the text of the first volume, that of the second was written by Dr. Cole, prebendary of Westminster.

The friendship which subsisted between Mr. Bryant and the family of his patron, prompted him on all occasions to subserve their wishes, and to this disposition are the public indebted for his Treatise on the Authenticity of the Scriptures and the Truth of the Christian Religion, which was written to gratify the dowager lady Pembroke, and is an excellent book for popular instruction.

In two years after (for the treatise just mentioned appeared in 1752) the world were obliged by a large volume, entitled "Observations upon the Plagues inflicted upon the Egyptians; in which is shewn the Peculiarity of those Judgments, and their Correpondence with the Rites and Idolatries of that People; with a Prefatory Discourse concerning the Grecian Colonies from Egypt." This is certainly to be reckoned amongst Mr. Bryant's best performances, and as such will be judiciously read.

Professor Dalzel having communicated to the Royal Society of Edinburgh, and afterwards published in a separate volume, M. le Chevalier's "Description of the Plain of Troy," Mr. Bryant, who many years before had not only confidered, but written his sentiments on the Trojan war, first published his observations on M. le Chevalier's treatise, and afterwards a dissertation concerning the war itself, and the expedition of the Grecians as described by Homer; with the view of shewing that no such expedition was ever undertaken, and that no such city in Phrygia existed. [The elegant treatise of Mr. Wood on the genius and writings of Homer, were edited, for his deceafed friend, by Mr. Bryant.]
The clamour excited by these pamphlets almost exceeded belief. The author was attacked in all companies without mercy, and even by men from the prefs, who should have thought more soberly, for having indulged so excessive a scepticism, as could not, in its most direct effects, but be pernicious to the cause of divine revelation. Such cenfures, however, when duly weighed, could be disgraceful only to their authors, whose want of temper, or of judgment, rendered them unable to discriminate.

Amongst Mr. Bryant's principal opponents were Mr. Gilbert Wakefield, Mr. Morrit, and Dr. Vincent: but though the champions for the war strenuously affiled their antagonists, several of Mr. Bryant's objections remain as yet unanswered.

In the following year Mr. Bryant submitted to the public a work of a different kind and character, under the title of "The Sentiments of Philo Judeus concerning the Logos, or Word of God, together with large Extracts from his Writings, compared with the Scriptures in many other particular and essential Doctrines of the Christian Religion." But, learned and curious as this treatise unquestionably is, it appears to have interfiled the general reader less perhaps than any of his other productions. In addition to those already noticed may be added his "Observations on famous controverted Passages in Justin Martyr and Iosephus," and a pamphlet addressed to Mr. Malmoth, written with less temper than might have been wished. Mr. Bryant closed his labours with a quarto volume of Dilletations on the prophecy of Balaam; the flanding still of the sun in the time of Joshua; the jaw bone of the as with which Sampson flew the Philistines; and the history of Junah and the whale: subjects in themselves exceedingly curious, and treated with much ingenuity; but these tracts upon them having been written above thirty years before, Mr. Bryant in reviving so altered, as, through a defect of memory, to render the remarks in one part inconsistent with those in another, which materially diminished the value of the whole.

Other writings to a considerable extent still remain in the hands of his executor, who is said to have submitted them for publication to a competent judgment.

In forming a general estimate of Mr. Bryant's literary character, it will be found that, as a classical scholar, he had few equals; his acquaintance with history and the topics of general information was of very uncommon extent, but from the want of Oriental literature and the fiercest sciences he yielded too often to the impulles of a vigorous fancy. It will, notwithstanding, be found from repeated perusals of his writings, that he deservedly ranks amongst the foremost of his age; and from having consecrated his great talents and acquisitions to the service of mankind, will be ever entitled to the veneration of mankind.

In his person Mr. Bryant was lower and more delicately formed than men in general, and consequently less capable of strong exercise; but, in early life he had great agility, particularly in swimming, a circumstance which enabled him to save Dr. Barnard, afterward head master of Eton, when drowning. In his ordinary habits of life he was remarkable for his temperance, and though his time and studies were principally devoted to literature, and the pursuit of truth, yet his conversation with those he received and conversed with was uncommonly flirtel, as he never failed to mix entertaining anecdote with instruction. In his peron he was particularly neat, and in his deportment courteous. His liberality was often conspicuous, and the spirit of religion diffused itself through all his actions. As few comparatively live so long, infancies of such exemplary merit can but rarely be found. Elected from Eton to King's, in 1736, he proceeded bachelor of arts in 1741; in 1744, took the degree of master, and died, after a long residence, at Copenham, near Windor, on the 11th of November, 1804, of a mortification in his leg, occasioned by a hurt from the tilting of a chair in reaching down a book from its shelf. At his own desire, Mr. Bryant was interred in his parish church, beneath the seat he there occupied.

BRYANT'S Cove, in Geography, lies on the east coast of Newfoundland, half a league S.W. from Harbour Grace, and two and a half leagues to the south-west of Spanish bay, in which there is good fishing for boats.

Bryant's Lick, a south-east branch of Green river, the mouth of which is about 27 miles E. of Craig's fort, and 10 E. of Sulphur spring, in Mercer's county, Kentucky.

BRYANTHUS, in Botany (Gmel. Sib.) See Andromeda bryantii.

BRYE, John Theodore de, in Biography, excelled in the art of designing and engraving. He was a native of Liege, but resided chiefly at Franckfort, where he carried on a considerable commerce in prints. His table was formed on the works of Sebald Beham. He seldom used the point, but worked almost wholly with the graver. His style of engraving was neat and free, excellently adapted to small subjects, comprehending many figures; such as funeral processions, &c. His drawing was very correct: his heads spirited and expressive, and the other extremities of his figures well marked. His back-grounds, though flight, are admirably touched. He died March 27, 1598. His great works were the plates for the first four volumes of Boiffard's Roman Antiquities; the plates for illustrating the Manners and Customs of the Virginians, copied by Pi- cart in his Religious Ceremonies of all Nations; the plates to the Latin Narrative of the Cruelties of the Spaniards in America, published in 1598, and his "Description Indicibus Orientalis et Occidentalis," 5 vols. fol. 1598; and among other detached prints his "Procession for the Funeral of Sir Philip Sidney," engraved at London, 1578. Strutt.

Brynnaus, Nicephorus, was a native of Orelia in Macedonia, and married the princes Anna Commena, daughter of Alexius Comnenus, who raised him to the rank of Caesar, but declined announcing him as his successor in prejudice of his own son. After the death of Alexius, the empress Irene and her daughter Anna attempted to elevate Brynnaus to the empire, but he refused to concur in the plot. Having been feit, in 1137, to besiege Antioch, he fell sick, and returning to Constantinople died in that city. His history of the reigns of Isaac Comnenus and of the three succeeding emperors, was composed in four books, and published with a Latin translation, by the jefuit Pouffines at Paris in 1661, to which the annotations of Du Cange were annexed in 1676.

Brynnaus, Manuel, the laus writer on music in the Greek language that has come to our knowledge. He flourished under the elder Palaeologus, about the year 1320; and it is probable that he was a descendant of the house of Brienne, an ancient French family, that went into Greece during the Crusades, at the beginning of the thirteenth century. Fabric. Bib. Gr. Du Cange, Fam. Bryant.

The work is divided into three books, all which are confined to harmonics: the first is a kind of commentary on Euclid; and the second and third little more than explanations of the doctrines of Polymy.

Melobonius had promised a Latin translation of this work, but dying before it was finished, Dr. Wallis performed the talk, and it now constitutes a part of the third volume of his works, published at Oxford in 2 vols. fol. 1690.

That the Greek music had undergone many alterations since
since the ancient treatises which are come down to us were written, is certain from the change and increase of its vocabulary. Bryonian (lib. iii. sect. 3) has given as names of intervals, a list of barbarous terms not to be found in any preceding writer within our knowledge; and in the Greek glossary of Du Cange, and the Abate Martin's papers on the present use of Greece, a great number occurs that is not to be found either in writers of high antiquity, or in Bryonian: as lib. iii. sect. 4, the words τηρηται, χρησται, appear for ρουρες and ὑλόμοι; and τήται, δίκαιον, τηλέμα, τει-τηνα, are used to distinguish the modes or tones: a proof that he was a modern Greek. Padre Martin is of opinion

BRYONIA, in Botany, (Bryonia, Dioscorides; from ἄδος, germin, pululo, expressive of the vigorous and rapid growth of its annual stems from the perennial root.) Lin. gen. 1003. Reich. 1594. Schreb. 1486. Gartnert 531. Jullius 394. Ventenar. vol. iii. 511. Claph. monsia ignea. Pentandria. Smith. Nat. Ord. succulentes. Linn. & Jull. Gen. char. Male flowers. Cal. Perianth one leafed, campanulate, five-toothed; teeth oval-shaped. Cor. five, parted, campanulate, fastened to the calyx; divisions ovate. Stam. Filaments three, very short, two bearing each two anthers, and the third with only one. Female flowers. Cal. Perianth as in the males, superior, deciduous. Cor. as in the males. Pist. Germ. inferior. Style trifid, the length of the expanding corolla; stigma marginal, peltate. Peric. Berry subglobose, smooth. Seeds, not numerous, fixed to the coat, subhovate. Schreb. Not more than six, inclosed in their proper cells. Gart. Species. 1. B. alba. Linn. "with black berries, and the inward substance of the root of a pale box colour; leaves palmate, callous-febrons on both sides." This species, though mentioned by many of the old botanists, does not seem to be much known since the time of Linnaeus. La Marec observes that he knows nothing of it, and seems to speak with some degree of doubt with respect to its exit-

ence. In this, however, he is certainly wrong: it must have been known to Linnaeus. Boeuf says that it is a truly distinct species, but gives no description. It appears to be confined to the north of Europe, and not to be found in England or France, for though Plucknett speaks of it as not unfrequent at Cambridge, he was probably mistaken; it had not been observed by Ray, nor has it been found since in that neighbourhood by Professor Martyn, nor in any other part of Great Britain. 2. B. dioica. Jacq. Aud. t. 139. Hall. Helv. 574. Allom. Ped. 475. Pollux. pal. 915. Ray hift. 659. Syn. 261. Huds. Ang. 437. Smith Flor. Brit. 398. Eng. Bot. 439. "Berries red; root yellow with white within; leaves palmate, callous-febrons on both sides; flowers dioicos." Root large, fleshy, white. Stema annual, scendent, angular, rough, leafy, somewhat branched, very long. Leaves alternate, petioloed, palmate, five-lobed, angular, rough on both sides, with minute cal-

The leaves in autumn have the smell of mulf. Smith. The roots have been artificially made to assume a human shape, and known to the common people as roots of the celebrated mandrake. Atropa Mandragora, to which many fanciful virtues have been attributed. For this purpose the earth is removed round the root of a thriving young plant, so as not to disturb the lower fibres, and a mould, such as is used for platter figures, is made falt with wires to receive the growing woody part of the root; the earth is then replaced; and in the course of a summer a root of the required shape is produced. 3. B. palmata, Linn. "Leaves palmate, fovea, five-lobed, repand-ferrate." Root perennial. Berries yellowish, globular, rather large. Native of Ceylon. Introduced into England in 1778, by Meffrs. Gordon and Grefier. 4. B. laciniata, Linn. Gart. tab. 88, fig. 2, copied by La Marec. pl. 796, fig. 2. "Leaves palmate; divisions lanceolate, ferrated, petioles mucratae." Root perennial. Leaves cordate, palmate, rough above, rougher beneath on the rib and nerves. Petioles almoit prickly; not peduncules as it stands in the Botanica, as copied by Reichard, and translated without a comment by La Marec. Corolla yellow, hairy, or tomentous within, smooth without. Germ fovea. Fruit fellow, of the size of a cherry, marked with six milk-white lines. Berry fleshy, three-celled, the pulp in each cell easily separable from it, gelatinous-membraneous, two-celled, green. Seads six, one in each cell of the pulp. La Marec describes a plant cultivated in the Royal garden at Paris, which he supposes to be the Naboemca of the Hortus Malabaricus, and not specifically distinct from the laciniata of Linnaeus, though Linnaeus has cancelled the reference to it as a synonym in the Botanica, after having admitted it in the Species Plantarum. The plant in the French garden has deeply palmated fovea leaves, but the petioles, as well as the polli-

erion nerves, are armed with almost thorny prickles.

4. B. Africa. Linn. Herm. Parad. 107. tab. 108. Gartner, 2, tab. 88, copied by La Marec, pl. 796, fig. 3. "Leaves palmate, five-parted, fovea on both sides; divisions pinnafrid." Upper leaves five-parted, fovea on the edge; divisions pinnafrid, at the base, perforate. Berries solitary, roundish, bead, obtusely angular, yellow. Linn. Kind of the berry fleshy, rather thick, orange-coloured on the outside; pulp, membraneous-porous, easily separable from the rind, regularly divided into six, sometimes only four cells. Seeds one in each cell, ovate-globose, comprized at the sides, and
and especially towards the navel, to a sharp edge, with very minute, whitish bristles or scales lying close to their surface.

Grtt. La Marck describes a plant, cultivated at Paris, which he takes to be the same, in which the leaves are roughish beneath. 6. B. cedrica. Linn. "Leaves palmate, rough with callous points on their upper surface." Root long, not so large as B. dioica, running deep into the ground. Leaves divided like those of the common form, but less, flecked or spotted with white. Flowers axillary, pale, streaked, on long pedant pedicules. Berries small, semi-globular, divided at top into two parts, red, generally containing only two seeds. Miller, and La Marck. Native of Candia, whence the seeds were sent to C. Bonnini. Cultivated by Miller, before 1779. 7. B. bouvaria, Mill.; *fisnolata, La Marck. Dill. Edin. tab. 50. fig. 58. La Marck, Pl. 756. 1. "Leaves semi-palmate, five-parted, with obtuse segments, hairy." Root and stems like those of the common bryony. Leaves resembling those of the common fig, but smaller; narrower and smaller at the ends of the branches, hairy, and very rough, upper surface deep green, lower whitish. Native of Buenos Ayres. Cultivated in the Eltham garden, about 1726. Mill. 8. B. variegata, Miller. "Leaves palmate, with lanceolate segments, spotted on the upper, smooth on the under side; fruit ovate, scattered." 9. B. grandis. Linn. Mant. "Leaves cordate, angular, smoothish, glandular at the base underneath; tendrils simple." Stem shrubby, smooth, large, branching, scendent. Leaves roundish, five-angled, not lobed, smooth on both sides, scarcely denticulate, obtuse, alternate, petiolate. Flowers large, whitish, androgynous, lateral; pediciles one-flowered. Berry roundish, red, smooth, five-celled. Seeds few, oblong, obtuse, compressed. Native of India and Cochin-china. Introduced into England in 1783, by Mr. I. Grafton; into France, by M. Sonnerat. 10. B. cordifolia. Linn. "Leaves cordate, oblong, five-lobed, toothed, scabrous; petioles long, with two teeth at the base of the leaf." Stem angular, rough. Native of Ceylon. La Marck supposes it to be a variety of the preceding. 11. B. Madrarepotana, Berg. cap. 331. Costus Madrarepotana. Linn. "Leaves cordate-triangular, toothed, scabrous; berries globular, axillary, in pairs." La Marck. Stem flender, angular, thinly sprinkled with small callous protuberances. Leaves longer than the petiole, toothed at the edges, slightly villous beneath, green, and rather rough. Flowers small, axillary, with a villous calyx, growing two or three together on very short pedicules. Berries globular, many-seeded. A native of the East Indies. La Marck says, that it is certainly a bryony. 12. B. febrile. Linn. fol. 424. "Leaves cordate, angular, and lobed, callous-hispid; tendrils simple; berries globular; feelis mucrata." Martyn. Whole plant very scabrous. Stems five-cornered, hispid. Tendris simple. Leaves blunt, unequally toothed, a little curled at the edge; pediciles hispid. Peduncles many; axillary short. Calyx bell-shaped, five-toothed. Corolla small, very like those of melobrosis, yellow. It has altogether the nature of melobrosia, but the whole plant is hispid and rugged, and has the flammes of bryony. A native of the East Indies found by Dr. Ke nig, and introduced into England in 1781, by Sir Joseph Banks, bart. La Marck describes a plant under the same specific name, which he thinks nearly allied to the preceding, with a doubt whether it be the febrile of the younger Lin nes. It differs from Martyn's plant in having its berries perfectly smooth; a circumstance which the younger Lin nes has left undetermined. La Marck's description was made from a dried specimen. 13. B. febrile. Linn. fol. 423. "Leaves cordate, angular, toothed, callous-pointed above, villous underneath, feabrous on both sides. Tendris simple. Berries globular, smooth." Found at the cape by Thun berg and Maffon, and introduced into England in 1774. La Marck does not notice this species, unless it be his feb rile. 14. B. novis. La Marck. "Lower leaves cordate roundish, very entire; upper ones deeply three-lobed; lobes obtuse." Aided to B. Africana, but much smaller, and with leaves less deeply cut. Stem flender, a little villous, scarcely more than a foot and a half high. Leaves alternate-petiolate, green, smooth above, feabrous, with callous points beneath. Native of Africa. Described from a living plant without flowers in the Royal garden at Paris. 15. B. Abyssinica. La Marck. "Leaves large, cordate, toothed; upper ones lobed-angular; petioles and pedicules very villous." Stem five or eight feet high, villous, especially near the top. Leaves soft, almost smooth, deep green above, a little glaucous beneath; the lower ones cordate and toothed, the upper ones with four or five angular, unequal lobes. Flowers yellowish, axillary, in pairs; pedicules simple, short. Corolla five-parted, spreading, veined. A native of Africa. Described from a living plant in the Royal garden at Paris. 16. B. Americana. La Marck. "Leaves large, cordate, three-lobed; berries oval, with two or three seeds." Stem tender, white, a little bitter. Leaves long, angular, twining, jointed, with a leaf, a tendril, and a flower at each joint. Leaves petiolated, a little rough, with a few rather fimbrious teeth, and resembling those of the common fig. Flowers pedunculate, with five divisions, greenish without, white within. Berries oval, about the size of an olive, red. Seeds two or three, bedded in a spongy pulp. Plummer's MSS. A native of the Antilles. 17. B. japonica. Thunb. "Leaves cordate, undivided, and angular, toothed, unarmed-hispid." Lobes of the leaves angular, sharp, with very minute hairs on the upper surface, pale underneath, dotted with scales, an inch long. It creeps on walls. Native of Japan. 18. B. racemosa. Miller. Plum. pl. 83. 1. 97. "Leaves cordate, three-lobed, the upper ones ovate and somewhat ruged; flowers in racemes; berries nodding, oval." A native of Jamaica. 19. B. verrucosa. Ait. Hort. Kew. 3. 385. "Leaves cordate, angled; the upper surface and the veins underneath callous-feabrous; the calycticles remote; tendrils simple; berries globular." 20. B. latemor. Ait. Hort. Kew. 3. 384. "Leaves subtrinerv, hairy, drawn to a point at the base." This and the foregoing were observed by Maffon in the Canary islands, and introduced here in 1779. The latter is easily distinguished from its congeners by the leaves not being in the leafy cordinate at the base, but recurrent along the petioles. 21. B. amplexicaulis. La Marck. "Stem angular, smooth; leaves flat, cordate, subangular, embracing the stem; berries foliar, acuminate." Stems flender, scendant; leaves alternate, cordate, slightly angular, smooth on both sides, dotted above, glaucous below, on short pediciles; the upper sometimes divided into straight diverging lobes. Flowers small, axillary, foliar, peduncled. Stem sharp-pointed at the summit. Berry fleshy, acuminate, very smooth, nearly the size of a hazel nut. A native of the East Indies, communicated by M. Sonnerat, and described from a dried specimen. 22. B. biflora. Martyn. Lour. Col echina. 594. "Leaves hiatate, edged with little teeth, smooth; pediciles many-flowered." Stem herbaceous, flender, scendant, cierre. Flowers androgynous, white, axillary. Calyx none. Corolla tubular, with a five-pated, upright border. Filaments placed at the bottom of the corolla, with three alternate, warty glands. Berry ovate, acute, small, red, one-celled; containing a few ovate, arilled seeds. Native of China about Canton. 23. B. tribbula. Martyn. "Leaves three-lobed, five-neried; stipes round-
BRYONIODES (Dill. Elth.) See Siccos angulata. BRYONIODES (Pluk.) See Cissus acida.

BRYUM (from Oen. german, pullulo) first used as a generic name by Dillenius in his catalogue of plants in the neighbourhood of Giessen, printed at Frankfort on the Main in 1717, introduced by him into his edition of Ray's Synopsis 1724, and finally illustrated with full descriptions and figures of all the then known species in his admirable Historie of Mosses, published at Oxford 1741. It was given to a family of mosses distinguished by the following characters. Stems generally erect, and little if at all branched. Peduncles either terminal, or springing directly from the stem of root; and when apparently lateral proceeding from the termination of the last year's item, not surrounded at its base, but hypnous, with a peltate or solitary involucrem, but having instead of it an oblong knob or tubercle. Capsules when young covered with a smooth calyptra. It was taken up by Linnaeus in his Flora Lapponica and Genera Plantarum, both published in 1737, and continued in all his subsequent works, with no material change of the original generic character. Dillenius enumerates eighty-one species in his Historiae Plantarum, sixty-one of which appear as English plants in the third edition of Ray's Synopsis; but in the Species Plantarum the number is reduced to thirty-two, many of Dillenius's species being considered only as varieties, and those which appear to be distinct being removed by Linnaeus to Miam. The twelfth edition of the Syllae Plantarum has only thirty-one, the B. capillare of the Species Plantarum being also removed to Trinicum. The number has since been greatly increased, so that Dr. Withering in the third edition of his Botanical Arrangement reckons ninety-two British species.

Hedwig, in his new system of mosses which is generally received in Germany, and is beginning to make its way in England through the powerful influence of Dr. Smith and Mr. Dawson Turner, has contracted the genus distinguished by this name within much narrower limits, taking

...
of it his Gymnodontum, Anidrangium, Encalypta, Lecia, Grimia, Weilii, Trycholotomum, Didymodon, Cynodontium, Tortula, Barbula, Bartramia, and part of its Sphacium, Fistifera, and Dicranum; and continuing it to such species as have the following character. Periflora, or fringe surrounding the mouth of the capsule, double; outer toothed, teeth fifteen acute; inner ciliate; cilia disform, arising from a keeled membrane. Male flower, capitiform, dioecious. It has however since been again extended with various modifications by different authors. Schreber includes in it Hedwig's Mnium and Webera, with this character. Capsula, ovate-oblong. Periflora, double; outer with fifteen broad flat acute teeth; inner membranaceous, plaited and keeled, laminated, with alternate broad and capillary divisions. Male, capitate, or discoid, or gemmiferous. Dr. Smith's Bryum comprehends Webera, Pohlia, and Mnium; and Mr. Turner adds Mnium. Dr. Smith's generic character stands thus; capsula, ovate-oblong, not furrowed. Periflora, outer with fifteen teeth dilated at the base; inner membranaceous, variously toothed and laminated. Calyptra not furrowed. Pedicell terminal. He enumerates thirty-three British species.

1. B. nutans, flaky pendulous thread-moss. Schreber, Swartz, Roth, Ehrt.; (Cerium, With, Hull, Sibth.) Dill. t. 50. f. 61. Eng. Bot. 1240. "Stem generally simple; leaves lanceolate acute, keeled; capsule obvolute, pendulous, obtuse," Stems growing in thick tufts, erect, short, often simple, moss leafy at their summits. Leaves pale green, glossy, lanceolate, acute, keeled, one-nerved, tipped with a furrate point. Fruit-flasks terminal, solitary, erect, sometime two inches long, glossy, tawny purple, pale upward. Capsula, pendulous, obtuse, a little attenuated or elongate at the base, rufous-coloured, not glossy. Lid convex, with a short, blunt point. Outer fringe yellowish; inner variously laminated. Perennial. 2. B. aurum, gold thread-moss, (Mnium pyriforme, Linn.) Dillen. tab. 50. f. 60. Eng. Bot. 389. "Stem perfectly simple; leaves falcate, upper ones very long; capsule pendulous, pear-shaped, suddenly contracted about the middle." Stems in tufts, erect, simple, half an inch high, filiform. Leaves pale yellowish green, capillary, loofe, keeled, very entire; upper ones very long, spreading in form of a star. Flowers terminal. Fruit-flasks solitary, erect, an inch long, capillary, of a gold colour, glossy, somewhat waved. Capsula gold coloured, highly glossy, pendulous, pear-shaped, rather blunt, attenuated from the base to the middle; lid rather conic, short, somewhat pointed; calyptra awl-shaped, white. Fringe yellow without; white within; teeth in a double series. Annual. 3. B. elongatum, Dicks. Fase. 2. 8. (Pohlia Hcd. Mnium Pohlia Hoff.) "Stem generally simple; leaves linear-lanceolate, thickened at the edge. Capsula rather nodding, cylindrical, elongate at the base." Stem erect, short, simple, but at length a little branched. Leaves deep green, spreading, lanceolate or linear-lanceolate, acute, one-nerved, very entire, curled when dry. Fruit-flasks an inch and a half long, solitary, nearly erect, purple, yellow near the top. Capsula a little nodding but not pendulous, cylindrical, curved, brown, a little contracted at its orifice, lengthened at its base into an obconical apophysis of nearly its own length; lid conical, acute, short; fringe outer very short, brown; inner white, toothed in a singleseries. Perennial. Obs. Dillenius confounded this species with nutans. 4. B. trichodes, long, capillary, thread-moss, Linn. (Mnium uliginosum, With. Meeria uliginosa, Hcd.) Dill. Tab. 49. f. 58. "Stem generally simple; leaves linear, obtuse; capsule obvolute, incurved, somewhat nodding; fruit-flask very long." Stems in tufts, scarcely an inch high, sometimess much shorter, erect, black with a ferruginous down at the base. Leaves erect but spreading, of a full yellow green, glossy, obtuse, very entire, keeled. Fruit-flasks terminal, solitary, very long, erect, capillary, red, but brown at the base, and yellowish at the top. Capsula inclining, obvolute on a short apophysis. Lid conical, obtuse, very short; fringe outer short, inner reticulated twice as long as the outer. Calyptra awl-shaped, flat, fringed. Perennial. 5. B. delabrum, pale-leaved thread-moss (Media Swartz, Hcd.) Dicks. Tab. f. 5. 3. "Stem very short, simple; leaves lanceolate, reticulated, a little ferrated at the top; capsule obvolute, nodding." Stems in tufts. Leaves pellucid, acute, one-nerved. Fruit-flasks solitary, terminal, erect, an inch and a half long, red. Capsula curved, opake, with a very contracted apophysis. Lid convex, with a short point, red; fringe outer short, ferruginous; inner reticulated, twice as long as the outer. 6. B. cylindricum, Dicks. Tab. 11. f. 4. "Stem simple; leaves lanceolate-linear, ferrated towards the top; capsule rather erect cylindrical." Stem scarcely half an inch high, erect. Leaves of a pleasant green colour, erect but spreading, acute, keeled, one-nerved. Fruit-flasks erect, terminal, an inch long, red. Capsula pale brown, small, flender, with an obtuse apophysis of its own magnitude, fringe pale. 7. B. carnellum, Linn. (Boletia carnellum Hoff.) Dill. Tab. 50. f. 69. "Stem generally simple; leaves lanceolate, acute, very entire, reticulated, placed rather remote from each other; capsule pendulous, top-shaped." Stems not half an inch high, in tufts, erect, red. Leaves alternate, pale green, pellucid, reticulated, very entire, one-nerved. Fruit-flasks terminal, solitary, half an inch long, a little zigzag, of a pale rote colour. Capsula pendulous, flesh-coloured, opake; lid conic, short, obtuse; fringe outer, rufy brown; inner, yellowish, toothed in a double series. 8. B. alpinum, Linn. Mant. Dill. Tab. 50. f. 64. "Stem branched, erect; leaves ovate-lanceolate, acute, imbricated; capsule oblong, pendulous." Stems in tufts, one or two inches high; branches erect, fluff, round, acute. Leaves imbricated densly on all sides, beautifully variegated with green and purple, glossy, very entire, pellucid, often with a very red nerve, when dry prehced close to the flem. Fruit-flasks lateral, solitary, an inch long, red, straight, rising higher than the stem. Capsulae obvolute-cylindrical, red when ripe; lid hemispherical, umbonate; fringe white or rote coloured. 9. B. capitatum, Linn. (Mnium capitatum With. Roth. Abb.) Dill. Tab. 50. f. 66. except the variety F. G. lefser flattened thread-moss. "Stem branched at the base, matted, leaves ovate-lanceolate, flat, ending in a hair; capsule obvolute, pendulous." Stems forming a dense tuft, branched from the base; branches triform, simple, spreading, leafy, obtuse. Leaves of a pleasant green, very entire, one-nerved, the upper one larger, spreading in form of a star. Fruit-flasks from the base of the branches, about an inch and a half long, capillary, erect, purple at the base, green at the top. Lid convex, umbonate, fringe yellow, teeth acuminate. 10. B. biebror, Dicks. Fase. 4. 16. Dill. Tab. 50. f. 65. F. G. "Stem very short, branched at the base; leaves oval-lanceolate, acuminate; capsule ovate, obtuse, pendulous." Stems scattered, with long fuscous roots. Leaves yellowish green, small, spreading, flat, very entire, a little pointed but not ending in a hair. Fruit-flasks from the base of the branches, half an inch long, erect, very red, glossy. Capsula rather large, thick, red at the base, fulvus at the top, often entirely blood red; lid hemispherical, umbonate, glossy, fulvous or scarlet; fringe nearly reflexing that of B. carnellum. 11. B. argentum, Linn. (Mnium argent. Hoff.) silvery thread-moss. "Stem branched at the base,
BRYUM.

base, matted; leaves ovate, concave, ending in a hair, imbricate; capulfle oblong, pendulous. Stems in convex tufts, half an inch high, branched from the base; branches thread-shaped, erect. Leaves with a silvery gloss, closely imbricated, very entire, one-nerved, ending in a short hair. Fruit-falks from the base of the branches, scarcely an inch long, capillary, glossy, purple at the base, yellow at the top. Calyptra short, reddish. Lid convex, very short, fulvous, fringe, yellow. 12. B. Zies., Dicks. F. 2. Tab. 10. Eng. Bot. 1821. "Stem erect, branches: leaves ovate, concave, imbricated, point-t; capulfle club-shaped, drooping." Perennial. Stems in tufts; branches round, obtuse. Leaves soon white or flesh-coloured, glossy, very entire, one-nerved. Fruit-falks from the base of the branches, an inch or more long, a little filament, red. Calyptra brown, lid convex, umbonate, glossy, pale brown. 14. B. capillaris, Linn. Sp. Pl. (Mnium Linn. Fl. Suec. With. &c.) "Stem branched at the base; leaves ovate-lanceolate, pellucid, keeled, somewhat serrated; capulfle obovate, pendulous." Perennial. Resembling B. cephalitum but larger. Branches about an inch long, erect, thickened at the base, flatulate. Leaves of a fine green, obtuse, very entire, one-nerved. Fruit-falks an inch and a half long, firm, red. Calyptra obtuse, between cylindrical and club-shaped, large; lid ferruginous, glossy, hemispherical, with a short, straight point, outer fringe fulvous with acuminate teeth. 15. B. annuum, summer thread-mosses (Mnium annuum Linn.) Dill. Tab. 50. f. 68. "Stem branched at the base; leaves ovate-lanceolate, pellucid, keeled, somewhat serrated; capulfle obovate, pendulous." Perennial. Stems red, erect, leathery; male simple, often elongate, gemmiparous; feminine branched. Leaves fine green, under a lens reticulate, keeled, one-nerved, acute. Fruit-falks terminal, solitary, an inch and half long, red. Calyptra nearly pear-shaped; lid conic, short, acute, flesh-coloured; fringe pale. 16. B. convolutum, Dicks. F. 4. Tab. 11. Fig. 11. "Stem divided at the base; leaves lanceolate, keeled, serrated near the tip; capulfle ovate, pendulous." Perennial. Stems in dense tufts, half an inch high, sometimes simple, naked below, red. Leaves yellowish green, glossy, acute, somewhat revolute, serrated from the middle; the lower ones shorter and nearly heart-shaped. Fruit-falks terminal, not an inch long, a little flattened, ferruginous. Calyptra short, dilated at the margin, almost to the tip; lid convex, umbonate. 17. B. attenuatum, tender, proliferous thread-moss. Dicks. F. 4. Tab. 10. f. 8. "Stem simple, proliferous; leaves flat, ovate, very entire, reticulate; capulfle club-shaped, cylindrical, erect." Perennial. Stems ascending half an inch long, filiform, often throwing out new stems which take root. Leaves crowded, acute, one nerved, pellucid. Fruit-falks terminal, erect, half an inch long, yellowish. Calyptra erect, flat, pale brown, contracted at the orifice; lid convex, without a point. 18. B. Lortum, swan neck thread-moss (Mnium hornum Linn.) Dill. Tab. 51. f. 71. Curtis Tab. 71. "Stem simple; leaves lanceolate, denticulate-ferrated; fruit-falk curved; capulfle ovate, drooping." Perennial. Larger than the preceding species. Stems in tufts, simple, leathery, red, ferruginous and tomentose at the base. Leaves fine green, pellucid, membranous, spreading acute, with a strong red nerve, waved when dry. Mostelline flower large, terminal, lorate, surrounded with large oblong leaves; feminine on a different plant. Fruit-falks terminal, solitary, very long, flattened, and red at the base, curved, and yellowish at the top, thickened under the calyptra. Calyptra large, drooping, ferruginous, red at the orifice; lid hemispherical, with a short point; outer fringe of a citron colour, with acute teeth, inner white. 19. B. erudum, (Mnium erudum Linn.) Dill. Tab. 51. f. 70. "Stem simple; leaves lanceolate, acute, very entire; upper ones narrow, denticulate; capulfle oblong, drooping." Perennial. Transparent-green thread-mosses. Stems in tufts, simple, erect, scarcely an inch high, naked at the base, dark purple. Leaves crowded at the top of the stem, glossy, of a fine green, pellucid, spreading, flat, one-nerved; lower ones shorter, upper narrower, and generally ferrated near the tip. Fruit-falks terminal, erect, an inch long, red. Calyptra ferruginous, scarcely red at the orifice; lid hemispherical, with a slight tip, yellowish; fringe citron-colour; calyptra recurved, deciduous. 20. B. marginatum. Dicks. F. 2. Tab. V. fig. 1. "Stem simple; leaves lanceolate, acute, denticulate, thickened at the margin; capulfle ovate; lid conic." Thick-edged thread-mosses. Perennial. Stems an inch high, erect, red. Leaves with a red nerve and margin. Fruit-falks terminal, erect, an inch long, flesh-coloured. Calyptra pendulous, red; lid, conic awl-shaped; calyptra awl-shaped, reddish, recurved. 21. B. interruptum. Dicks. F. 4. Tab. ii. f. 6. "Stem branched, intermediately leathery; leaves lanceolate, acute, completely ferrated; capulfle pear-shaped, rather erect." Interrupted thread-mosses. Perennial. Stems in tufts, an inch high, leafy, pendulous, in a determinate direction, red. Leaves falcate, yellowish green, glossy, reticulate, one-nerved; lower ones remote, small, red; fruit-falks terminal, erect, red, narrowly an inch long; capulfle brown, dilated at the mouth; lid hemispherical, obtusely umbonate. 22. B. nigricans. Dicks. F. 4. Tab. ii. f. 10. "Stem branched at the base; leaves lanceolate, entire, ferrated towards the tip; capulfle top-shaped, pendulous." Dark-green thread-mosses. Perennial. "Stems in tufts. Leaves dark-green, imbricated, acute, keeled, dilated at the base; fruit-falks terminal, ferruginous, curved at the top. Calyptra with a spreading orifice; lid convex, obtusely umbonate; fringe yellow. 23. Bryum tenuissimum. Dickson F. 4. Tab. ii. f. 6. "Stems branched; leaves brittle-shaped, very entire, curled when dry; capulfle ovate, inclining an apophysis small." Inclining curved thread-mosses. Perennial. Stem erect. Leaves loosely imbricated, keeled, dilated at the base. Fruit-falks terminal, erect, half an inch long. 24. B. cotyledon. Dicks. F. 2. Tab. v. f. 2. "Stem ascending, a little branched; leaves lanceolate, very entire, decurrent; fruit-falk keel-, jointed; capulfle club-shaped, pendulous." Elbow shaped thread-mosses. Perennial. Stems two or three inches high, leafy, clothed with a rusty down. Leaves spreading, fine green, pellucid, acute, thickened at the edge with a strong red nerve. Fruit-falk terminal, solitary, thicker than four inches long, yellowish brown, glossy. Capulfle attenuated at the base. Off. The largest bryum hitherto discovered. 25. B. ventricosum, (Bryum triquetrum. Huds. Hoff. Mnium Pseudo-triquetrum Hed. Hoff. With.) Dicks. F. i. P. 4. Dill. Tab. ii. f. 73. "Stem branched in a determinate direction; branches ascending; leaves alternate, lanceolate, ferrated at the tip; capulfle ventricose, pendulous."

Swelling
BRYUM

Swelling bog-thread-mosses. Perennial. Stems in tufts, with long roots, clothed with a rusty down; branches numerous, ascending, red, loosely leaved. Leaves pale green, alternate, erect, spreading, acute, one-nerved, twisted when dry, Flruit-flasks terminal, or from the tip of the branch of the preceding year, an inch and a half or two inches long, erect, purple at the base, yellowish at the top. Capsule ovate, short, a little contracted under the orifice; lid convex, with a short point; fringe yellow. 26. B. bimatum. Schreb. Roth. Swartz (B. triumatum & Hed. Mniium Bimatum Hoff.) Dill. Tab. lii. f. 73. "Stems branched; leaves ovate, awned, very entire, capsule pear-shaped, pendulous." Pear-shaped bog-thread-mosses. Perennial. Leaves two or three inches high, irregularly branched, of a dark rusty colour. Leaves elongate, yellowish green. Fruit-flasks from the end of the two or three year-old branches, two or three inches long, dark purple, glossy, sometimes knee-jointed towards the base. Capsule narrowed at the base, contracted under the orifice, twice as large as in the preceding; fringe yellow. 27. B. turbinatum. Swartz. Roth. (B. triumatum & Hed. Mniium turbinatum Hed. Hoff.) Dill. Tab. lii. f. 74. "Stems branched, leaves ovate, awned, very entire, capsule pear-shaped, pendulous." Pear-shaped bog-thread-mosses. Perennial. Leaves scarcely an inch high, in tufts; leaves fine green, spreading, alternate, approximate, one-nerved. Fruit-flasks an inch long, purplish brown, a little flaxeno. Capsule attenuated at the base; lid convexus, without a point; fringe rufif coloured. 28. B. filiforme. Roth. (B. ferpyllum & Hed. Mniium proliferum, Var. 2. With. Mniium filiforme, Hed. Hoff.) Dill. Tab. lii. f. 78. "Stems simple; barren ones, proclinate, a little branched; leaves ovate, serrated; capsule oblong, drooping." Starry-leaved thread-mosses. Perennial. Leaves determinately branched, one or two inches high. Leaves fine green, with a strong red nerve, scarcely reaching the tip. Fruit-flask terminal, about two inches long, a little curved, thickened at the tip; lid hemispherical. 29. B. cupulatum. Swartz. Roth. Hull. Sib. (Mniium ferpyllum & Linn. M. cupulatum Hedw. Hoff. With. B. ferpyllum & Hed. Hoff.) Dill. Tab. liii. f. 79. "Stems simple; barren one, proclinate, a little branched; leaves ovate, serrated; capsule ovate; lid hemispherical." Pointed-leaved thyme-thread-mosses. Perennial. Leaves of two kinds; the barren ones procumbent, throwing out roots, three inches or more long; fertile ones erect, simple, an inch long. Leaves fine green, pellucid, under a lens minutely reticulated, alternate, broad-ovate, somewhat waved, acutely serrated, pointed, with a strong pale nerve. Fruit-flask terminal, an inch long, flexuoso, roto-coloured. Capsule pendulous, short, ventricose, retuse, yellow, with a scarlet orifice; lid with a small point; fringe iron-coloured. 32. B. punctatum. Roth. Hull. Sibth. (Mniium ferpyllum, Linn. M. punctatum, Hedw. With. B. ferpyllum & Hed. Hoff. Swartz.) Dill. Tab. liii. f. 81. Eng. Bot. 1183. "Stems nearly simple; leaves ovate, very entire, dented, reticulated; capsule elliptical; lid awl-shaped." Dotted-leaved thyme-thread-mosses. Perennial. Habit of the preceding, but distinguished at once by its dotted leaves. Stems an inch and half high, leafy, red, often flexuoso. Leaves broadly ovate, very obtuse, a little pointed, thickened at the edge, red, repand, with a strong red nerve; the upper ones flaccito. Fruit-flask terminal, more than an inch long, purplish, bowed at the top; capsule pendulous, green, with a purple orifice, finally brown; lid yellow, convex at the base, with a rather obtuse recurved point. 31. B. refractum.

The sfylem of Hedwig does not seem likely at present to be recognised in France. La Marche, in the Dictionnaire Me-thodique, does little more than enumerate and describe the species of Linnæus, as theystand in the last edition of the Syllena Naturelle. Bœf, in the Nouveau Dictionnaire d'Histoire Naturelle, published so lately as 1805, says, that the byrum of Linnæus is a very natural genus; but that the German botanists, who never think that they have genera enough, have exercised their skill upon it, and have formed out of it seventeen genera, most of them founded on characters which are scarcely discernible with the best lens. It must be acknowledged that there is some reason for the complaint; and we feel a pride in reflecting that our two great English cryptogamists have fleeced a middle course, and have produced a real improvement in the science; avoiding at the same time the difficulties which are jutly objected to by the French naturalists.

As Hedwig's new genus bairamia, which was formed entirely at the expense of Linnæus's byrum, has been omitted in its proper place, owing to the German sfylem of mosses not having publicly received the powerful patronage of Dr. Smith and Mr. Turner, when that part of our dictionary was written, it cannot now be more properly introduced than as an appendix to the present article. The other genera will be found under their respective letters of the alphabet.

(Bryan
BRZESNO, a town of Bohemia, in the circle of Boleșlaw, 5 miles E. of Jung Buntzlaw.

BRZESANY, BREST, or BRISETSK, a well built town, with a castle, of Poland, in the patriciate of Red Ruffia, 24 miles N.N.E. of Halicz. N. lat. 54° 12', E. long. 25° 20'.

BRZEZIN, a town of Poland, in the patriciate of Dielk; 44 miles N.W. of Bielt.

BRZEZYNY, a small town of Poland, in the patriciate of Lencziez; 46 miles S.E. of Lencziez.

BRZISTEW, a town of Bohemia, in the circle of Boleșlaw; 11 miles S.E. of Jung Buntzlaw.

BRZOSTECK, a town of Poland, in the patriciate of Sandomirz; 56 miles S.S.W. of Sandomirz.

ESURA, a river of Poland, which runs into the Vistula, 12 miles E. of Plocko.

EU, a town of France, in the department of the Eure and Loire, and district of Dreux, 2 leagues N.E. of it.

BUA, or the Life of Partrigges, a small island in the northern part of the Adriatic, near the coast of Dalmatia, joined to the town of Trau by a bridge, 20 miles W.N.W. of Spalatro.

BUADH-VAILL, q. d. mouth-piece of victory, called also, in the old Irish tales and romances, Besenwezen and Bearnvaill, is supposed by Mr. Ousley to have been a species of trumpet. It is made of a light fine-grained wood, probably willow, and is 6 feet 4 inches long; the wider end measures 3 inches diameter, from whence it gradually tapers to a point at the other end, where a mouth-piece is supposed to have been fixed. This instrument, which is particularly described and illustrated by figures in the fourth volume of the Irish Transactions, was found in 1791, in the county of Mayo, lying horizontally in the body of a turf bog, at the depth of about 9 feet from the surface. The precise age of this instrument, the wood of which was perfectly found, is not ascertained. Mr. Ousley supposes it to have been at least previous to the settlement of the English in Ireland, as it is not mentioned by Cambrensis, or any subsequent author. Lord Dillon, on whose estate it was found, concludes, from the great accumulation of bog over it, that it must have been in the situation in which it was discovered for many ages, and this is further confirmed by the rudeness of its contrivance and workmanship, which indicates its remote antiquity.

BUAILT. See Builit.

BUAMACHUCO, a town of South America, in the country of Peru, and jurisdiction of Caxamiquilla, chiefly inhabited by Indians.

BUANES,
BUANES, a town of France, in the department of Landes; 5 miles W. of Aire.

BUARCOS, or BUARGAS, a town of Portugal on the sea coast, in the province of Beira; 7 leagues S.W. of Coimbra.

BUARID, a small island in the Red sea, near the coast of Arabia, 4 miles W. of Lohia.

BUBALE, in Zoology. See BUBALUS.

BUBALINUS SERENINS, a name alligned by some authors to the Ancestrum of the Cynodon, a very terrible sort of ferpent, according to report, common in that part of the world. It is said mischievous among cattle; a circumstance implied by the name it bears in India. The particular kind of ferpent bearing this name is not exactly known to us.

BUBALUS, the Buffalo. Gmelin describes this animal, Bux Bubalus, after Linnæus, as having the horns repugnate, or lying backwards, turned inwards, and flat on the front, or anterior part.

The Buffalo appears to be so closely allied to our common ox, that without an attentive examination it might be easily mistaken for a variety of that animal. In point of size it is rather superior to the ox, and upon an accurate inspection it is observed to differ in the shape and magnitude of the head, the latter being larger than in the ox; the forehead is more elevated, the muzzle of a longer form, much larger, square, and less depressed. But it is chiefly by the structure of the horns that the Buffalo is distinguished, those being of a shape and curvature altogether different from those of the ox; they are of a gigantic size in proportion to the bulk of the animal, and of a comprehesive or depressed form, with a sharp exterior edge; for a considerable length from their base these horns are straight, and then bend slightly upwards; the prevailing colour of them is dunry, or nearly black. The Buffalo has no dewlap; his tail is small, and delitute of vertebrae near the extremity, and his ears long and pointed. The teats of the buffalo, which are four in number, Definney conceives to be sufficiently indicative of this species, without advertising to any other character; for these, he remarks, are not disposed, as in other animals, in two longitudinal parallel lines, but on the contrary range in a single row in a transverse direction.

This animal has an appearance of uncommon strength. The bulk of his body, and prodigious muscular limbs, denote his force at the first view. His aspect is ferocious and malignant, at the same time that his physiognomy is strongly marked with features of stupidity; his head is of a ponderous size, his forehead convex, his eyes diminutive, and his muzzle flat, and what serves to render his visage still more fave are the tufts of frizzled hair which hang down from his cheeks and the lower part of his muzzle.

Most commonly the buffalo is entirely of a blackish colour with the exception of the hair at the top of the forehead, and the tuft at the extremity of the tail, which are of a yellownish white colour. The skin itself is also of a black colour, and from this general call it is but very seldom observed to vary; though we meet with descriptions in the works of travellers of white, grey, and reddish, or bay buffaloes. In Europe they are, however, sometimes whitish on the inside of the limbs, and Soumin records an example of one which he saw in Egypt, which had all its legs, belly, and sides, perfectly white. It varies, however, greatly as to the length and thicknecfs of its hair, and is sometimes seen nearly naked.

This animal is originally a native of the hotter parts of India and Africa, from whence it is said to have been introduced into Italy in the seventh century; and is now completely naturalized to the climate of the South of Europe. Mr. Pennant supposes the Buse syphus of Aristotle to have meant buffaloes. Gmelin is of the same opinion, referring for his Bubalus to Bux Bubalus in Africa, Bubalus, Aul. Hist. Afr. &c.; and he considers also the Bos Indicus of Pliny as the same animal. This conjecture has the advantage of much respectable authority, but there are naturalists of no mean celebrity who are disposed to discountenance it. Buffon endeavours to prove that the animal we are acquainted with at this day under the name of buffalo, was altogether unknown to the ancient Greeks or Romans; and further, that the buffalo was not transported from its native countries, the hottest parts of Africa and the Indies, to be naturalized in Italy, before the seventh century. In support of the former of these assertions, he alleges the silence of all authors prior to that age. For the second, he observes that the wild buffaloes of the hotter parts of Asia and Africa are precisely of the same kind as our buffalo. He compares the description of this animal with the remarks of travellers and navigators who have spoken of the buffaloes of Perlia and the Mogul empire, Bengal, Egypt, Guinea, and the Cape of Good Hope; and from this comparison infers that in all those countries the buffalo is of the same individual species as our European buffalo, subject only to some inconsiderable variation.

The buffalo grows in some countries to an extremely large size. Mr. Pennant quotes a pair of horns in the British Museum in proof of this, which are six feet and a half long, and the hollow of which will hold five quarts. Jerome Lobo, in his account of Abyssinia, affirms that some of the horns of the buffaloes of that country will hold ten quarts, and Dillon saw in India which were ten feet long; they are sometimes wrinkled, but generally smooth. The difference between the points of the two horns of the buffalo is commonly about five feet. Wild buffaloes occur in many parts of Africa and India. In Malabar, and the islands of Borneo and Ceylon, they are abundant, and are considered as exceedingly fierce and dangerous animals. The buffaloes of Abyssinia grow to twice the size of our largest oxen, and are called elephant-bulls, not only on account of their valour, but from their naked black skin resembling that of an elephant.

In a state of wildness the buffaloes live in the forests, and go about in great troops. The hunting of these animals is a favourite, but very dangerous pursuit, among the Indians, and requires the greatest share of dexterity. The hunters never venture in any numbers to oppose these ferocious animals face to face, but conceal themselves in the thicketts, or among the branches of the trees, from whence they flitke their javelins upon the buffaloes as they pass below them. These people are very fond of the flesh, which is affirmed by some to be hard and indifferently flavoured. They drive a considerable trade in the skins and horns of the buffalo, which for many purposes is far more useful than those of the ox. In the Mogul dominions it is no uncommon circumstance to entice the wild buffalo, the lion, or the tiger, in nets, when the people amuse themselves before they put them to death by forcing them to combat each other, and it is said that influences have occurred in which the buffalo has proved victorious over these powerful antagonists, by attacking one when he had overcome the other. Thunberg, in his travels through Japan, speaks of having seen, in the environs of Misco, buffaloes with a lunch upon the back; but from this peculiarity it has been thought most likely that it was the Zebu which that traveller observed, and not a variety of the buffalo.

The domestic buffalo is much cultivated in Egypt, where according to
according to Somnini it yields plenty of excellent milk, from
which butter is made as well as several kinds of cheese.

The buffalo (says that writer) is an acquisition of the
modern Egyptians, with which their ancestors were unac-
quainted. It was brought over from Persia into their
country, where the species is at present universally spread,
and is very much propagated. It is even more numerous
than that of the common ox, and is there equally domestic.

Though but recently domesticated, as is easily discernible
by the uniformly constant colour of the hair, and still more
by a remnant of ferocity and intractability of disposition,
and a wild and lowering aspect, the characters of all halt-
tamed animals. The buffaloes of Egypt, however, are not
near so wild nor so much to be feared as those of other
countries. They take partake of the very remarkable gen-

efies of other domestic animals, and only retain a few
sudden and occasional caprices. The sight of any thing
red, which is said to make them fly into fits of ungovern-
able fury elsewhere, makes no impression on those of Egypt.

The inhabitants of the country, besides their red turban,
wear also in general a rather short of the same colour, which
envelops the neck and chape, and I never observed that the
sight of either of these affected the buffaloes. They are so
fond of the water, that I have seen them continue in it
the whole day. It often happens that the water which is
fetched from the Nile near its banks has contracted their
musky smell.”

These animals multiply more readily than the common
ox: they are also more robust, better capable of bearing
fatigue, and, generally speaking, less liable to distempers.
They are therefore employed to advantage in different kinds
of labour. Buffaloes are made to draw heavy loads, and
are commonly directed or restrained by means of a ring passed
through the nose. Two buffaloes yoked, or rather chained,
to a cart, are able to draw as much as four strong horses.

As they carry their necks and heads low, the whole weight
of their body is employed in drawing; and their maws much
surpasses that of a labouring horse. In its habits the buf-
falo is much less cleanly than the ox, delighting to wallow
in the mud; and, next to the hog, may be considered as
the dirtiest of domesticated quadrupeds. His voice is
deeper, more uncouth and hideous than that of the bull.
The milk of the female buffalo is said by some authors to be
not so good as that of the cow, but it is more plentiful, and
is used for the purposes of the dairy in the warmer regions.
In the sixth supplemental volume of Buffon, it is affirmed
that the milk is far superior to cow’s milk, not only in taste
but colour, and that it makes the most excellent butter, cheese,
&c. The horns and horns are of more value than all the rest
of the animal; the former being of extreme strength and dur-
ability, and consequently well adapted for various purposes
in which strong leather is required; the latter are of a fine
grain, strong, and bear a good polish, and are therefore in
much esteem with cutlers and other artificers. Italy is the
country where buffaloes are most common in a domesticated
state, being used there, as in India, both for the dairy and
the draught. The parts in which they are most successfully
 cultivated are the district of the Pontine marshes, and those
of Sienna. The Spaniards are attentive to this race of
cattle, and indeed the cultivation of this useful animal seems
to be pretty general in all countries on the borders of the
Mediterranean sea both in Europe and Africa.

For so robust a creature, the buffalo is of a delicate con-
stitution, and suffers equally by an excess of cold or heat.
In the summer it retires to shady places, or into the water
in which it takes the greatest delight; and in winter retreats
to the warmer coverts, or the recesses and shelter of the
forests. This ingrained quality of the animal seems to
imply that the buffaloes originated rather in temperate cli-
mates than in those that are either very hot or cold.

Besides the males that are common to the ox and other
cattle, the buffalo is subject to one of a particular sort, with
which it is attacked only in the early part of its life. This is
called by the French tubirn, an expression that implies it
to be most common in the male. The symptoms of this
disease are easily detected by a considerable swelling
that takes place in the throat and under-parts of the muzzle, and
sometimes by the whole body becoming inflamed. The
poor animal thus afflicted refuses all kinds of nourishment;
his eyes trickle; his tongue appears covered with a thick
white scum; and when he attempts to walk, he moves with
difficulty at a slow pace, with a lame or limping motion.
They breed in the fourth year, producing young for two
years together, and remaining fertile the third. The buffalo
has seldom more than one young at a birth, or two at the
utmost; and they commonly cease breeding after their
twelfth year. Their term of life is pretty much the same
as that of the common ox.

The small naked Indian buffalo of Pennant, and its ana-
logous variety, the dwarf buffalo, appear to us to belong ra-
erher to the species Bos Caffer, than to the above; and
will be therefore considered separately under that article. See
Caffer.

Bubastis, or Bubastus, in Ancient Geography, a
famous town of Lower Egypt, sited on the most easterly
branch of the Nile, which, from the name of this city, was
called by the ancients the “Bubastic” river, or canal.
The prophet Ezekiel calls this place “Phi-Buseth.” M. d’An-
naprufos, that the Bubastic canal of Itolom was not that
which proceed from Babastis to the sea, this being the
Pelusiac canal; but that which passed from this city to-
wards the south, and, joining with the Tranjan canal, dis-
charged itself into a lake called “Lacus Anar.” In this
place was a magnificent temple dedicated to Diana, who,
in the Egyptian language, was denominated “Bubastis,”
and hence has been derived the name of the city.

Bubastis, in Mythology, a name or attribute ascribed from
the Egyptians to Isis, or the moon, which, being perfomi-
ated, was regarded as a distinct deity, and gave name to
the city above-mentioned, whither the people resorted from all
parts of Egypt, at a certain period of the year. The symbol
of this deity was a cat, which was fed by the priests with fa-
cred food, and, when it died, embalmed and carried in pomp
to the tomb prepared for it. To this fabulous circumstance,
the veneration manifested by the Egyptians for the cat has
been ascribed. In the language of the priests, Babastis was
represented as the daughter of Isis; and hence the Greeks,
who honoured the moon by the name of Diana, bestowed
also on this Egyptian divinity. Accordingly Herodotus
(lib. ii.) says, that Babastis was called Diana by the Greeks;
and to her the Egyptians attributed the office of afflicting
pregnant women. The Greeks and Latins ascribed the fame
to Diana. See Horace, lib. iii. od. 22. According
to the Greeks, Diana was the daughter of Jupiter and La-
tona; and Babastis sprung, according to the Egyptian my-
thology, from Oitris and Isis. Babastis was called by the
Greeks Alithyia, or Inuina, from her preying over
child-birth; and the Egyptians adored her under this name
in the city of Lithyia, situated near Latopolis. Plutarch,
in his treatise of Isis and Oitris, says, that at the festivals
celebrated in honour of Bubastis, they burnt men alive, call-
ing them Typhoons, and throwing their ashes to the winds.

Amasis, says Porphyry, in his discourse of abstinence, who
visits the same fact, abolished these sanguinary facricies, and
established figures of wax of the natural size for the human vic}-

ents, &c., on the other hand, contends (ib. ii.), that the Egyptians were never guilty of this crime. "How can a people," says he, "who can scarcely prevail upon themselves to sacrifice a few animals, shed human blood upon the altars of their gods?" In order to reconcile these contradictory testimonies, Savary conjectures, that the pastoral Arabs, who subjugated Egypt, long before the arrival of the Hircetides, brought with them that barbarous custom, which had been established among them from remote antiquity; and as an evidence of the probability of this opinion, it is suggested, that the Egyptians abstained from shedding human blood, as soon as the Pharaoh Amasis had taken Heliopolis from these ferocious conquerors, and had driven them to the frontiers of Arabia.

It has been questioned, how Bubalis could be called the daughter of Isis, as she was also the symbol of the moon. The Egyptian theology, says Savary, explains this apparent contradiction. Isis was the general appellation of the moon, Bubalis a particular attribute. The fun, in conjunction with the star of the night, formed the celestial marriage of Osiris and Is; the creccent, which appears three days after, was allegorically dyed their daughter. In this light, the Hebrews called the same phenomenon "the birth of the moon"; and to the same purpose Horace says, (od. 27. lib. iii.):

"Celo fepinas si tulris manus,
Nacorit lunâ, rudica Phidyle," &c.

Hence we may deduce the reason why, in the city of Hithia, where Bubalis was adored, the third day of the lunar month was consecrated by a particular worship. On this day the moon assumes the form of a creccent; and therefore the Egyptians celebrated a solemnity in honour of Bubalis, which in their tongue signified "New Moon." The creccent with which her head was crowned, obviously expresses the intention of the priests in creating this symbo-

BUBASTUS (Cramer), in Entomology, a variety of Sphinx daidyma, Fabr. See Daidyma.

BUBBLES, Bollé, in Phystis, little round drops or vesicles of any fluid filled with air, and formed, either on its surface, upon the addition of more of the fluid, as in raining; or in its subsidence, upon a vigorous intense com-
nition of its parts.

Bubbles are dilatable or compreensible, i.e. they take up more or less room, as the included air is more or less heated, or more or less pressed, from without; and are round, because the included aura acts equally from within all round. Their coat, or cover, is formed of the minute particles of the fluid, retained either by the velocity of the air, or by the brike attraction between those minute parts and the air. See Colour.

These little bubbles, rising up from fluids, or hanging on their surface, form the white scum at top; and these same bubbles form the fleas, or vapour, flying up from liquors in boiling, &c. the manner of which see under BOILING, VAPOUR, &c.

Buble, in Commerce, is a cant name given to a sort of projects, for the raising of money on imaginary grounds; very frequent in the years 1718, 1719, 1720.

The pretended design of these undertakings was, to raise a flock, for the retrieving, letting on foot, or carrying on some promising and useful branch of trade, manufacture, machinery, or the like. In order to which, proposals were given out, shewing the advantages of the design, and inviting persons into it. The sum necessary to carry on the affair, together with the profits expected from it, were di-

vided into a certain number of shares, or subscriptions, to be purchased by persons disposed to adventure therein. Th real design, in some, was to raise a sum for the private advantage of the subscribers, to be laid out by them in the South-sea stock, &c. in hope, by the rise thereof, to be able to refund the subscribers' money, with profit to themselves. In others, the design was absolutely to defraud the adventures of their subscription money, without any view to re-

stitution. There was a third kind somewhat different: the projectors of these, to proceed the more securely, proposed to have books opened, and subscriptions taken at some time to come; and in the mean time took money by way of premium, to entitle persons to be admitted subscribers, as soon as the affair should be ripe for dividing into shares. Several thousand shares were thus very frequently bestowed in one day; and premiums, from one shilling to some pounds, paid thereupon to the profits of the projectors.

The number of bubbles, and their qualities, are very ex-

BUBBLING WATERS. See WATER.

BUBBOLIA, in Ornithology, a synonynous name of the homos, unua caps, which see.

BUBEREZNOUSKOE, in Geography, a town of Rus-

fian Tartary, on the river Zuks, 32 miles north of Arkad-

BUBIL, in Ornithology, a species of Turdus, of a brown colour, with a black longitudinal band behind the eye. Gmel. This inhabits China, and is the only long-bird that is naturallly an inhabitant of the Chinese dominions. It is the same species as the bosil already described. See Bou-

BUBLITZ, in Geography, a town of Hinder Pomerania, in the principality of Câmain, a miles S. E. from Collin. This small town, belonging to a bailiwick of the same name, lies on the Gozel, not far from the borders of Poland. In 1605, and again in 1682, it was wholly consumed by fire.

BUBO, in Anatomy, is sometimes used to denote that part otherwise called inguic, or groin.

Bubo, in Ornithology, a species of Strix, or owl of the eared tribe, known in this country by the name of the great eared, or horned owl. This bird is the largest species of its tribe, being in point of size almost equal to the eagle. Wil-

Slyghby for this reason calls it the eagle-owl. The body of this creature is of a tawny colour, very beautifully variegated with lines, streaks, and speckles of black, brown, cincereus, and ferrugineous. The wings are long, the tail short, and marked with dusky bars; legs thick, covered down to the extremity of the toes with a thick and close down of a telfa-

BUBO
eccos colour. The claws are large, much incurvated, and of a dusky colour.

This bird is of a solitary disposition, resorting almost constantly in the depths of extensive woods, in ruined edifices standing in lonely situations, or among rocks that are difficult of access. It therefore abounds most in woods and mountainous countries. There are few instances of it having been observed in Britain. Once or twice it has been seen in Scotland, and another time in Yorkshire. In France it occurs more frequently, but is still left to there than in Germany, Sweden, and Lapland. Besides the European variety, which is found generally disturbed over the continent, there are three other very distinct varieties of the Bubo. The first is the Athritic, Bubo Athriticus, Linnaeus, which is often an unguous, and in admitting to be nothing more than a variety of Bubo. This is the grand doc 'd histoire of Buffon, and great bird of from Atlas figured by Edwards. Albin names it the black-winged bird, in allusion to the blackish colour of the wings; the whole plumage being of a darker colour than in Bubo, but the wings especially. This bird is further distinguished by the legs which are shorter and weaker, but the claws are large and sharp; the face is of a whith grey colour. Another variety, le grand doc de France, differs only from the Athritic variety in having the legs bare of feathers, and both the legs and foot weaker. The existence of the last mentioned variety exists principally upon Marcgrave, who describes it under the Brusilian name of japhetis. He informs us it is the size of a goose, with a head like that of a cat; the eyes shining like crystal, with a yellow circle. Near the aperture of the ears it has several pointed feathers, two fingers long, which being movable can be erected at pleasure. The tail is broad, the wings not reaching to the end of it. Legs covered to the feet. Colour of the bird variegated with yellow, blackish, and white. This is the variety. Bubo magelanicus of Gmelin.

It should be further added, that the Virginian owl is considered by Buffon to be a mere variety of the species Bubo; but the two birds differing only in the position of the ear-like tufts of feathers on the head. We must allow, that it admits a doubt whether the Virginian owl be in reality a distinct species from Bubo, or not.

Bubo, in Surgery, is a term derived from the Greek Bubo, bignon, which among the ancients had various significations; viz. the inguinal region or groin; an inflammation and swelling of the absorbent glands in the groin; an inflamed or suppurring gland at the bend of the elbow, or under the armpit; a phlegmonous tumour behind the ear, in the neck, or in some other external part of the body, accompanied with febrile symptoms, &c. Vide Defin. Med. Corhiz. et Elcemon. Hippos. Fust. Art. Bubo.

As the remote causes and consequniences of buboes are various, so there have been numerous pathological distinctions introduced; many of which, however, are of but little importance to the practical surgeon: for example, lentigine bubo, malignant bubo, phlegmatic bubo, lymphatic bubo, gangrenous bubo, serofusus bubo, variolous bubo, febrile bubo, erythematous bubo, lymphomatic bubo, idopathic bubo, confecutive bubo, &c. &c. The principal indications of buboes are not so much governed by the supposed character and name of the local disorder, as by the nature and tendency of its remote cause: which being detected and removed, will very seldom leave any doubt as to the choice we should make of topical remedies. To describe all the possible causes, symptoms, concomitants, and secondary effects of buboes, in whatever part of the body they may arise, with their various modes of treatment, would be to write a large volume.

Our present business will be, to give only a short account of the principal diagnostic signs of buboes, and their surgical management in ordinary cases.

Bubo are distinguished from other tumours by one or more of the following circumstances:

1. By their local situation. They are only to be found in the course of the lymphatic vessels; i.e. chiefly along the inner side of the leg and thigh, ascending to the groin; also upon the under surface of the arms, going towards the axile; or, upon either side of the neck, and underneath the lower jaw.

2. By their form and structure. These glands are usually roundish or oblong; at the beginning of the inflammation, and for a short time after, they are hard, or but slightly compressible; they are movable among the cellular membrane, by which they are surrounded; they have very little sensitivity on being touched, until the inflammation advances considerably; they are not, at first, attended with redness, or dilatation of the superficial skin; and when they are fairly suppured, the matter (being confined with a distinct capsule) does not recede upon pressure, like the pus in a lumbar abscess, &c.

3. By their progress and termination. They are commonly slow in taking on the inflammatory state, and in advancing to complete maturation. The symptoms will frequently remain a long time, even when their exciting cause has been apparently removed; and the discedent absorbent glands will be apt to inflame repeatedly, with longer or shorter intermissions, after their natural structure has been once disregarded.

4. By the manner of their first appearance. Buboes often appear in clusters, accompanied with induration and enlargement of the neighbouring lymphatic vessels, which resemble tense cords under the skin; they never arise suddenly, like ruptures and false aneurisms, alluming a large bulk in a very short period; they may generally be ascribed to the presence of an acid matter, or other cause of local irritation, affecting the adjacent orifices of the absorbent vessels; though, occasionally, buboes will originate from morbid action excited in the glands themselves by cold, &c. or by some vitiated and poisonous fluid, which, after circulating through the system of blood-vessels, is deposited in the glandular substance.

We have known a small crural hernia in a strangulated and irreducible state, mistaken by a celebrated practitioner for an enlarged and indurated lymphatic gland. An incipient true aneurism has been also treated as a suppurating bubo, and even been advised to be opened with a lancet, to the great hazard of the patient's life. Another mistake, not much less serious than these, we have likewise witnessed; viz. that of the operation for an aneurism being proposed at an hospital, in a case where the patient had had deep gladiolar abscesses or buboes situated over the femoral artery, which might therefore communicate a feeling of pulsation to the examiners. This patient, having been terrified at the proposed operation, left the hospital abruptly, and languished for some months under repeated evacuations of pus, &c. from the discedent glands. His disorder was not clearly understood, until after the man's decease, when it was minutely inspected, and proved to be as stated above. Such cases shew the great difficulty, as well as the importance, of forming a just diagnosis of glandular affections under particular circumstances.

We shall now suggest a few hints for the general management of buboes.

Treatment of a Simple Bubo.

All kinds of buboes may be included under two heads; the simple and the complicated. In the former, we are to
to suppose there is no malignity arising from the presence and action of any poisonous matter or acrimonious fluid in the bubo; for when that is the case, regard must be paid to the existing cause, and peculiar means should be adopted, with a view to remove the latent virus from the system.

A simple bubo generally terminates, either by resolution or suppuration. There are circumstances, under which no art can prevent a suppuration; but, whenever it can be prevented, we should endeavour to resolve the tumour, by what are called dissecutum or antiphlogistic means. The most powerful remedies of this class are, local bleeding by leeches, cold fumigation applications, perfect rest of the member affected, saline purgatives, and moderate or sparse diet. But, if the inflammation be not considerable; if the tumefied gland remain indurated; and there be no obvious source of topical irritation, which we hope to get rid of by the gland maturing; we may then, with a design of resolving the induration, employ lightly stimulating means: such as, dry cupping, electrical sparks, volatile liniment, camphorated oil, mercurial friction, warm farinaceous poultices, and fomentations, &c. At the same time we should direct the patient to use rather a generous diet, with warm clothing, and moderate exercise.

Suppose, however, that the dissecutum gland goes on to a state of suppuration, which often will happen in spite of all the efforts we can employ to obviate it; a condition arises, when the pus has formed, whether or not the abscess should be opened? Some surgeons advise us, in all cases, to leave buboes to themselves, to let them burst, and never interfere with the natural process. This conduct, or rather negligence, we do not wholly approve; for it often occurs, that the pus infiltrates itself widely before it finds vent; and then, perhaps, only oozes by little and little, while the skin remains hoary, scedoid, and unhealthy. On the other hand, if a simple incision be made with a lancet through the skin, the fore will not always heal readily, and the surgeon incurs blame for not perfecting what he began.

The common rule to be adopted, and which we have observed to be followed with the best effects, is, to let the tumour break of itself, if it be situated in the face or neck, where we always will to avoid a scar; but in other cases, to open the abscess with a cadle, in preference to the knife, in order to destroy a small circular portion of skin. If the gland underneath be very much indurated, and the suppuration does not soon come on kindly, nor the healing process advance, we apply red-nitrate of mercury, either by itself, or mixed in some ointment, every day, until the fore assumes a more healthy aspect; still continuing the cataplasm, as long as the morbid hardness remains. See Caustic and Abscess. Should the edges become callous and indolent, not being disposed to cicatrice, they may be now and then touched with the cadle, or with an echiromatic lotion. Attention must be paid likewise to the patient's ordinary state of health, and such a plan of conduct pursued, as may be indicated by the existing circumstances.

Treatment of the complicated Bubo.

A bubo may be dependent on another disease; and is then to be considered not as a local or primary affection, but as symptomatically of the original malady. Buboes are extremely common, as a symptom of the venereal disease, plague, scrofula, measles, &c.

In the last venereal, indeed, it but seldom (in comparison with other symptoms) occurs as a sequel of the general contamination, but mostly precedes it. The syphilitic infection, very frequently produces buboes in the first instance, before the whole system has been vitiated; though, in some few cases, this order is reversed. And, whenever we believe the venereal bubo to be a primary or local disorder, unattended with absorption of the virus, our treatment should be much more lenient and topical than in other cases, where we suspect the contrary. See Lues Venera, and Syphilis. We are perfectly convinced, that great mischief has been done by the indiscriminate and free use of mercury in venereal buboes, especially if they have exiled only a short time. Innumerable facts prove that other means, besides a course of mercury internally, will cure venereal buboes; and in particular we may appeal to the effects produced by nitric acid, as recently detailed by Dr. Rollo, Mr. Pearson, Mr. Platt, Dr. Beddoes, and Mr. Blair.

With reference to this subject, and to show that a salivation has not been universally regarded as necessary for the cure of syphilitic buboes, we shall quote the words of the medical gentlemen of St. Thomas's hospital, who thus express their opinion in a little work printed for the use of their pupils, A. D. 1775.—"If the patient has a suppuring bubo, you should not only wait until it is suppurred and opened, but until it be so near healing, that you may be sure it will be cicatrized before the salivation be over. From a neglect of this caution, you will sometimes have tedious, painful, and plagueodic fores remaining. Mercury will often exasperate than dispel them to heal." See General Rules in raising a Salivation, &c. p. 4.

Whatever be the nature of the disease which occasions buboes to arise, we should principally direct our attention to that disease, and not to the treatment of the local symptoms. Consequently the remarks we have to offer on the management of pellucidal buboes, serofoul buboes, &c. must be deferred for other articles in the Cyclopaedia. See Plague, Fever, Scrofula, and Measles.

Gen. Char. Col. Umbel univerfus, of about ten rays, the middle ones shorter; partial, of from fifteen to twenty rays. Indeovul univerfus, of five leaves or more. Leaves lanceolate-acuminate, spreading, equal, much shorter than the umbel, perennial; partial with rather more leaves of the same shape, as long as the partial umbel. Perianth purpureus, scarcely visible. Flowers all fertile, forming an uniform umbel. Cor. petals five, lanceolate, inflected. Stam. filaments five, fimple, as long as the petals; anthers fimple. Pericarp, germin ovate; inferior; styles two, brifkit-shaped, permanent, scarcely the length of the corol, spreading and refpected; flimbus obtuse. Pericarp none; fruit dividing into two, crowned. Seeds two, ovate, flat on one side, convex on the other, flattirad.

Eff. Char. Fruit ovate, flattened.

spreading near the surface of the ground. **Umbs** terminal, the stem and branches short, white; peduncles and leaves of the involucre pubescent. Miller and La Marek. **Sclerotic-acute**, of a bay-brown colour; ovate, large in the winter, gummiferous. Like B. introduced (lem fig. 2). The seed is barbed.

**J. F. Smith**

**B. globifera**, a low perennial plant with the habit of a small fern. Stem about a foot and a half high, cymidrical, glabrous, but little branched. **Lower leaves large**, tomentose, with entire margins. &c.

---

**Propagation and Cultivation.**—**B. maceedum** is propagated by seeds, grown in light sandy soil, either early in the autumn, or in April; if the scapes prove hot and dry, the ground should be shaded in the middle of the day, and frequently watered. In the beginning of October, the plants should be transplanted into a warm dry border, and a few of them put into pots to be sheltered under a frame, in case the winter be severe. The seeds of galbanum and gummi-ferum should be sown in pots filled with light loamy earth, as soon as they arrive. If it be in autumn, they should be kept during the winter in a bed of briers' bark, where the heat is sustained. In spring, the plants will come up, and in April, should be carefully transplanted into fresh pots filled with the same kind of earth. After having remained in the bark till they have taken root, they should be gradually enured to the open air, and may be placed in June with other exotical plants in a sheltered situation. In winter, they must be kept in a green-house, where they should have but little water. Miller's Diet.

**Bubon**, in Ancient Geography, a town of Afa Minor, in Caballia, over against Caria. This city, according to Pliny, (I. v. c. 27.) was situated in the vicinity of Great Cythra, and had, with this and two other cities, formed a league, offensive and defensive, called the "league of the four cities." When the prator Murena, in the year of Rome 670, dismembered the state of Cythra, the town of Bubon was annexed to Lycia. According to Steph. Byz., this town, and also that of "Balbuth," derived their names from the pirates who founded them.

**Bubonium**, in Botany, Tabern. See Inula Salicinus. **Bubonius**, Lapis, in Natural History, is a figured stone, in shape resembling an owl's head, of a flinty sub stance, black within and cinnereous without; it was thus denominated by Dr. Plott, having not before been named by naturalists. Plott's Oxford, ch. v. § 45.

**Bubonocelis**, in Surgery, is a tumour in the groin, formed by the protrusion of the intestines, or omentum, through the openings designed for the passage of the spermatic cord, in the male, and the round ligament in the female.

It appears first in the groin, at an aperture, situated midway between the symphyses pubis and superior spinosus processes of the ilium, and which may be properly called the superior abdominal ring, and then passing obliquely downwards and inwards, it emerges at the inferior abdominal ring in the tendon of the external oblique muscle, and appears within the femur. When placed in the groin, surgeons usually call it the inguinal hernia, and when it has extended into the femur, it is termed femoral hernia. The protruded parts are contained in a fascia formed by the peritoneum; and when the tumour remains in the groin, it is placed under the tendon of the external oblique muscle, but when it descends into the femur, it is covered, both by a fascia given off by the external oblique muscle, and by the cremaster. The spermatic cord usually passes behind the fascia, through its whole course, but it has been found in some instances divided by it, and in others, passing before the tumour. The epigastric artery is placed near the mouth of the fascia, sometimes on the inner, but most frequently on its outer...
outer side. This hernia may be distinguished from other diseases of the ferotum, with which it is liable to be confounded, by the following marks:

1. By its dilating under coughing. 2. By its disappar- ing in the recumbent, and re-appearing in the erect posture.
3. By the gradual progress of the disease from the groin to the ferotum. 4. From its feel, which is irregular, and doughy, where omentum is contained, but elastic and regular, if it contains intestine; and where the intestines return into the cavity of the abdomen, it recedes with a gurgling noise.

The inguinal hernia is more frequent on the right, than on the left side, probably, because our strongest exertions are made on that side; and the inguinal hernia in the male is more frequent than any other species, on account of the magnitude of the abdominal rings.

This hernia exists in the three following states:

1. Retractile, when the parts can be returned into the cavity of the abdomen. 2. Irreducible, when they cannot be returned. 3. Strangled, when they are inflamed and obstructed by the effects of pressure.

In the reducible state, a frett truss must be applied, the pad of which should press upon the upper abdominal aperture; for the object in wearing it is to close the communication between the hernial sac, and the abdomen, by adhesion, which can only be effected by the pressure being applied upon the mouth of the sac. Trusses are faulty in this re- spect, being made to press upon the pubis, instead of midway between the pubis and sphenous process of the ilium. A double truss is required if there are two hernias; the con- striction of which differs from the others, in having two pads instead of one.

When irreducible, it grows to an enormous size, the ferotum often becomes disfigured, and the person is always liable to accidents. It is therefore necessary that some means should be adopted to prevent its increase. If it is an omen- tal hernia, a frett truss may be safely worn, which will prevent any further protrusion; but if it is intestinal, a bag truss should be applied, which ought to lase upon its fore part, and thus, by preventing a constant pressure upon the part, any increase of the tumour is prevented, and even its size will gradually diminish.

The strangulated state is produced by the pressure, either of the abdominal ring, of the mouth of the hernial sac, of the edges of the aperture surrounding the mouth of the sac, or by a cord formed by adhesion within the sac, which be- comes entwined around the intestine.

Whatever is the cause, it becomes necessary to liberate the part from pressure, or the person cannot long sur- vive.

For this purpose, it is proper to put the patient in a supine position, with the body a little bent, and the thighs raised to a right angle with the spine; so as to relax the rings through which the hernia has passed. The surgeon then embracing the lower part of the tumour with his right hand, and applying the fingers of the other opposite the orifice of the sac, kneads the swelling into the cavity of the abdomen. If this plan, after a trial of a quarter of an hour, does not succeed, the patient should be bled copiously, and put in a warm bath, and when faint from the operation of both the cau- ses, another attempt to return the tumour is to be made. If this is unsuccessful, a tobacco ointment composed of half a drachm of tobacco, infused in a pint of boiling water, is to be injected, and after some minutes should be repeated, if the ill has produced but little effect in exciting nausea and fainting. Another, and often successful mode of attempting the reduction, is by the application of ice enclosed in a bladder, and laid on the part; but if the abdomen is fore- upon pressure, no time should be lost in any of these trials, but an operation to liberate the bowels should be immediately performed, in the following manner: The patient is to be placed on a table three feet six inches in height, the body to be horizontal, and the legs hanging from the knees over the table, and the surgeon, standing between them, makes an incision from the upper part of the tumour through the skin, and then successively and cautiously, through the fascia and cremaster muscle, and this exposes the surface of the hernial sac. This being pinched up between the fingers, is to be opened by a very small incision, and a director being introduced, the sac is to be cut to within an inch of the ab- dominal ring, in the oblique muscle to its lower part. The intestine or omentum is thus exposed, and a small quantity of fluid generally escapes. The finger is then to be passed into the sac towards the abdomen, and the feast of the struc- ture examined. If the structure is at the abdominal ring, the probe-pointed bistoury should be passed between the sac and the ring, and the latter only cut in the direction of the tumour, and no danger whatever results from doing this.

And, if the structure arises from the pressure of the parts forming the upper aperture, the knife is to be passed in the same direction as before, but further under the tendon of the external oblique, and the upper part of this aperture is to be cut in the same direction as the former. But when the mouth of the sac itself girt the contents, it must be di- vided as follows: The finger is to be thrust within the sac to the structure, and then the probe-pointed bistoury carried along the middle of the finger is infiltrated within the structure, which is to be cut upwards or forwards at the middle of the anterior part of the hernial sac. The epigastric ar-tery has been found on either side of the mouth of the sac, but it is never situated on its anterior part, and this, there- fore, is the part which should always be cut.

When a band is entwined around the intestine, or omen- tum, it is safely seen, and as ready divided.

The structure being divided, and the intestine or omentum being found free from mortification, they are to be returned into the cavity of the abdomen by small portions, and by gentle pressure; but if the quantity of omentum is large, a portion of it should be cut away, and ligatures applied upon the divided vessels.

When the hernia is very large, and has been long irre- ducible, it is right to divide the structure at the abdominal ring, (which is in a large hernia the usual seat of the struc- ture) without opening the hernial sac. The incision for this purpose is to be made through the skin, over the neck of the tumour, so as to expose the ring and the fascia, which it sends off: an opening is to be made through the fascia, and a director passed under the abdominal ring, which being di- vided, the contents of the tumour will be liberated from pres- sure.

When an inguinal hernia is so small as to extend no further than the upper part of the ferotum, the operation is to be be- gun midway between the pubis and the ilium over the tumour, and the incision carried as far as the hernia extends. The tendon of the external oblique muscle which is exposed by the division of the skin, is next to be cut through, and the hernial sac being then seen, is to be opened in a very cautious manner. The structure which is situated, either in the sac itself, or occasioned by the edges of the upper ring, is then to be cut in a direction parallel with the linea alba.

The inguinal hernia in the female is not so frequent an occurrence as in the male, because the abdominal rings are less. It passes through the same apertures as in the male, and when large, extends itself into the labium pudendum. It requires the
the same trunks in the reducible state, as that worn by the male, and when triangular, it demands the same means
for reduction. If the operation is required, it is to be per-
formed in the following manner. An incision is to be made
from the upper part of the tumour to the lower, and along
its middle, and when the skin is thus divided, a facia is
exposed which covers the sac, which being next cut through,
the sac becomes exposed, and is to be carefully opened, and
the structure felt for. If it is situated at the ring of the ob-
lique muscle, the probe-pointed bistoury must be passed be-
tween the sac and the ring, and then cut upward; but if the
structure is at the mouth of the sac, the bistoury is to be
passed within the sac, and the structure is to be felt at the
anterior and middle part of the mouth of the hernial sac.

(Guazuma Juff. 279. Ventenat 3. 1712. La Marek, Bofe.) Clavus and order philadelphia dudensandria. Nat. Ord. co-

Gen. Chas. Col. Perianth three-leaved; leaves ovate, concave, acute, reflexed, deciduous; two a little larger. Cor. Petals five, concave or hollowed, in the shape of a
pouch at their base, lengthened at their summit into a long
broad band, inserted into the perianth at the base. Nectary
a bell-shaped pitcher, divided into five equal, lanceolate, sharp,
minute, upright segments, spreading a little at the tip.
Stam. Filaments five, filiform, upright, bent outwards at
the tip, outwardly falcated to the perianth, and alternate
with its segments, trifid at the tip; anthers three on each
filament, two at the tip on each side, the third a little lower,
each placed on one of the divisions of the filament; the cells
margined. Fil. germ superior, roundish, hispid; Ayle fili-
form, about the length of the filaments; stigma simple,
bearded, but not divided. Pericarp, capsule, (Drupe, La
Marek) subglobose, woody, mucrinated all round with club-
shaped tubercles, punched with a tenfold fimbry of small
transverse holes, five-celled, valvifers, not opening; part-
tions woody-fibrous; cells covered on the inside with a thin
membrane. Seeds numerous, angular, almost reniform,
attached in a double row in each cell to the common central
receptacle.

Olf. Juffieu, Ventenat, La Marek and Bofe call the five
segments of the perianth, barren filaments, and describe its
lower part as a tube formed by the union of all their ten
filaments. Schreber says, that the capsule is terminated by a
five-rayed leafy flap; but there is no appearance of such an
appendage in La Marek’s figure, nor is it mentioned by any
other author. According to Swartz, the rind is perforated
like a fieve, referring, doubtless, to Schreber's ten-fold
series of little transverse holes, improperly translated by Mr.
Martyn, dots, through which we presume, the ripe seeds
escape; and, if we rightly understand Schreber’s rather ob-
scure description, there is one for each seed.

Eff. Char. Perianth three-leaved. Petals five, lengthened
into a biphid awn. Authors three on each filament. Stigma sim-
ple. Capsule mucrinated, perforated with holes, five-celled,
valvifers.

Species, B. Guazuma, clav-leaved Bubroma, or baldard
Reichelb. Swartz obf. 291. Brown Jam. 306. 1.) La
Marek, Pl. 617. A tree forty or fifty feet high. Trunk
nearly the fize of a man's body, covered with a dark-brown,
furrowed bark. Branches extending nearly horizontally;
somier once leafy, tomentose. Leaves alternate, ovate, acu-
nitate, a little heart-shaped, obtuse and unquerally ferrated,
glossy, bright green on their upper, and pale on their under
surface, with a strong midrib, and several transverse veins;
petioles tomentoche, a little thicker than the leaf; Ripules
linear-awl shaped, approximating to the branches. Radicem
oryzifo, auxiliary. Flowers small, pale yellow; axu
purpurea. A native of the East and Welf Indies. In the
West Indies it is planted in rows to make a shady walk. For
this purpose, it is pollarded at the rainy season, when nine
or ten feet high, within a month of which operation, it is
covered with foliage, and forms a head more than six feet in
diameter. As it is liable to suffer by the wind, its upper
branches are lopped every five or six years. Cattle are fed
on its leaves and fruit in dry seasons, when other forages
is scarce. Its seeds are very muscillaginous, but agreeable
to the palate. The wood is light and easily wrought, and
is employed for coach pannels. A decoction of the inner bark
is very glutinous, and very like that of the elm. It is said
to be excellent in the lembantia, a disorder to which the
arguments are much ful fect.

Propagation and Culture.—This tree was cultivated in
England by Mr. Miller, in 1733. La Marek’s description
was formed from a living plant which flowered in the lobe
of the royal garden at Paris, about 1788. The seeds must
be sown in a hot bed in the spring, and when the plants
are fit to be removed, should be put into separate pots, and
bured in the same way as the coffee-tree.

BUBRY, in Geography, a town of France, in the de-
partment of Morbihan, and distriet of Lorient, 10 miles
N.N.E. of Hennebont.

BUCK, in Geography, an English antiquarian, was
the descendant of an ancient family, and was born in
Lincolnshire towards the close of the 16th century. In
the reign of James I. he was made one of the gentlemen of
his Majesty’s privy chamber, and knighted. The work by
which he was chiefly distinguished was his “Life and Reign
of Richard III. in five books,” in which he takes great
pains to vindicate that prince’s character. But in this
attempt he evinces more zeal than judgment, and his work
is a pedantic, rhetorical panegyric, rather than a judicious
and impartial history. It is printed in bishop Ken nett’s col-
lection of the English Historians, London 1706 and 1719.
He was also the author of “The Third Universitie of Eng-
lund; or, a Treatise of the Foundations of all the Colleges,
ancient Schools of Privilege, and of Hones of Learning
777; and of Liberal Artts, within and about the most famous Citie of
London, &c.” written in 1712, with a view of shewing
that all the arts and sciences are taught in the metropolis,
and annexed to the edition of Stow’s Chronicle by E.
Howes, London, 1651. He composed likewise a treatise of
“The Art of Revels.” Camden represents him as a
perfon of excellent learning, and acknowledges obligations

BUCA, in Conchoology, an old name for buccinum.

BUCA, in Ancient Geography, a town of Italy, in the
country of the Frentani, situate on the sea-coast.

BUCA EPHALALUM, in Botany. Pluk. See Sar-
RACENIA.

BUCAO, in Ornithology, a name given in the Philippine
islands to a species of creech-owl, which is the size of a
peacock. It is very common in those islands, but wholly
unknown to us. It is a very beautiful bird, but makes a
hurricane noise in the night.

BUCADEFITITI, or BUCARDITA, in Natural History.
a name given by many authors to a fone in some degree re-
sembling the figure of an ox’s heart. It is usually of the
substance of the coarser stones, and is no other than a quanti-
ty of the matter of such stone received while moist into the
cavity of a large coeleck, and then affuming the figure of the
the inside of that shell, the depression of the head of the cockle, where the cardo or hinge of this shell is, makes a long and large dent in the formed male, which gives it a heart-like shape. Plott mentions a bucardite, which he found at Stratford in Staffordshire, which weighed twenty pounds, though broken half-way, curiously reticulated, with a white spar-coloured lown. Nat. Hist. Oxf. chap. v. § 745.

BUCARDIUM, in Conchology, with old authors, a name applied to the bull's heart chama, Chama cor of Linnaeus; and, in a more general sense, as a generic title for all the cordiformes, or heart shells in the chama, the vortex, and the area genera. Bucardi of the French, comprehends the subcordiform shells of the genus Cardium.

BUCArelli, in Geography, a large bay on the North-west coast of America, discovered by Don Juan de Ayala, a Spanish navigator, in 1775. It was named "The entrance of Bucareli," by Don de la Bodega and Don Manuelle, in honour of friar Don Anthony Maria Bucarelli, of Urfa, viceroy of Mexico, and was visited again in 1779, by two frigates under the command of Don Ignace Arteaga and Don de la Bodega, in 1779. The entrance of this bay is situated, according to the determinations of La Perouge in 1786, in about 15° 15' W. long. from Paris, and according to the observations made by Capt. Cook in 1778, of the coasts near this entrance, very nearly 22° E. long. from Greenwich, or 135° W. from Paris, and in N. lat. 55° 15'. The Spanish commandant caused a complete survey to be made of this gulf, which runs upwards of eight leagues inland, contains several large islands, and presents in its circumference 11 fine harbours, where ships may anchor with safety. Maurelle says, that he does not know a single port in all Europe that could be preferred to that of Santa Cruz, which was the name they gave to the port at which their frigates anchored, and which is situated at the entrance of the gulf on its east coast. Maurelle met with but few habitations in his expedition; seeing only one village, situate at the top of a steep mountain, which could only be ascended by a flight of steps, or rather wooden ladder, whence, if the foot slipped, one must fall down the precipice. For an account of the inhabitants, &c. See Cross Sound.

BUCAROS. See Alcarrazas.

BUCALES glandule, in Anatomy, the mucous glands of the mouth, which are situated beneath the membrane which lines the cheek. See Mouth.

BUCAANERS, or Bucaneers, a term frequent in the West Indies, properly used for a kind of savages, who prepare their meat on a grate, or hurdle, made of Brafalwood, placed in the smoke, at a good height from the fire, and called bucan. Whence, also, the little lodges, raied for the preparation of their food, are called buccanos; and the action of dreelling it bucaning.

Meat bucaned is said to have an excellent taste, the vermil colour of a rofe, and a charming smell; all which it retains many months. Oxcemia, from whom we have this, adds, that the neighbouring people fend their sick litter; that, by eating their bucaned meet, they may be recovered.

The origin of the word is referred to the people of the Caribbee islands, who used to cut their prisoners of war in pieces, and lay them on hurdles with fire underneath, which they call bucaning, i.e. roasting and smoking together: hence our bucaners took both their name, and their custom; with this difference, that what the former did to men, these did to animals caught in hunting.

The Spaniards, Savary tells us, called the bucaners in their territories mataadores, that is, killers; and monteros, that is, hunters: the English call theirs, cow-killers.

The bucaners are of two different professions: the one only hunt bulls for their skins; the other beasts for their flesh.

The art of bucaning, Oxchemia describes thus: the beast being flaid, and the bones dripped out, the flesh is cut into pieces of the length of the arm, and salted, and the next day laid on the bucan which consists of twenty or thirty bars laid across, half a foot from each other: under this they raise a thick smoke, adding the skin and bones of the beast, to heighten it.

This is found varly better than any simple fowel: because the volatile faiis of those parts are by this means communicated to the flesh, and give it such a relish, as that, after a little of this bucaning, the least palate will eat it without further preparation.

Bucaneers are usually confounded with freebooters, from whom, in fricotions, they ought to be distinguished. The ancient inhabitants of Hispianola, and the other Caribbee islands, after their conquest by the Europeans, confided four ranks or orders of persons, viz. bucaners, or bull-hunters, who scourd the woods; freebooters, who scourd the seas as pirates; buonadens, who tilled the land; and floros. Of these the two first distinguished themselves most by their military disposition, and the ravages they made, especially among the Spaniards.

The name is particularly given to the French inhabitants of the island of St. Domingo, whose sole employment is to hunt bulls or wild boars; in order to fell the hides of the former, and the flesh of the latter. The French bucaners packed their hides in bundles, which they called loads, and which consisted of those of full-grown bulls, of young bullocks, and of cows. Each load was formerly fold for about six pieces of eight rials; the French coins not being current in the island of St. Domingo. The boar meet, previously seasoned, was also fold by the bundle or pack, weighing commonly 60 pounds, at the rate of six pieces of eight per pack. It was packed up in palmetto leaves, the weight of which was deducted; so that each pack contained 60 lbs. of bucaned meat. These bucaners had also a great trade in the land of boars, which they melted and deposited in large pots, which they called "pottiches." This lard, which is called mantegue, is also fold for about eight pieces of eight per pot.

Of this article there were a great consumption and trade in the French settlements of the islands of St. Domingo, and in those of Tortuga; beside which they sent great quantities of them to the Antilles, and even into the continent of French America. There was also a great deal of it fold for the support of the crews of the ships that came from France for trading, or which the privaters of Tortuga fitted out for cruizing against the Spaniards. The Spaniards also, who had their bucaners, under the appellation of "mataadores," or "monteros," and who were employed in bull-hunting, prepared their hides after the manner of the French; and these hides found a ready market at the Havannah, a famous harbour in the island of Cuba. From hence they were brought by the flota and galleons, which touched at this port, in their return from Vera Cruz and Porto Bello, to Spain, and under the denomination of Havannah hides, were esteemed the belt of any that were brought from America to Spain.

Sometimes the word bucaner signifies also those famous adventurers of all the nations in Europe, who joined together to make war against the Spaniards in America: and, as under,...
BUCCANEERS.

under that name, their history has been published in the year 1686, by Alexander Oliver Oestenolia.

These adventurers had taken possession of the small island of Tortuga, as early as the year 1621, and found little difficulty, after having excluded the Spaniards, and fortified themselves in this island, in establishing themselves on the northern coast of Hispaniola. They at first subsisted chiefly by the hunting of wild cattle. Part of the beef they ate fresh, and part they dried; and the hides they sold to the masters of such vessels as came upon the coast, and who furnished them, in return, with cloaths, liquors, fire-arms, powder, and shot. Their dress consisted of a shirt dipped in the blood of the animals they had slain; a pair of dirty trowsers; a leathern girdle, from which hung a short fabre, and some Dutch knives; a hat without any rim, except a flap before, in order to enable them to pull it off; and shoes made of raw hides; but they wore no stockings. When the wild cattle became scarce, these buccaneers were under a necessity of turning their industry to other objects. The more sober minded among them applied to the cultivation of the ground, which abundantly required their toil; while those of a bold and reftless disposition associated themselves with pirates and outlaws of all nations, and formed the most terrible band of ravagers that ever infilled the ocean. To these ravagers, however, rendered famous by their courage and their crimes, France and England are indebted, in some measure, for the prosperity of their settlements in the West Indies.

These piratical buccaneers, assuming the name of the "Brothers of the coast," formed themselves into small clans or societies; and made their excursions in open boats, each of which generally contained between 20 and 30 men, exposed to the intemperance of the climate, and encountering alternately the freezing heat of the day, and the chilling damp of the night. The natural inconveniences, connected with this mode of life, were augmented by others arising from their licentious disposition. A love of freedom and independence, by which they were actuated to a degree of frenzy, in common with other savages, rendered the buccaneers averse from all restraints which civilized men impose upon themselves for their common happiness; and as the authority, which they had conferred on their captain, was chiefly restricted to giving orders in battle, they lived in the greatest disorder. Like savages, having no apprehension of want, and taking no care to guard against famine by prudent economy, they were frequently exposed to all the extremities of hunger and thirst. But deriving, even from their destitute, a kind of courage that defied all danger, they were transported with an astonishing degree of enthusiasm whenever they saw a fall. On the mode of attack they seldom deliberated, but it was their custom to board the ships that fell in their way as soon as possible. The smallness of their own vessels, and their dexterity in managing them, preferred them from the fire of the enemy. They preferred only to the broadside of a ship their slender prows, filled with expert markmen, who fired at the port-holes of the enemy with such exactness, as to confound the most experienced gunners. When they could fix their grappling-tackle, the largest trading vessels generally were obliged to strike. In cases of extreme necessity, they attacked the ships of every nation; but those belonging to Spain were especially the principal objects of their piracy. They thought, that the cruelties, which the Spaniards had exercised on the natives of the new world, furnished a sufficient apology for any violence that could be committed against them; nor did they ever embark on any expedition without publicly praying to Heaven for success, nor return loaded with booty without solemnly returning thanks to God for their good fortune. This booty was originally carried to the island of Tortuga, the common rendezvous of the buccaneers; and at first their only place of safety; but afterwards the French went to some of the ports of Hispaniola, where they had established themselves in defiance of the Spaniards, and the English to those of Jamaica, where they could dispose of their prizes to greater advantage, and lay out their money more to their own satisfaction, either in business or in pleasure. Before the distribution of the spoil, each adventurer, holding up his hand, protested that he had secreted no part of what he had taken; and if any one was convicted of perjury, which seldom occurred, he was punished by being expelled the community, and by being left, at the first opportunity, on some desert island, as a wretch unworthy to live in society, even among the destroyers of their species.

After having provided for the sick, the wounded, and the maimed, and after having settled their respective shares, and distributed such as belonged to those who had no relations or friends, in charity to the poor, and to churches; they indulged in all kinds of licentiousness. When they were at sea, they dillufed themselves, and rapidly the spoil which they collected with so much personal danger? they replied, "Exposed as we are to a variety of perils, our lives are totally different from those of other men. Why should we, who are alive to-day, and run the hazard of being dead to-morrow, think of hoarding? Stifudious only of enjoying the present hour, we never think of that which is to come." The ships that sailed from Europe to America seldom tempt the aversion of the first buccaneers, as the merchandise they carried could not readily have been sold in the West Indies in those early times. But they eagerly watched the Spanish vessels on their return to Europe, when they were known to be laden with treasure. They commonly followed the galleons and fvela, transporting the produce of the mines of Mexico and Peru as far as the channel of Panama, and if any ship was accidentally separated from the fleet, they instantly befet her, and she seldom escaped. And they even ventured to attack several ships at once, which were commonly surrendered, when they came to close quarters; for the Spaniards considered them as demons, and trembled at their approach. The Spaniards, indeed, who armed themselves a continual prey to these various rapists, were almost reduced to despair; they left the number of their ships, and the colonies gave up their connections with one another. The buccaneers were thus emboldened; and instead of confining themselves to those invasions of the Spanish settlements, which had for their object a supply of provisoes, they determined, more especially as their opportunities of making captures by sea were diminished, to procure by land that wealth which they could not obtain on the ocean. Accordingly, they formed themselves into large bodies, and plundered many of the richest and strongest towns in the New World. Maracaybo, Campeachy, Vera Cruz, Porto Bello, and Carthagena, on this side of the continent, and Quayquill, Panama, and many other places on the coasts of the South Sea, very rarely suffered from their depredations. In a word, the buccaneers, the most extraordinary association of men that ever appeared on the face of the globe, but whose duration was transitory, subjected to their arms, without a regular system of government, without laws, without any permanent subordination, and even without revenue, cities and castles, which had baffled the utmost efforts of national force; and if conquest, not plunder, had been their object, they might have made themselves masters of all Spanish America.

Among the buccaneers, who first acquired distinction in this
this mode of plundering, was Montbars, a gentleman of
Languedoc, who conceived from his youth a violent ani-
mitivity to the Spaniards, on account of the enormities
they had committed in the conquest of the New World, and
who, determining on retaliation, embarked about the middle
of the 17th century, on board a French ship for the West
Indies, in order to join these enemies of Spain. An enthu-
siasm which originated in humanity, at length became the
source of the most unfeeling barbarity; for so much did the
Spaniards suffer from the fury of this enthusiast, that he ac-
quired the name of the "Exterminator." Michael de
Bafo and Francis Lolonnois were also greatly renowned for
their exploits both by sea and land. The most important
enterprise, in which these leaders, with eight vessels and 600
associates, engaged, was that of the gulf of Venezuela.
This gulf runs up into the land for about 50 leagues, and
communicates, by a narrow strait, with the lake of Mar-
acybo. They began (A.D. 1667.) with flooring and
taking the castle, called "La Barra," which defended this
strait, and putting to death the garrison, consisting of 250
men; and they then advanced to the city of Maracybo,
built on the western coast of the lake, at the distance of
about 10 leagues from its mouth. But on their arrival, the
inhabitants had abandoned it and removed their most valuable
effects. Here they spent a fortnight in debauchery and
riot; so that when they proceeded to Gibraltar, a town at
the extremity of the lake, to which the flying inhabitants
had retired, they found it newly fortified, and after reducing
it at the expense of much blood, they took possession only
of an empty town. Exasperated at this second disappoint-
ment, they set fire to Gibraltar; and Maracybo would
have shared the same fate, if it had not been randomized.
But previously to this random, they depopulated it of its
dwellings, and the remains of the churches, intending, as
they fled, to build a chapel in the island of Tortuga, and to
confront that part of their spoil to sacred uses. But of all
the buccaneers, French or English, no one was so uniformly
fortunate and successful, or executed so many daring enter-
prises, as Henry Morgan, a native of Wales. While de
Bafo, Lolonnois, and their companions, were squandering,
at Tortuga, the spoils they had acquired in the gulf of Ven-
ezuela, he failed from Jamaica, to attack Porto-Bello; and he
conducted his measures so well, that soon after his landing,
he surprized the town and, making himself master of the
fort, (A.D. 1668.) before the Spaniards could put them-
elves into a posture of defence. In order to reduce the
citadel, whether the inhabitants had conveyed their most va-
table property, and the plate of the churches, he recurred to
the following artful expedient: he compelled the priests, nuns,
and other women, whom he had made prisoners, to plant
the scaling ladders against the walls of the fortresses, from a
persuasion that the gallantry and superstition of the Spaniards
would not suffer them to fire on the objects of their love and
veneration. In this imagination, however, he was deceived.
The Spanish governor used his utmost efforts to destroy
every one that approached the works; so that Morgan was
reduced to the necessity of carrying the place by storm.
Having thus succeeded, he took possession of a vast quantity
of rich merchandise, and also of bullion and specie amount-
ing to one hundred thousand pounds sterling. With this
booty Morgan and his associates returned to Jamaica; and
formed a new enterprise against Maracybo. Accordingly
he collected 15 vessels and 800 men; and with this arm-
ament (A.D. 1669.) entered the gulf of Venezuela un-
observed, silenced the fort that defends the passage to the
lake of Maracybo, and found the town totally deserted;
but he discovered the chief citizens, and the greater part of
their wealth in the neighbouring woods. He proceeded to
Gibraltar, which was left desolate; however, whilst he was
attacking, by the most horrid cruelties, to extort from the
inhabitants, whom he had seized, a discovery of their hidden
treasures, he was informed of the arrival of three Spanish
men of war at the entrance of the lake. Having recon-
noitred the enemy, he considered his condition as desperate.
Nevertheless, he concealed his apprehensions, and sent a let-
ter to the Spanish admiral, boldly demanding a ransom for
the city of Maracybo. The answer returned by the admiral
was a refolute, inflicting on his infuriating his bootie and
prisoners, with leave to return to his own country, or if he
refused, announcing his fixed purpose of putting every man
on the sword. Morgan and his associates deliberated; and
they at length determined to risk any consequence rather
than refuse their bootie, which they had gained with so much
peril. As the admiral adhered to his declared purpose,
Morgan informed him, that if he would not allow him to
pass, he would find means to effect his escape without his
permission. He accordingly divided the spoil, so that each
might have his own share of it to defend; and having filled a
vessel, taken from the enemy, with bullocks, he gallantly proceeded to the mouth of the lake, and having
burnt two of the Spanish ships and captured one, he
made a feint of disembarking men, in order to attack the
fort by land, and thus diverted the attention of the garrison,
whilst he passed the bar with his whole fleet, without receiv-
ing any damage. Morgan, having disposed of his bootie at
Port Royal in Jamaica, put to sea again (A.D. 1670.) with
a larger fleet, and a more numerous body of adventurers;
and after reducing the island of St. Catharine, heered for
the river Chagres, by which he intended to advance to Pana-
ma. At the entrance of the river floated a strong fortresses;
and arrow was shot from the bow of an Indian, and lodged
in the eye of one of his associates; but Morgan, pulling the
arrow from the wound, wrapped one of its ends in tow, put
it into his loaded musket, and discharged it into the fort;
and this arrow falling on the roof of one of the houses,
which, according to the custom of the country, were con-
structed of wood, and covered with straw, set fire to it;
and thus the Spaniards were thrown into the utmost con-
fusion. After the death of the governor, who bravely
perished with his sword in his hand, at the head of a few
refolute men, the place surrendered to the assailants.
Morgan proceeded up the river to Creques, and thence by land to
Panama, and, after several reconnaissances, took quiet posses-
sion of it, and deliberately pillaged it for some days. Here he
met with a fair captive, who inflamed his savage heart with
love; and finding all his solicitations ineffectual, he made a
forcible attempt on her person. "Stop, ruffian," she ex-
claimed wildly, and prising from his arms: "Stop! thinkst
thou to ravid from me my honour, as thou hast wrenched
from me my fortune and my liberty? No! be assured that my
soul shall sooner be separated from this body:" and she drew
a poniard from her bosom, which she would have plunged into
his heart, if he had not avoided the blow. Enraged by this
vicious resistance, Morgan threw the female into a loathsome
dungeon, and endeavoured to subdue her by severities. But
his followers became clamorous on account of his detention
of them to no important purpose, and constrained him to re-
linquish this amorous pursuit. Before their return, the
booty was divided, and the share of Morgan himself amount-
ed to 100 thousand pounds sterling. This wealth he carried
to Jamaica, and never more engaged in any piratical enter-
prise. Some have said (see Edwards's Hist. of the West
Indies, vol. i. p. 160,) that king Charles II., though he
issued public orders for the suppression of the hollities of the
bucc-
buccaneers, existed and received a share of their booty; and that this circumstance induced him to manifest peculiar favour to Morgan, to receive him graciously on his visit to England, and to confer upon him the honour of knighthood. Several other expeditions were formed by the buccaneers of the 17th century, against the Spanish settlements. Van Horn, a native of Oileud, who served almost through life among the French, was very active in his depredations. Associating, on one occasion, with 1200 other persons of the same description, and manning a fleet of six vessels, he failed to Vera Cruz, and, favoured by the darkness of the night, reached the place and landed without discovery. He and his companions made themselves masters of it without resistance; and having confined all the citizens in the churches, whether they had fled for shelter, they placed at the door of each church barrels of gun-powder, and a buccaneer with a lighted match to set fire to them, upon the last appearance of an insurrection. They then proceeded to pillage the city; and having carried off whatever they could find of value, they made a proposal to the prisoners, to ransom their lives and liberty by a contribution of 437,500. Half this money was paid them; but whilst they were expecting the other moiety from the interior parts of the country, they were alarmed by the flight of an European fleet of 17 ships, and reduced to the necessity of making a retreat, which they accomplished, by boldly falling through the Spanish fleet, carrying with them 1500 slaves. Other expeditions were concerted against Peru; and if the treachery of these numerous marauders had been directed by a skilful and respectable commander, they would have disappointed the Spaniards of this important colony. But their character prevented their union in a large and compact body, and their ready procrastination of the same object. However, they successively attacked the most considerable places on the coast of the South Sea, enriched themselves by plunder, and committed a great number of outrages. Others of the buccaneers associated with Gramont, a native of Paris, who had distinguished himself in a military capacity in Europe, and embarked with him, in 1685, to attack Camppechy. Having landed without opposition, after some resistance on the part of the Spaniards, they made themselves masters of the city; and after carrying off the treasures which they had collected in the town and its environs, and depositing them in their ships, they proposed to the governor of the province to ransom his capital. Upon his refusal they determined to burn the place, and to demolish the citadel. Accordingly they destroyed to the value of a million of logwood, which was a very considerable part of their spoil, and after this act of folly and frenzy, they returned to St. Domingo. At a subsequent period, viz. in 1697, 1200 buccaneers joined a squadron of three vessels, that failed from Europe, under the command of Pointis, to attack the famous city of Carthage. In this enterprise they succeeded, took the city, and acquired booty to the amount of 1,750,000l. After they had set fire, their rapacious commander attempted to deprive them of their spoil; upon which they resolved to massacre him; but being diverted from their purpose by one of their number, who proposed returning to the city, where their share of the plunder had been left by Pointis, they immediately failed towards Carthage. Having entered the city without resistance, they confined all the men in the great church, and demanded payment of 218,750l. which they alleged to be their share of the booty, of which they had been defrauded, accompanying their demand with threats of vengeance if it were resisted. A venerable priest ascended the pulpit, and by his eloquent address persuaded his hearers to surrender all the gold, silver, and jewels in their possession. But the sum raised falling short of that which was demanded, an order was issued for plundering the city. The adventurers, having amassed as much treasure as they could find, set fire; but unfortunately they met with a fleet of ships belonging to Holland and England, both of which nations were then in alliance with Spain, so that several of the pirates were taken or sunk, with all the cargo which they had on board their ships; and the rest escaped to St. Domingo. This was the last memorable event in the history of the buccaneers. The total separation of the English and French buccaneers, in consequence of the war between the two nations, which followed the revolution in 1650, very much weakened the force of the powerful plunderers: and the king of Spain also being then in alliance with England, repressed the piracies of his subjects in the West Indies. However the French buccaneers continued their depredations, and with no small success, till the peace of Rywick, in 1697; when all differences between France and Spain having been adjusted, hostilities were everywhere suspended; and not only the association, but the very name of this extraordinary class of men, became extinct. They were lost among the other European inhabitants of the West Indies.

Before this period, however, the French colony in Hispaniola had arrived at a considerable degree of prosperity; and Jamaica, into which the Spanish of Mexico and Peru were more abundantly poured, was already in a flourishing condition. The buccaneers found at Port Royal better reception and greater security than any where else. They could there land their booty with the utmost facility, and spend, in a variety of pleasures, the wealth produced by their piracy; and as prodigality and debauchery soon reduced them again to indigence, that grand incitement to their unimaginary industry induced them eagerly to concert fresh depredations. Thus the settlement derived benefit from their perpetual vicissitudes of fortune, and was enriched by their rapacity as well as by their profusion; by the views which led to their want, and also by their abundance. The wealth, which flowed into Jamaica through this channel, gave great activity to every branch of culture; and after the piracies of the buccaneers were suppressed, it proved a new source of riches, by enabling the inhabitants to open a clandestine trade to the Spanish settlements, whence it had its origin.

BUCCARI, Bukari, Bokari, or Bukri, in Geography, a town of Morlachia, in that district of Hungarian Dalmatia called Zengh, or Segna, belonging to Austria, and feated on a rocky eminence in the north-east part of the Adriatic. This town was declared by the emperor a free port for the commerce of the East Indies in 1786. The harbour, or rather the gulf of Buccari, or Bukaria, is commodious and safe; but a little exposed to the south-east wind, which sometimes makes it dangerous. From this place great numbers of cattle are shipped for Italy. N. lat. 45° 30'. E. long. 15° 15'.

BUCCATA, in Entomology, a species of Conops (Myopa, Fabr.). The prevailing colour of this insect is ferruginous; abdomen hooked, and grey; face veicular and white; wings clouded. Linn. Inhabits Europe.

BUCCATUS, a species of Oestrus, of a grifiose colour, with the face white, and dotted with black. Inhabits South Carolina.

BUCELLARI, a kind of loam, or cake of a circular figure, an order of soldiery under the Greek emperors, appointed to guard and distribute the ammunition-bread. The buccellarii were also called, in respect of their country, Gallograsi, or Helengalate, q. d. Greeks of Galatia; sometimes Maryandini.
Authors are much divided as to the office and quality of the buccellarii: some give the denomination to parasites in the courts of princes and great men, maintained at their table and expence. In reality, among the Visigoths, buccellarius was a general name for all clients or valets, who lived at the expense of their lords. Spelman rather supposes them to answer to what among us are called "tenants by military service."—Others represent the buccellarii as stationery soldiers in the provinces, who, when the emperor commanded, marched before and behind him as his body guard.—According to others, they were men whom the emperors employed in putting perfons to death secretly.

BUCELLATUM, formed from buceas, or buccella, a morcel, or mouthful of meat, in Ancient Military Writers, denotes camp bread or billet baked hard and dry, both for light and keeping. Soldiers always carried with them enough for a fortnight, and sometimes much longer, during the time that military discipline was kept up.

BUCCHEREST, or Bucharest, in Geography, a fortified town of European Turkey, and capital of Wallachia, seated on the river Dibravitz; the usual residence of the waywode, and the seat of a Greek archbishop. The Lutherans hold their assemblies here, under the protection of Sweden. The number of inhabitants is estimated at 60,000. N. lat. 44° 50'. E. long. 26° 45'.

BUCCINA, an ancient military metallic instrument, crooked like a horn, used in war; especially for proclaiming the watches of the night, and giving notice to the soldiers when they were to mount, and when to retreat.

The word comes from buceas, mouth, and cana, I sing; because played on by the mouth; others suppose it formed from Susam, or cuceam, which signifies the same; formed from Sus, bullcuck, and cana, I sing; because ancients made of bullocks horns: others from the Hebrew buk, a trumpet. Varro will have it to have been originally formed by anoma- tosia, from bow bow, alluding to the sound it gives. Others, with more probability, derive it from buccinum, the name of a shellfish.

The buccina is usually considered as a species of tuba, or trumpet; from which, however, in propriety, it appears to have differed, not only in respect of figure, which in the tuba was straight, and in the buccina recurved or crooked; but in sound, that of the buccina being harsher and audible to a greater distance than the trumpet.

The buccina approached nearest to the cornu, or horn: originally the two seem to have been the same; though in after times a difference arose: the name buccinum being retained to the former, and the cornu to the latter. Some also take the buccina to have been a's crooked than the cornu, which made a full semicircle.

Varro affirms us, that the buccina were also called cornu, horns; because originally made of the horns of cattle, as is still done among some people. Servius intimates, that they were at first made of goats or rams-horns; and accordingly, in Scripture, the like instruments used both in war, and in the temple, are called "rams-horns," kerem-jobal, and jopherath bujsherem, or buccinea of rams.

This instrument was in use among the Jews, to proclaim their fast-days, new moons, jubilees, Sabbath years, and the like. At Lacedemon, notice was given by the buccina when it was supper-time; and the like was done at Rome, when the grandees had a buccina blown both before they sat down to table, and after.

The sound of the buccina was called bucinus, or bucinus, and the musician who played on it, buccinator.

BUCCINA also denotes the space or extent to which the sound of the buccina may be heard.

BUCCINA auris, in Middle Age Writers, denotes the tympanum or drum of the ear.

BUCCINATOR, he that sounds or winds the buccina.

Among the Romans there was a public slave, denominated buccinator nominum, whose office it was to attend the public crier.

BUCCINATOR Musculus, in Anatomy, arises from the alveolus, containing the left grinder of the lower jaw, from the coronoid process, and from the tubercle behind the socket of the left grinder of the upper jaw; its fibres proceed over the membrane of the mouth, where it lines the cheek, and terminate extensively in both the lips and in the angle of the mouth. It may draw the lips backwards towards its posterior attachments, and when the lips are made fixed parts by the action of the orbicularis oris, it will thrill any matter intervening between the cheek and the cavity of the mouth into that cavity, for the purpotes of mastication and deglutition.

BUCCINATOR, in Entymology, a species of Hydarchus of an obovate form; colour red, black behind; tail cylindrical, yellow, and narrowed at the base.

Degree has this as acanthus caudatus. It is found on banks. The body is black beneath, eyes reddish, legs black.

BUCCINUM, in Botany. Dodon. gal. See Delphinium Confolida.

BUCCINUM, in Conelogy, a genus of univalves, described by Linnaeus as having the shell spiral and gibbous; the aperture ovate, terminating in a short canal inclining to the right, with a retinue tail or beak; and the pillar lip expanded. Animal inhabiting the shell a limax.

Linnaeus comprehends a vast number of species in his genus buccinum, which, for the sake of methodical uniformity and perspicuity, he places under several distinct sections; a mode of arrangement in which he has been closely followed by his editor, Germain, in the last edition of the Systema Naturae. We shall follow the latter writer, as usual, in the first instance, and afterwards notice certain alterations that have been made in the arrangement of the buccinum genus by other naturalists.

Amphiiacera, the first family, is distinguished by having the shell inflated, rotundate, thin, subdiagonal, and fragile. This section includes the species okarium, galea, perdis, pomum, dolium, caudatum, niveum, and elilaterum.

Cafficula caudata, in which the tail or beak is extended, short, relicted; lip unarmed externally. Many species are included in this section; namely, echinophorium, plicatum, corundum, rufum, tuberum, flammum, tellerus, decussatum, arcola, tigrinum, unudatum, catricicatum, teffellatum, penatum, maculatum, bilimentum, gibbum, ventricatum, lyrifugum, rugifugum, ponderofugum, frugatun, fucicatum, fucicicatum, ochroleumum, umbatum, eudum, litigatiun, tynthrum, and abbreviatum.

Cafficula anguliculata. Shells of this family have the posterior part of the lip prickly on the outside, but in other respects resemble those of the last section; the species are erinacoeus, glaucum, vibex, teffallatum, nodulatum, umbatun, papillosum, and glans.

Cafficula. These shells have the pillar lip dilated and thickened. The species of this tribe are few; namely, arcularium, pullus, gibusofugum, mutabile, and mericetus.

Dedici, in which the pillar lip has the appearance of being worn flat; harpa, colatum, perfoem, unudalam, patulum, hamatoma, lapillus, maragulatus, tuba, pyrum, papillosum, umbilicatum, candidum, scala, crassum, margintum, labyrinthus,

BU C

The species of the buccus genus are tamatia, cayennensis, caperitis, elegans, macrohynchos, melanodon, philippensis, niger, parvus, grandis, viridis, Lathami, fulcus, rubricapillus, zeylanicus, dubius, and cinereus; which fee.

BUCCULA, in Anatomy, the fleshly part under the chin. Some extend the name farther to the whole lower part of the face, comprehending the under part of the lower lip, with the chin and the fleshly part under it.

BUCCULA, in Antiquity, denotes the umbo of a shield, or the part prominent in the middle thereof.

It is thus called, because usually made in the form of a mouth or face, either of a man or some animal. The like figures were sometimes also found on other parts of armour, especially on the lorice and tachetaes.

BUCENI, in Geography, a town of European Turkey, in the province of Moldavia; 38 miles N. N. W. of Galatz.

BUCENTAUR, the name of a large flat-veffel, used by the Venetians, in the ceremony of spouting the sea, performed each Ascension-day with much pomp.

The word comes from B U C E N T A U R , composed of Buco, a particle of augmentation, used to denote an enormous greatness, and centaur, Jutliniani adds two other etymologies: the first from Buco, and taurus, or rather centaur, the name of one of Xenes's vessels in Virgil: the other from bucentaurus, for dentatus, a word forged to signify a veffel capable of holding two hundred men.

Jutliniani gives a very precise description of the bucentaur, which is adorned with five pillars from both sides, and gilt from the prow to the stern, also covered over head with a kind of tent, made of purple silk; and he adds, that its origin is carried up as high as the year of Christ 1311, though others trace it higher, to the year 1177, when the emperor Frederic Barbarofo came to Venice, to make peace with the republic and the pope, to which time the pope, in consideration of the services the flate had done him, in sheltering him in their city, when he had been driven out of his own, granted them several privileges; and made a present to the doge of a gold ring, which is the origin of that, yearly cast by the doge, from the bucentaur, into the sea.

It is on Ascension-day, that the doge, being advanced in the bucentaur a little way into the gulph, throws a gold ring into the sea, and says, "We marry thee, O sea, in token of that true and perpetual dominion which the republic has over thee."

In this veffel the doge receives the great lords, and persons of quality that visit Venice, accompanied with the ambassadors, and counsellors of state, and all the senators seated on benches near him.

The archdeacons Maria Josepha, married to the prince of Saxony, on the day of her entry into Drifden, was received in a magnificent galley, finely rigged, and called a bucentaur, because built after the model of that of Venice.

A veffel of the same name, as large and magnificent as that of the Venetians, was constructed by order of the elector of Bavaria, and launched in a lake six leagues in length.

BUCEPHALA, in Entomology, a species of Bombyx, the anterior wings of which are cinereous, with two ferruginous streaks, and a large yellow terminal spot at the tip.

Gmel. &c.; called in English the boot-tip moth. Feeds on the lime, oak, willow, &c.

BUCEPHALA, or Bucephalus, in Ancient Geography, a town of India, on the west side of the river Hyndpse, built by Alexander on the site of his camp before his engagement with Porus, and so called (as Arrian says) in honour of his horse Bucephalus, which was killed, as some lay, in that action, or who died, according to Arrian, of old age, being about 30 years old, and was buried on this spot. "Heysch" says.
BUG fays, that this horfe derived its name from being branded on the buttock with the head of an axe. As he had been long the companion of the toils and dangers of his master, he shared extraordinary tokens of regard. When he was lost for a time in the country of the Uxii, Alexander liffed a proclamation, commanding his horfe to be restored, and threatening to ravage the whole country with fire and fword. The command was infantly obeyed. "So dear," fays Arrian, "was this horfe to Alexander, and fo terrible was Alexander to the Barbarians." Arrian. De Expd. Alex. lib. v. p. 219. 220. ed. Gronovii.

BUCHEPHA, a name given to a small town on one of the Iflands of the Greek Archipelago, now called "La Cava," which Alexander caufed to be built there in honour of his horse Bucephalus.

BUCHEPHALUS, in Ornithology, the name of a species of ANAS that inhabits North America. In the Arctic Zoology it is called the buffle headed duck. This kind is of a whitifh colour, with the back and wings black: the head large or tumid, guilty, and thinning.

Bufton calls this le petit canard à groffe tête. The bill is short, and either blue or brown: head black, glossed with green, or purple: collar and upper part of the breast white; lower part, with the abdomen, clouded brownifh: area of the wings white: tail cinereous: legs fulvous.

BUCHEPHALON, in Botany. Plum. See Trichos. BUCHEPHALUS, in Entomology, a species of Cryptocephalus of a cafonal colour, having the mouth, margin of the thorax, and the legs red. Fabr. Called by Schaller, Chryfomela bucephala.

BUCER, Martin, in Biography, an eminent German reformer, was born in 1491 at Schelestadt, in the province of Albia. At the age of seven years he entered into the order of the Dominicans; and having studied logic and philofophy at Heidelberg, he afterwards applied himself to divinity, and became a proficient in the Greek and Hebrew languages. At Heidelberg he held some conferences with Luther in 1521, and having previously perused fome of his writings, and alfo those of Erasmus, he was profefed to the profefient party. Of his conversion he gave evidence by marrying; and his wife was a converted nun, by whom he had 13 children. He settled at Strauburg, and ofliciated there both as minifter and theological profefor for 20 years; and to his labours the progres of the reformation in that city was much indebted. His talents and reputation caufed him to be employed in many conferences and negotiations; and in 1538 he was sent for to Augburg to fign the agreement between the papifs and profeflants, called the "Interim;" but his opposition to that project involved him in a variety of troubles. At this time he was invited to England by archbishop Cranmer, and appointed a profefor of theology in the university of Cambridge. King Edward VI. for whose use he compofed a book, entitled "Concerning the Kingdom of Chrift," manifefted great regard for him; and when he complained of the cold of this climate, prefented him with 100 crowns towards purchasing a German flame. He died of a complication of diforders in 1551, and was interred at Cambridge with diffinguifhed funeral honours. In the bigoted reign of queen Mary, his body was dug up and burnt, and his tomb demolished; but it was fet up again by order of queen Elizabeth. His erudition was various and extensive; of which he furnifhed ample evidence by his numerous writings, and by his learned lectures. His fyle, however, was obture, nor was it always easy to comprehend his meaning. He was moderate in his temper, and particularly licentious for preferring unity among the foreign churches. On occafion of the difcrences that took place between Luther and Zuinglius, and their respective followers, he inclined to the sentiments of the latter; but by his endeavours to reconcile them, he incurred reprofe from the zealots of both parties. His zeal for maintaining peace and concord betrayed him into an ambiguity of languages, and conciliatory artifices, which gave offence both to his friends and enemies. He fefons to have been inclined to allow the merit of good works, nor was he adverse to epifcopacy; and on both these accounts he was regarded with fome degree of fufpicion by Calvin and his followers. He was much oppofed by the papifh party at Cambridge; and as he did not profefs the talents of an acute and ready difputant, Peter Martyr advised him to avoid all public difputes. Gen. Dict. Mohlheim's Eccl. Hift. vol. iv.

BUCERAS. Haller. See Trigonella Fumum Grassum. BUCEROS, in Ornithology, the name of a genus in the order Pica, called in English hornbill. Birds of this kind have the bill convex, curved, sharp at the edge, of a large fize, and ferrated outwardly; a horne or fome what bony protuberance on the upper mandible, near the front of the head; noddles behind the base of the bill. Tongue acute and short. Feet grefiforial.

Of this genus there are twelve species, namely bicorius, abbyssinicus, africanus, malabaricus, hydorcorax, rhinoceros, galeatus, panayenis, mantinensis, nefitus, albus, and obscurus. Obs. the left is named plicatus by Latham, who also adds four new species to the bucus genus, giurginianis, orintalia, grifeus, and viridis.

BUCCHAN, William, in Biography, doctor in medicine, of a respectable family in Roxburghshire, was born at Aneram in the year 1729. Having paffed through the usual fchool education, he was fent to the university at Edinburgh. His inclination leading him to mathematics, he became fo considerate a proficient in that branch of science, as to be enabled to give private fefions to many of the pupils. Having made choice of medicine for his profeflion, he attended the lectures of the feveral profefors, neceffary to qualify him for practice; and as he continued in the university nine years, and was of a fubtile mind, his progres in knowledge may be fuppofed to have been equal to his application. He now removed to Sheffield in Yorkshire, where he commenced practitioner, in conjunction with another gentleman, whom he had invited him thither. Soon after he became a candidate, and succeeded in gaining the appointment of physician to the Foundling Hopital at Ackworth. From the opportunity he enjoyed here of feeing, and attending to the difeafes of children, he was probably induced to give for his inaugural theses, on his taking the degree of doctor in medicine, "De infantum vita conservanda." It was then much approved, and the fubfance of it now forms a fection in his "Domestic Medicine." He is fad from the regulations introduced by him for the management of the children in the hopital, to have considerably reduced the proportionate number of deaths of the children supported by that institution. This, however, did not prevent government from withdrawing their support to the hopital, which was in confequence given up, and the doctor, with his wife and fon, removed to Edinburgh, and continued to practice medicine there for feveral years, during which he employed his leisure hours in compofing his "Domestic Medicine," a work too well known to need being particularly decribed. It is written on the plan of Tiffot's "Avis aux Peuples," to which it is certainly not inferior. It has been faid, that by familiarizing the method of treating difeafes, as it is attempted to be done by works of this kind, the medical.
medical profession would be degraded, and the professors of the art would lose a portion of their respectability, and of their profits: but experience has shown that none of these events have followed; neither have we much reason for believing that the public are better judges of the merit of their medical advisers since the appearance of this popular work, which is one of the advantages we were taught to expect from it. If it has been profitable to any considerable degree, it may seem rather to have operated as a prophylactic, teaching the method of preventing diseases by regimen, than the art of discriminating them, or the mode of curing them when present. However that may be, since the year 1771, when the "Domestic Medicine" was first published, it has passed through nineteen editions, each of them, we are told, of 5000, or more copies. It has also been translated into all the modern languages, and procured for the author a gold medal, and a commendatory letter, more valuable than the medal, from the empress of Russia. On the death of the late Dr. Gregory, Dr. Buchanan offered himself as a candidate for the late professorship, but did not succeed. Mr. Ferguson, teacher of natural philosophy, dying soon after, he left the doctor his apparatus, with which, in conjunction with his son, he gave lectures at Edinburgh twice each season, for three years. In the mean while his fame being extended by the issue of his book, he was induced to come to London about the year 1778. He had now an opportunity of superintending the reprinting of his "Domestic Medicine," to which from time to time he made such alterations and additions as increasing experience had enabled him to collect, which entitled him to further remuneration from the bookellers. In 1786 he published "Cautions concerning Cold Bathing, and drinking Mineral Waters," 8vo. This was followed in 1796 by "Observations concerning the Prevention and Cure of the Venereal Disease." The next year he published "Observations concerning the Diet of the Common People." This has been incorporated with his Domestic Medicine. His last work published in 1803, is on "the offices and duties of a mother." He died on the 25th of February, 1803, of a dropsy in the chest, at the house of his son, in Percy street, and was buried in the churchyard of the west side of Westminster Abbey.

Buchan, in Geography, a district or territory on the east coast of Scotland, lying partly in the county of Aberdeen, and partly in that of Banff. The latter part extends northwards from the Ugie to the sea, and westward as far as Deveron, comprehending a tract of twenty miles in length by nine in breadth. The surface is mostly barren, though some parts of it are well cultivated. The coast is bold and rocky, and in some places presents almost perpendicular precipices. This district formerly belonged to the earl of Buchan; but upon the attainder of that family in 1320, Robert Bruce divided the lands among his friends; and though the title has been renewed in the present family of the Erkines, the present earl of Buchan poises but little property in the district. See Sir John Sinclair's Statistical Account of Scotland.

BUCHANAN, GEORGE, in Biography, a famous poet and historian, eminently distinguished among modern writers by the purity and elegance of his Latin style, was the descendant of an ancient family reduced to indigence, and born in the shire of Dumfriesshire, in Scotland, in 1506. The talents which he manifested in early life induced an uncle to send him to Paris for his education; but after pursuing his studies with singular industry, he definitely retired to Paris for his education; but after pursuing his studies with singular industry, for nearly two years, the death of his uncle and his own ill state of health obliged him to return home. Urged, perhaps, more by his necessities than by inclination, he enlisted as a common soldier in the body of French auxiliaries brought over to Scotland with John duke of Albany; but soon disgusted with their mode of life, he attended the lectures on logic delivered at St. Andrew's by John Major, and accompanied him to Paris. After struggling about two years with indigence and misfortune, he was appointed, in 1526, grammatical professor in the college of St. Barbé; and having remained in this situation three years, he obtained the patronage of Gilbert Kennedy, earl of Caffins, and was introduced into his family as private tutor and domestic companion. In this situation he continued five years; and availing himself of the intervals of leisure which he enjoyed, he translated Linsacre's rudiments of grammar into Latin, which was printed at Paris by Robert Stephens, in 1536. Two years after his return to Scotland his noble patron died; and he was appointed by king James V. preceptor to his natural son James, afterwards the famous regent, earl of Murray. About this time he incurred the reprobation of the Franciscan friars by a satirical poem, entitled "Somnium," but the clamour of these monks served only to increase his prejudice against them, and to strengthen his inclinations towards Lutheranism. As soon as the king discovered, in 1538, that they were forming a conspiracy against himself, he commanded Buchanan to write a poem against them. His first performance was less poetical than the king wished it to have been; and he was commanded a second time to write with greater severity. Accordingly he published his "Franciscanus;" written more in the style of Juvenal than of Horace, and abounding so much with invective and ridicule, that these monks became his irreconcilable enemies, and excited the general indignation of the clergy against him. The king himself was induced to withdraw his protection; so that Buchanan was tried for hereby, and in 1539 committed to prison. However, he soon found an opportunity of making his escape, and fled, first to England, and afterwards to France. But at Paris he dreaded the influence of his avowed enemy, cardinal Beaton, who happened to be then in the city, and he withdrew to Bourdeaux, whether he was invited by Andrew Goveanus, a learned Portuguese, who was principal of a new college in that city. Here he taught for three years in the public schools; and he also composed two tragedies, viz. "Baptistes, five Calumnia," said to have been translated by Milton, and published in 1641, and "Jephthes, five Votums," and translated the "Medea," and "Alcestis" of Euripides. During his residence at Bourdeaux the emperor Charles V. passed through the city, and was presented by Buchanan with an elegant Latin poem, which gave him great satisfaction. Cardinal Beaton made several attempts to render his situation uneasy to him, but they were counteracted by the interposition of his friends. However, in 1543, he left Bourdeaux on account of the pelléce, and for some time took part in the education of Michael de Montaigne, the celebrated author of the "Éffays." In the following year he went to Paris, and joined Turnebus and Muretus in conducting the education of the students in the college of Bourdon. In 1547, he accompanied Goveanus to the newly founded university at Coimbra; but the death of his friend, after a happy union of one year, subjected him to the enmity of the bigotted natives, who accused him of hereby, and confined him for a year and a half in the prison of the Inquisition, from whence he was afterwards removed to a monastery. In this situation he began his translation of "David's Psalms" into Latin verse, a work which has contributed in a high degree to his reputation as a poet. His translation of the 104th psalm has been particularly admired. In 1551, he was released, and the king, defirous of retaining him
him in the country, granted him a small pension. But having no strong inducements to prolong his stay in this country, he embarked for England; where, notwithstanding some advantageous offers were made to him, public affairs were in an unsettled state; and he thought it most advisable to remove to France, in 1553. Although he seems to have been fond of this country, he deplores in some of his elegies the miserable condition of those who were employed in the department of instruction at Paris. In 1555, he was entrusted by Marshal de Brifac, who then commanded in Piedmont, with the education of his son; and having continued in this station for five years, he devoted his intervals of leisure to the study of the sacred writings, and also to some poetical compositions, viz. his "Ode" upon the capture of Calais by the duke of Guise, his "Epithalamium," on the marriage of Mary queen of Scots to the dauphin of France, and part of his poem on the "Sphere." In 1560, he returned to Scotland, and avowed his conversion to Protestantism, which was then the established religion of the country. He was soon after appointed principal of St. Leonard's college in the university of St. Andrew's; where he also for some time taught philosophy; and at this period he made a collection of his Latin poems. Such was the respect entertained for his uncommon abilities and learning, that, in 1567, he was appointed, though a layman, moderator of the general assembly of the church of Scotland. When his former pupil, the earl of Murray, came into power, he formed an intimate connection with him and with the party, that was adverse to queen Mary. He accompanied this nobleman to York, and to Hampton court, where he acted as an advocate to the commissioners that were deputed from Scotland to conduct the accusations against the queen. Previous to this period he had been appointed by an assembly of the Scots nobility preceptor to the young king James VI. It was under his tuition, which continued for several years, that James acquired that scholastic knowledge, on which he so much prided himself; and it is said, that when Buchanan was afterwards reproached with having made his majesty a pedant, he replied, "that it was the best he could make of him." It is moreover reported, that Buchanan's reverence for his royal pupil did not prevent his giving him a severe whipping, when he perfided against reformation in disturbing him whilst he was reading. In 1571, Buchanan published his "Decticio Mariz Regine," arraigning the character and conduct of queen Mary, and expressly charging her with being concerned in the murder of her husband, lord Darnley; and of all our historians he alone avowedly accuses the queen of a criminal passion for David Rizzio. On this subject it will be sufficient to observe in this place, that admitting, with the most respectable and impartial judges, the general guilt of Mary, Buchanan divulges the question and forces the charge alleged against her with the vehemence and acrimony of a partisan. Such was the high estimation in which Buchanan was held, that after the assassination of his patron, the earl of Murray, in 1579, he continued in favour with those who possessed power in the country, and was appointed one of the lords of the council, and lord privy seal. He had also a pension of 100L a year settled on him by queen Elizabeth; which can hardly be considered as an adequate recompense for the services rendered by him, or suitable to the high offices which he fulfilled, and of which his tenure was precarious and of no long continuance. In 1579, he published his famous treatise "De Jure Regni apud Scotos," written in the form of a dialogue, and containing an explicit avowal of the right of subjects to decide upon and control the conduct of their rulers. This work, as we may naturally imagine, was highly extolled by some, and as violently cenüred and condemned by others. The author, however, ventured to dedicate it to his royal pupil, although the doctrine it contains was not very conformable to his views and inclinations. Whatever may be thought by contending parties of the principles which Buchanan has advanced in this publication, the avowal of them precludes the suspicion of his having been actuated by mercenary motives. During the last twelve or thirteen years of his life he was employed in composing his history of Scotland; and for the sake of obtaining greater leisure he retired from court and passed some of his last years at Stirling. This work, entitled "Rerum Scotiaearum Historia," and comprised in 20 books, was published at Edinburgh in 1582, not long before his death, which happened on the 5th of December in the same year. Towards the close of his life, his circumstances were much reduced; and it is said, that when he was dying, he ordered the small sum of money that remained, and which was insufficient for defraying the expenses of his funeral, to be given to the poor, expressing at the same time great indigence about the fate of his corpse. Accordingly, he was buried at the expense of the city of Edinburgh. The manner of his death has given occasion to his enemies for calumniating him as a libertin and an atheist; but for charges of this kind, chiefly added by bigotted Catholics, there is no just foundation. Sir James Melvil, differing with him in his political sentiments and connections, has nevertheless done him the justice to declare, that he died a sincere member of the reformed church. Against his moral character, it has been alleged, that he reduced himself by extravagance and debauchery to penury and indigence, at the close of his life; but to this charge it has been replied, that his intention to pecuniary matters, and the profusion of his charity, might account for his indigence, without ascribing it to culpable prodigality. His advocates, however, allow, that when he possessed wealth, he was, to an extreme degree, careless of the future, and that he made no provision for the season of dotage and helplessness. It has been further urged against him, that several of his poems indicate indiscretion and licentiousness; but his advocates have fought an apology for him from the age in which he lived, the taste of which was in this respect very different from that of a later period. The ancient satirist, says Mr. Hume, often used great liberties in their expressions; but their freedom no more resembles the licentiousness of Rochester, than the nakedness of an Indian does that of a common prostitute. With regard to his temper, Buchanan seems to have been lavish and unamiable; and, as a party-man, virulent and little inclined to indulge feruples. The persecutions of priests, and the oppression of misfortune, served to augment the natural fretfulness and asperity of his disposition, and gave an edge to his spleen. However, in his conduct he frequently exhibits a noble independence; and with respect to the public principles which he adopted, there is no reason to suspect in his avowal of them want of integrity; however he might have been influenced in some degree by partiality to his party, or deceived by the reports of others. The learned John Le Clerc has very ably shown (Bibliotheque Choix), that there is much reason to conclude, that many of the severe cenures which have been thrown out against Buchanan, were the result of ignorance, of prejudice, and of party animosity. Sir John Melvil, who was of the opposite party, allows, that as far as he was concerned in public affairs, he distinguished himself by his probity, and by his moderation. But whatever different opinions may have been entertained by persons of opposite parties concerning his disposition and moral character, all concur in applaud-
appraising him as a writer. "His poetical character," says a very competent judge, "ranks extremely high; yet his merit does not yield to such in splendour, sublimity, and beauty of the imagination, as in splendour of diction, and harmony and variety of verification."

It is supposed to derive its name from the city of Bukhara (which see) near the Jihon or ancient Oxus, which was the emperior of the commerce carried on by the Europeans in that quarter; and afterwards extended to the adjoining country, beyond it. Bukhur, or Bukhar, as Abulbazi Khan informs us, was a Mungl or Mogul word, importing a "learned man," and as all those who formerly wished to be instructed in the languages and sciences went, for that purpose, into Bukhara, the name was originally given to it by the Moguls, who conquered this country in the time of Genghis Khan. This extensive region is divided into two parts, called Great and Little Bukharia, corresponding to the southern divisions of the two ancient Scythias, which were separated by the ridge of mountains denominated the "Imans," and called by Shereefedin the "Karangoutac" mountains.

Bucharia, Great, is that extensive and important region of Independent Tartary, which comprehends part of the Touran or Turan of the ancient Persians, and was chiefly known to the Greeks and Romans by the names of Sogdiana and Bactriana; the former being the Arab "Maweralmah," or country beyond the river, i.e. the Jihon or Oxus, and corresponding to "Transoxana," the name anciently given to those provinces which lay beyond this river; while Bactriana corresponds with Balk, and accordingly belongs to Iran, and not to Touran. Major Remin cautions us against confounding, as some geographers have done, the modern Bucharia with the ancient Bactria. Bucharia, he says, is situated beyond the Oxus or Jihon, and is the country anciently named "Sogdiana," from "Sogd" the valley, a beautiful valley in which Samarcand (anciently Maracanda) is situated: whereas Bactria or Bactriana lay on the south of the Oxus, and comprehended the present provinces of Balk and Gaur, and probably part of Koraian.

Great Bucharia extends more than 700 British miles in length from north to south, by a mediaw breadth, if Fergana be included, of about 350; thus rather exceeding Great Britain in size, but much inferior to the country named Little Bucharia. On the north it is bounded by the mountains of Argun and Kara Tag; on the west by a defert, the river Amu, and other deferts, which divide it from Khurman and Khorasan; and on the south, if it be extended fo as to include Balk, by the mountains of Gaur or Paspamifus, and the Hindoo Koh; and on the east by the chain of Belur. According to these boundaries, it is situated between about 35° and 42° N. lat. and between about 60° and 70° E. long. The original population of this country was Scythian; and the natives are still denominated by the same Tartaric name of "Tadjiks," which the barbarous victors affigned to the Persians. The Persian monarchs were often engaged in wars with those of Touran, or the Scythians on this side and beyond the Imans, whose queen, Thomyris, is said to have slain Cyrus in battle. After the progres of Alexander as far as Cogend on the river Sihon (or ancient Jaxartes), this country became better known, being probably the utmost limit of his course towards the north. When Genghis Khan died, A. D. 1227, he bequeathed Great Bucharia to his second son Jagatay Khan, and it took the name of Jaghatay or Zagatay in honour of its new proprietor; which name it retained as long as the Khans descended from him reigned in these parts. But in 1408, Sultan Babur, a descendant of Timur, was expelled with his Mongols from Great Bucharia; and the Tartarian victors, called Ulbucks, established a powerful monarchy in the country. Successive Khans held the sceptre from 1458 to 1658; and soon after this period the
the extensive and fertile country of Bucharia seems to have been divided into several governments, under numerous Khans. All the great towns, both of Great and Little Bucharia, from the borders of Kharafan as far as China, are inhabited by the Bukhars, or descendants of the ancient pothis, called by the Tartars, Tadjiks. These are well made and very fair, allowance being made for the climate; they have generally large, black, and lively eyes; their countenances are open, their noses aquiline, their hair black, and their beards bushy. The women are generally tall, and well-shaped, with fine complexions, and very beautiful features. Both men and women wear calico flirts and drawers; over which the men wear a veil of quilted silk, or calico, reaching to the mid-leg, and tied about the middle with a silk-cape girdle or sash. In winter they are covered with a long cloth gown, faced and lined with fur. The head is covered with a round cloth bonnet, having a large fur border; and some wear turbans. Their boots resemble the Persian buskins, and they polish a singular art of preparing horse-hides for this use. The women wear long gowns that are full and loose; their hair hangs in tresses, and is adorned with pearls and other jewels. Their bonnets are small, flat, and coloured. The Bucharians are a commercial people; and their caravans travel through the whole continent of Asia, and traffic with Russia, Thibet, China, India, and Persia. Russia contains several colonies of Bucharians, who are settled in many large towns of the southern provinces, and maintain a constant communication with the merchants of their own country. Their principal marts are Tomik, Kindea, and Orenburg, which is the most considerable. Their caravans are exposed to pillage by the Kirguf Tartars, through whole country they are obliged to pass. Their exports are gold and silver, chiefly in Persian coins and Indian rubies, gold-dust found in the sand of the rivers of Bucharia, precious stones, particularly rubies, lapis lazuli, spun and raw cotton, cotton Fluxes in great abundance, both Indian and Bucharian, half-silk, unpreparted lute, native sal-ammoniac, lamb-skins, raw silk in small quantities, rhubarb, and large droves of sheep and horses, which are bought for sale by the Kirgufute Tartars. Pallas says, that above 60,000 sheep and 10,000 horses are yearly sold at Orenburg. The Bucharians receive in return cloth, leather, beads, and trinkets, hardware, indigo, cochineal, &c. The Bucharians never bear arms; but on this account they are despised by the Tartars, as a cowardly and weak people. The Jagatay Tartars, who are the descendants of the Tartars who first possessed this region, are now comformed under the general name of Usbecks. The Usbecks are commonly reputed the most civilized of all the Mohammedan Tartars, although, like the rest, they are great robbers. Both men and women are clothed, like the Persians, as low as their boots; and the chiefs wear plumes of white hoar feathers on their turbans. Their most delicious dishes consist of "pillow," which is rice dressed in broth, and horeh-flesh. Their common drink is kumufs and arak, both made of mare's milk. Their language is a mixture of the Turkish, Persian, and Mongolian tongues. Their arms consist of the sabre, darte, lance, and bow, of a larger size than ordinary, which they manage with much strength and dexterity. For some time past they have used muskets. When they go to war, many of their cavalry wear coats of mail, and a little buckler for defence. They value themselves on being the most robust and valiant of all the Tartars; and even their women, who surpass the other Tartars in beauty, are not averse from warfare, but will sometimes attend their husbands to the field. Although many of these inhabitants of Bucharia reside in huts in the summer; yet in winter they inhabit the towns and villages. The religion of the Usbecks and Bucharians is the Mahometan of the Sunni sect; and the government of the Khans is despotic. The amount of their population is not precisely ascertained; but it is probable that upon an emergency an army of 100,000 men might be mustered. We have no accurate statement of the revenue of these fertile provinces; but it is not improbable that the revenue of Great Bucharia is at least equal to that of Kharafan, which, by Mr. Hanway's account, is equal to half a million sterling annually. The climate in general appears to be excellent; the heat even of the southern provinces being tempered by the high mountains capped with perpetual snow; and the proximity of the Siberian deserts and the lofty Alps, renders the air much more temperate than that of other countries, such as Spain, Greece, and Atlantic Turkey in the same parallel. The face of the country presents a great variety; but though there are numerous rivers, hills, and mountains, there seems to be a deficiency of wood. Near the rivers the soil is productive, so that the grain sometimes exceeds a man's height; and in some parts considerable industry is shewn in the cultivation of rice and other grain. In the lands of any other persons belonging to these of the Tartars, this country might rival any European region. There is not a more flourishing or more delightful country, says a famous Arabian geographer, than this, especially the district of Bokhara. From the ancient caille of this city a scene of luxuriant and beautiful verdure presents itself on every side of the country; so that the spectator would imagine the green of the earth and the azure of the heavens were united; and as there are green fields in every quarter, so there are villas interspersed among the green fields. In all Kharafan and Mavara, there are not many people more long-lived than those of Bokhara. The rivers and lakes of this country are numerous and considerable in size; and its mountains are lofty and extensive. For the principal rivers, see Ando, Sodg, Morgan, Kisile-Daria, Dehsh, &c.; and for the principal range of mountains, see Belur.

The cities in Great Bucharia generally give name to the provinces, or receive their appellation from them. In the north is the province of Fergana, the capital of which is Andegun. The other chief provinces are the western part of Shahi, and a district called by M. d'Anville Osfoutine, from a town of the same name, and by Ebn Haukal, Secruni. The most fertile province is Sodg; and next to this are Vah, Kotlan, and Khan. The Alpine region that separates this country from Little Bucharia, is Belur; and the most southern provinces are Tokarefann and Gaur. The chief city of Great Bucharia is Samarcand, and vying with this for dignity is Bokhara. See each of these articles respectively, Seculo, Park, Zoro, Bokarsham, Terval, &c.

Bucharia, Little, is so called, not because it is more limited in extent than Great Bucharia, being in reality much larger; but because it is inferior to it as to the number and importance of its cities, the quality of its soil, and the amount of its population. This country corresponds to the "Scythia extra Imaum" of the ancients, and to the "Serica" of Ptolemy. The Scythians beyond the Imaus are described by this geographer as retir'd to a confined strip of territory on the eastern side of the Imaus, and divided by an imaginary line from the Seres, who were undoubtedly the people of Little Bucharia. But as ancient knowledge here terminated, it is probable that the Scythians beyond the Imaus not only held the eastern ridges of these mountains, as a barbarous race continues to do without moulding the industry of the dilute plains, but that they were diffus'd along the ridge of 3 M 2 Alak,
Alak, and the wide region called Gete, extending as far as the mountains of Bogdo, till they were expelled or subdued by more numerous or powerful nations from the cast. But as it is now allowed by all geographers that the range called Belar Tag represents the Imaus, and that this range runs from north to south, forming the eastern boundary of Great Bucharas, it will be evident from Ptolemy's description and maps that "Serica" can be no other country but Little Bucharas, always polli
ded by an intelligent and industrious race of men; not only the ridge of Imaus, but the remarkable course of two considerable rivers towards the north-east, while all his other Atlan
cic streams have very different directions, sufficiently indicate Little Bucharas, in which the rivers correspond with Ptolemy's delineation; the Oechardes being probably the Orankaf of modern maps, or perhaps the river of Yarcand; while his Bautitis may be the river of Koten, or that of Karia. The know-
ledge of Ptolemy does not appear to have extended easterward further than 80° from Greenwich; and, therefore, few compari
ons can be instituted between the modern names and situations and those of Ptolemy. M. D'Anville supposes that the mountains of Annabi are those of Altaï; whereas they are those of Alak, called by some Mutafar, on the north of Little Bucharas. The mountains on the south correpond with those of Mus Tag, or the mountains of Ice on the north of Thibet. To the south also lies the sandy desert of Cobi, of unascertain'd extent, but suppos'd by some to reach westward as far as the northern snowy mountains of Thibet already mentioned. The southern part of Little Bucharas contains several large provinces, as Koten and Karia or Kereja, so called from their capital cities; and the intelligent Strahlenberg has denominated Koten a kingdom, and has inflected several names of rivers and towns. On the east Little Bucharas is bounded by deserts and provinces of Mongolia, and particularly by the province of Hami or Chamiel belonging to China. The western and northern parts of this country are more accur
ately known by means of various accounts, and by the maps of D'Anville and Iflinieff. To the north is the Alak mountain, and beyond it Soongaria, and in the west the Belar Tag, which separates it from Great Bucharas. In Rennell's map, however, the western boundary is that ridge of the ancient Imaus, denominated by Sirefeddin the Karangoutac mountains, and between this and the Belar ridge is Baltit or Little Thibet. The chief rivers of Little Bucharas are the Bulanghir, probably the Polonik of the Jefuitic maps, flowing into the lake Locknor, the Chaidu and Yareca Darja sluing from it, and supplying several branches as the Koten, Oraksha, &c., and the Kereja proceeding from a lake in the defect of Sultus. The principal towns are Cafghar, Yarcand, Alku, Chialif, Turfan, Koten, and Karia, which ice respectively. Independently of the regions to the north, the extent of Little Bucharas, from the confines of Hami to the mountains of Belur, is more than 1000 British miles; and the breadth, from the mountains of Thibet to those of Alak, more than 500. It is of course comprehended between 36° and 43° N. lat., and about 72° and 83° E. long. As the land is much elevated and abounding in mountains, the climate is cold; and, in contradiction to the usual course of nature, the southern part bordering on the Alps of Thibet is colder than the northern, which is protected by the lower ridge of Alak. Among its hills are several fertile plains; but the population is not extensive. Between the cities in this country there are no villages; and in travelling a whole day from one to another, there is not a house of entertainment to be found. From Du Halde's atlas it may be deduced that the Contaish, or Great Khan, could raise 20,000 men from this province, taking one man from 10 families; and hence the number of families would be 200,000, which would yield a population of one million. The in
habitants, who are for the most part descendants of Bu
charians, with a great mixture of Tartars or Turchomans, and a few Kalmuks, are generally swarthy and black-haired, although some of them are very fair, handsome, and well made. They are said to be polite and benevolent; and their language is probably that called the Zagathan or Turkifh, which has supplanted their native tongue. The drefs of the men resembles that of the Tartars, reaching no lower than the calf of the leg, and bound with girdles like those of the Poles. The garments of the females are of the same kind, commonly quilted with cotton; and they wear long ear-rings, twist their hair in tresses, lengthened by decorated ribbands and tussels of silk and silver, so as to hang down to their heels. Their necklaces are ornamented with pearls, small pieces of coin, and several gilded or silvered baubles. Some of them tinge their nails with henna. Perfumes of both sexes wear trowsers, with light boots of Ruffia leather, and occasionally high-heeled slippers. The head-
dress resembles that of the Turks. Married women are
distinguifhed from those that are single by a long piece of linen worn under their bonnets, which is folded round the neck and tied in a knot behind, so that one end of it hangs down to the waist. Both sexes carry about them prayers written by their priests, and kept in a small purse, under the form of relics. Their houses are commonly of stone, well built, and decorated with some articles of china. When they go to sleep, they throw off every garment; they are cleanly in the preparation and use of their food, which is usually minced-meat, and their general drink is tea, which they prepare with milk, salt, and butter. At their meals they use neither chairs nor tables, knives nor forks, but fit croffed-legged on the ground, and when the meat is served up ready cut, they take it up with their fingers or wooden ladles. Their wives are purchased, so that a perfon who has many daughters is accounted rich. The ceremonies of marriage differ little from those of other Mahometans, and polygamy, though regarded among the Bucharans as a kind of fin, is generally practiced. Their children are named on the third day after birth, and circumscribed on the 7th, 8th, or 9th day. In sickness the mullah or priest has great influence; and when a perfon dies, he lays a koran on his breath, and recites some prayers, after which the body is interred in some pleafant wood and inclofed with a hedge or pallifade. Their money con
fists of copper kopeks, weighing nearly one-third of an ounce; and in pfaffing silver or gold, they weigh it, like the Chinefe. The prevailing religion is the Mahometan; and the Kal
mucks or Eluths allow unlimited toleration. The govern
ment, before the Chinefe took possession of the country, was fift of all administered by a Khan, and afterwards by the contaish of the Kalmuks, who appointed inferior mag
istrates. The foil of Bucharas is in many parts of it fertile and productive, and yields various kinds of fruits, and particularly wine. It is also rich in mines of gold and silver, but neither the natives nor Kalmuks are sufficiently skilful to work them; and out of the torrents, which flow from the mountains when the snow melts, they collect gold-duff, which they carry to India, China, and Siberia. Precious fiones and diamonds are also found in this country, and the southern mountains near Thibet furnish mafs. As the drefs is chiefly cotton, the plantprobably abounds in this coun
try; though from their proximity to China the Seres might easily have transmitted flk to ancient Europe. Pallas speaking
speaking of Bucharia, but probably meaning Great Bucharia, mentions raw silk as a product of the country, very fine lamb-skins, the hair of camels, and an excellent rhubarb, which latter article grows in the south-east part of Little Bucharia.

In more ancient times, Little Bucharia, as we have already observed, was the country of the Seres; but it seems to have been but little known before the time of Genghis Khan, upon whose death this country, as well as Great Bucharia, became the portion of his son Jagatay, or Zagathai, and was occasionally called by his name, but more generally known by the appellation of Cashgar. It was then considered as a part of Mogolistan, or Mongolia; and the northern provinces belonged to the country of Gete. It had a succession of Khans, separate from Great Bucharia, till about the beginning of the 14th century. From that time it seems to have been governed by a succession of the descendants of Timur, till the year 1083, when it was subdued by the Eluths, or Kalmuks. To them it remained subject, till at a recent period it was conquered by the Chinese. In 1759, Kiang Long, or Chin Lung, completely vanquished these people; and thus annexed an extensive territory to his dominions.

BUCHAU, a free imperial town of Germany, in the circle of Swabia, seated on the Feder lake; 24 miles S.W. of Ulm. N. lat. 48° 6'. E. long. 9° 37'.

BUCHAU, a small country of Germany, in the circle of the Upper Rhine, comprehending the estate of the abbey of Fulda, of which Fulda is the capital.

BUCHEN, a small town of Germany, in the circle of the Lower Rhine, and electorate of Mentz; 22 miles E. of Heidelberg.

BUCHENBERG, a town of Germany, in the circle of Swabia, and territory of the abbey of Kempten; 5 miles W.S.W. of Kempten.

BUCHERI, a town of Italy, in the valley of Noto; 3 miles N.E. of Monte-Rosso.

BUCHHOLZ, a small town of Germany, in the circle of Upper Saxony, and Middle Mark of Brandenburg; 23 miles S.S.E. of Berlin.—Also, a small mine-town of Germany, in the circle of Erzgebirg, having a seat and voice at the Land-diets. At this place considerable quantities of lace are made.

BUCHIGLIERA, a town of Naples, in the province of Calabria, Castor; 11 miles W.N.W. of Umbriciato.

BUCHLOE, or BUCHLAKE, a town of Germany, in the circle of Swabia, and bishopric of Augsburg; 18 miles S.S.W. of Augsburg.

BUCHNER, ANDREW ELIAS, in Biography, physician and aulic counsellor to the king of Prussia, and professor of medicine, first at Erfurt, and afterwards at Hall in Saxony, published, in 1755, in 4to; "Historia Academica naturae curiosorum," of which he was several years president; "Fundamenta materie medica, simplicium historiae, vires et preparata exhibentia," Hall, 1754, 8vo; "Syllabus materie medica felicissimi, cum designatione ponderis, &c." Hall, 1755, 8vo. He was also author of several ingenious disquisitions published in the Miscell. Nat. Curios. and of a number of disquisitions, or inaugural theses, on botanical subjects. Among these, he particularly notices the "Dipintatio de genuinis viribus Tabaci, ex ejus principiis connotativis demonstratis; et de genuinis Opii effectibus in Corpore Humano;" each of them containing several ingenious experiments made on animals, with the view of ascertaining the properties of those drugs; also a method of instructing deaf persons. He died in the year 1769. Hall. Bib. Bot.

BUCHNER, J. GOTTFRIED, of whom we have no biogra-
gradually enlarges into a large, flat header, with five rounded lobes. Off. The younger leaves, not having left the flower, are not certain of the genus, especially as it has some resemblance to the geranid. and, like them, become entirely black in drying. Native of South America. Mutis. 7. B. argyrophyta. Linn. Mont. "Leaves three-toothed; flowers peduncled; stem rather shrubby." Stem half a foot high, much of the leaves opposite, stalked, less toothed, flowers on each side near the top. Flowers toward the base of the branches, large, opposite; peduncles one flowered, longer than the leaves, on a Cal. monopodium, five-toothed, a little hispid. Corolla yellow, twice as long as the tube of the calyx. Capsule biocular, ovate-oblong, febrile longer than the calyx. S. B. viscosa. Hort. Kew. "Leaves linear lanceolate, dilantly toothed, a little glabrous; flowers peduncled; stem shrubby." Native of the Cape of Good Hope. Found by Maffon, and introduced into England 1754. B. tappafla. Linn. Mont. "Leaves toothed. Linear, alternate; calyx pustuliferous." Stem annual, about one inch high, straight, with four or five simple branches near the top. Leaves generally alternate. Flowers sessile, in short, terminal spikes. Calyx a little inflated. Coroll yellow; tube slender, slightly villos; two of the petals projecting a little beyond the throat of the corolla. Stem, branches, leaves and calyces clothed with a somewhat villos. La Marek, from a dried specimen. Allied to rhinanthus cyprias. Linn. Native of the Cape. 10. B. asiatica. Linn. Spic. Plant. "Leaves very entire, linear, calyx scabrous." Stem obtusely four-cornered; branches alternate, with the habit of an euphorbia. Leaves linear; upper ones alternate, lower opposite. Tube of the corolla filiform, including the petals; border two-segmented, one segment nearly upright and triad, the other open and heart-shaped. Val. (Sym. 5, p. 81.) describes the leaves as covered on the upper surface, and at the rib and margin of the lower, with numerous white scales, producing very small, solitary hairs; and the calyxes are solitary, nearly sessile, flattened; the skirts toothed with numerous minute, rigid hairs. La Marek has, in his herbarium, a plant resembling euphorbia Index Orientalis of Plunkenet, and which he presumes is buchnera asiatica. It is rough to the touch; and the calyx is a whitish, remembrance. Native of Ceylon and China. 11. B. euphorbiifolium. Willd. "Leaves linear, very entire, febrile with hairs; segments of the corolla linear, obtuse." Val. Refermiles euphorbia longiflora. Stem acutely four-cornered, branched; branches opposite, higher than the stem, profusely covered to the leaf, and almost imbricated. Leaves short, opposite and remote below, alternate and crowded above. Calyx febrile, axillary, about the length of the leaves. Tube of the corolla villous; segments linear. Val. Native of the East Indies. 12. B. geoffrionii. Willd. "Leaves oblong, dilated, prefixed close to the stem, squamiform; tube of the corolla curved." Stem half a foot high, branched at the base, at first light appearing naked. Leaves very minute. Flowers sessile, axillary, longer than the leaf, furnished on each side with a linear, obtuse bracteae, ciliated at the margin. Calyx five-cleft; segments lanceolate, ciliated. Corolla nearly at euphorbia longiflora; tube smooth; segments of the border oblong. Calyx oblong, obtuse, bilocular. Willdenow, from a dried specimen. Native of the East Indies. 13. B. pinata. Linn. Suppl. "Leaves linear, flat, smooth." Found at the cape of Good Hope by Thumberg. Off. La Marek is inclined to think that buchnera manilensis, and erinus, are properly only one genus. They differ from lekenanthera and felago in having a two-celled, polyporous capsule.

**BUCHNIAE brumifolia (Forskall). See Brownallia, where, on Forskal's authority, it is placed by La Marek, and said to have a one-celled capsule; but Val. on the other hand, ascribes to it a bilocular capsule with a portion opposite to the valves, very like that of buchnera brachyphylia, from which plant, he says, it differs only in its prostate stem and oblong leaves. It does not appear, that either La Marek or Wildenow had seen a specimen.**

**BUCHOLDZ, Peter Joseph, in Biography, a physician, who rose by his merit to the first rank, in eminence, in his profession, was born at Mutza, about the year 1756. After receiving a liberal classical education, in which he is said to have made a more than ordinary proficiency, he was sent to Pont-Mousson, and was admitted to the degree of doctor in medicine at the university there, in 1759. Being from distinguished for superior abilities and industry, he was in succession made physician at Stahl's, king of Poland, to the duke of Lorraine, & c. and teacher or demonstrator in botany to the Royal College of Physicians at Nancy. He was also associated as a foreign member to most of the medical and philosophical academies on the continent, to which he from time to time communicated his observations. His works are numerous, all on botanical subjects. The titles of a few of them follow: "Discours sur la Botanique," Paris, 1763. "Traité historique des Plantes qui croissent dans la Lorraine, et les trois échets," Nancy, 1758. From 1763 to 1759, 9 vols. The work was abruptly broken off incomplete. He was afflicted in forming it, by the papers and the Hortus Sicus of his father-in-law, Marquet, to which he made large additions. The first volume contains disquisitions on botany, with explications of the systems of Theophrastos and of Linnaeus; the second, purging; the third, pectoral; the fourth, inflammatory; the fifth, emmenagogue; the sixth, plants exciting perspiration. In each volume are engravings of the most remarkable plants in each class, with occasional experiments to ascertain their properties. "Medicine rurale et pratique," Paris, 1768, 12mo, containing useful information, and enabling the poor to select proper remedies for their complaints. "Secrets de la Nature et de l'Art pour les Alimens, la Medicine, la Veterinaire, avec un Tractat sur les Plantes qui peuvent servir a la Teinture, & c." Paris, 1769, 12mo. 4 vols. "Dictionnaire raisonné des Plantes et des Arbustes de France," Paris, 1770, 4 tomo. For the titles of the remainder of his works, see Haller. Bib. Botan.

**BUCHOLTZ, in Geography, a town of Germany, in the circle of Welfphalia, and county of Verden: 18 miles ENE. of Verden.**

**BUCHOREST. See Bucharest.**

**BUCHORN, an imperial town of Germany, in the circle of Swabia, seated on the north side of the lake of Constance. The inhabitants are Lutherans. Here are warehouses for goods destined to it for the passage of the lake. It is distant 13 miles from Constance, N. lat. 47° 41'. E. long. 9° 20'.**

**BUCHOV, a town of Hungary; 2 miles W. of Bobloa.**

**BUCHOW. See Buc.**

**BUCHWALD, Balthazar, John, in Biography, a German physician, published, in 1720, "Specimen Medicinae Practicae Botanici," 4to Hafniæ, containing the descriptions and accounts of the medical properties of many of the common plants, with dried specimens of the plants affixed to the leaves. De Diabeticis Curents, præsimus per Rharbarbarum, 4to 1737," also "Vifici Analytis, ejusque in diversis Morbibus Usus, 4to 1753." Haller. Bib. Botan.**
BUCHY, in Geography, a town of France, in the department of the Lower Seine, and chief place of a canton, in the district of Rouen, 47 leagues N.E. of it. The town contains 67,3 and the canton 9060 inhabitants; the territory comprehends 1624 square kilometres and 30 communes.

Gen. char. Cal. Perianth one-leaved, pitcher-shaped, obfoletely five-toothed, superior, permanent. Cor. none. Stam. filaments ten, capillary, longer than the calyx and inserted in its base. Author upright, heart-shaped. Pif. germ inferior, ovate; style the length of the flaments: stigma obtuse. Peric. berry dry, ovate, one celled, crowned with the calyx. Seed one, ovate.

Efflent. char. Cal. fine toothed, superior. Cor. berry one-seeded.

Spec. 1. B. Buciceras. Olive bark tree. Linn. Brown Jam. t. 23. f. 1. Sloane Jam. t. 189. f. 3. La Marek, pl. 356. "Spic. elongate; leaves wedge-shaped, smooth." Vahl. Stem. a tree, thirty feet high, about one in diameter. Branches dis- vicate, or flexuose, roundish, smooth, and even. Leaves only at the disvocations and summits of the branches, crowded together, petioled, obovate or ridge-shaped, obtuse, very entire, veined, smooth, near two inches long. Spikes, or rather spike-like racemes numerous, simple, peduncled, axillary near the ends of the branches, about the length of the leaves. Flowers small, yellowish, alternate, sessile, hoary, without tomento within. The style or upper part of the germ, especially at the extremity of the racem is sometimes extended to the length of an inch or more, and curved somewhat in the form of a bull's horn; whence Linnaeus and other authors have observed its affinity to rhizophora. Described by La Marek from a dried specimen. A native of the West-Indies and South America. In Jamaica it is called black olive; in Antigua, French oak; and in the French island, Guignon. Its bark is used for tanning leather; and its wood is excellent for coffers of drawers and other kinds of cabinet-makers' work, as it is seldom attacked by worms. 2. B. capitata. Willd. "Flowers with capitate spikes; leaves ridge-shaped, ciliated." Vahl.

BUCEO, in Geography, a town of Naples; 6 miles W.N.W. of Cagnano.

BUCEO, in Commerce, a sort of woolen cloth manufactured at Provence in France, which the French ships carry to Alexandria and Cairo.

BUCK, in Zoology, a male horned beast of venery or chase, whose female is denominated a doe. A buck the first year is called a fawn, the second a pisket, the third a forel, the fourth a fore, the fifth a buck of the first head, and the sixth a great buck. See Deer and Hunting.

Buck is also applied to the males of the hare and rabbit kind. Hares commonly go to buck in January, February, and March, and sometimes all the warm months; sometimes they seek the buck seven or eight miles from the place where they live. The buck rabbit is said to kill all the young hare he can come at; on which account the doe is careful to hide her offspring in some remote corner, out of his way. The doe coney goes to buck as soon as she has kindled. She cannotuck her young till she has been with the buck. When he has bucked, he usually falls backward, and lies as in a trance half dead, at which time he is called taken.
BUCKHAVEN, in Geography, a village on the coast of Fifeshire, in the parish of Wemyis, in Scotland. This place is wholly inhabited by persons engaged in the fisheries, as this part of the coast is much frequented by haddocks. About 50 years back these fish were caught here in such abundance, that they were sold at the rates of sixpence and ten-pence per hundred. The first inhabitants of this place are said to have been some Dutch fishermen, whose vessel was stranded here in the reign of Philip II. In the year 1791, the village contained 691 inhabitants. Sinclair's Statistical Account of Scotland.

BUCKLEY, a considerable fishing village in the parish of Rathven, county of Banff, Scotland. Here is a tolerable harbour, to which belong 6 flocks, 14 boats, and 1 yawl. It is situated at the mouth of a river of the same name, and contained, in 1791, 731 inhabitants. The property of the place belongs about equally to the duke of Gordon and the honourable baron Gordon. Sinclair's Statistical Account of Scotland.

BUCKING, among Miners. See Ore.

BUCKING, an operation performed on linen cloth, cotton, and yarn, to render them somewhat white, by working them with lime made of ashes. Bucking of cloth is the first step or degree of whitening it. See BLEACHING.

To drive a buck of yarn, they first cover the bottom of the bucking-tub with fine ashes of the ash-tree, then spread the yarn thereon, then cover it again with ashes, and thus stratum super stratum, till the yarn is all in; when they cover the whole with a bucking-cloth, and lay on it more ashes, and pour in warm water, till the tub be full, and let it stand all night. Next morning they let the yee run into another vessel, and as it waits, fill up the tub with warm water from a kettle, and, as this waffes, fill it up with the yee that runs from the bucking tub, still observing to make the yee hotter and hotter, till it boils. Thus are both the tub and kettle to be supplied for at least four hours, which is called driving a buck of yarn.

BUCKINGHAM, in Geography, the county town of Buckinghamshire, England, appears to be a place of considerable antiquity, and has been the scene of some particular historical events. According to bishop Kemest, it was at or near this town that the Roman general, Aulus Plautius, surprized and routed the Britons, under the command of Caractacus and Togodumnus, the sons of Cunobeline. In the early Saxon times, it became celebrated as the burial-place of the infant saint Rombald, who was born at King's Sutton in Northamptonshire, and is reported, by catholic fabulists, to have lived but three days, during which period he professed himself a Chrlitian, and wrought many miracles. According to the Saxon Chronicle, Edward the Elder resided here in the year 918, and built two forts to repel the incursions of the Danes. The town was ravaged by the Danes in 941, and again in 1010, when, having plundered the adjacent country, they retreated hither to secure their spoils. At the time of the Norman conquest, Buckingham was flated to be the only borough in the county; yet it was then but an inconsiderable place. In the reign of Edward II. its importance was increased by that monarch making it a mart for wool; but the trade being removed to Calais, it again declined; and in the 27th of Henry VIII. Buckingham was in the list of decayed cities and towns, which were relieved by act of parliament. The removal of the affizes to Aylesbury still left the confecution of Buckingham; and in 1724, a dreadful fire completed its misfortunes, when, out of 387 houses, 138 were consumed, besides outhouses and manufactories. The damage was estimated at 40,000L. Since that period the trade has in a small degree revived, part of the county busineses being restored, and the affizes fixed here by act of parliament in 1758, in which year a gaol was erected. The town-hall is a large brick building, surmounted by a gilt swan, the arms of the borough. But the most conspicuous and principal ornament of the town is the church, which stands on the summit of an artificial mount, which was anciently occupied by a caile. This lately fabric was begun in 1777, and completed in 4 years, at the expense of about 7000L.; the greater part of which was contributed by the late earl of Buckingham. The church is built of stone, and has a handsome square tower attached to its west end, ornamented with pinnacles, embasures, and a light tapering spire, which rises to the height of 150 feet from the ground. The interior is constructed on the same plan as Portland chapel in London. A large gallery, supported by Doric columns, projects from three of its sides. From the gallery rise twelve more columns of the Ionic order, sustaining a richly decorated ceiling. The corporation consists of a bailiff and twelve burgesses, in whom is vested the right of election for members of parliament. It does not appear that this town sent members previous to 36 Hen. VIII. through three persons were sent, as early as 11 Edward III. to a council of trade held by that monarch at Wellmynster. A free-school was founded here, about 1540, by Isabel Denton: the endowment of which has been increased by successive donations; and a Sunday school has been lately established for the children of the poor. The extent of the town and parish is computed at 3800 acres. The houses, which are chiefly brick, and irregularly built, are estimated at 545, and the inhabitants at 2605, who are divided into several religious sects; the presbyterians, quakers, and methodists have each a place of worship. Lace-making is carried on to a considerable extent; for as it requires but little ingenuity, and cheap materials, there is scarcely a female who is not provided with a lace-pillow and its necessary implements. The profits of the busineses depend on the facility of execution; and the daily earnings are therefore different. Some women can gain from eighteen-pence to two shillings a day; but others not more than one shilling. Their receipts have lately experienced a considerable drawback, from the establishment of a manufactory at Nottingham, where lace is made by machinery, and being quicker executed, is retailed at a lower price; but its quality is not so good as that made by hand. Buckingham is situated 57 miles N. W. from London. It has a market on Saturdays, and seven annual fairs. About two miles north of Buckingham are the magnificent manor and celebrated gardens of Stowe, the chief ornamental of the county, and principal seat of George Grenville Nugent Temple, marquis of Buckingham. Domelady day book contains the earliest account of this manor, and states, that in the reign of Edward the Condefor its value was 60s. and that it was held by Robert d'Ooly and Roger Ivery of the bishop of Bayeux. The present manor is a large handsome structure, seated on a high spot of ground, which slopes, in a southerly direction, to a fine lake of water. The interior of this house is furnished in the most elegant style, and contains a large collection of pictures, and a very spacious library filled with choice books, numerous manuscripts, &c. The pleasure grounds, which consist of about 400 acres, are ornamented with numerous plantations, temples, &c. and are diversified with various inequalities of ground. Beauties of England and Wales, vol. 1. "A Description of the House and Gardens at Stowe," 8vo. 1797.
Buckingham, a county of America, in the state of Virginia, lying between the Blue ridge and the Tide waters, containing, according to the census of 1790, 9779 inhabitants, of whom 4168 are slaves.

Buckingham House, the most westerly of the settlements belonging to the Hudfon bay company in New South Wales, lies north-westerly from Hudfon-house, on the northern side of Saftafawnen river, near its source. N. lat. 54°. W. long. 110° 20'.

Buckinghamshire, one of the inland counties of England, appears to have been mostly peopled, at the time of the Roman invasion, by a class of the Britons, which the historians of that period named Cattieuchani. When the Romans had subjugated the island, this part of it was included in that division named Flavia Caesariensa. After their departure, it became the theatre of many battles and revolutions, and, at length, in the Saxon dynasty, constituted a part of Mercia, to whose monarchs it became subject during the continuance of that kingdom. Buckinghamshire is bounded on the north by Northamptonshire; on the east by the counties of Bedford, Hertford, and Middlesex; on the south by Berkshire; and on the west by Oxfordshire.

Its extent has been variously estimated; but the most correct computation has been given in the General View of its Agriculture; wherein it is said to be 45 miles in length, 18 in breadth, and 138 in circumference. It contains about 518,400 acres of land, and is divided into 8 hundreds, including 16 market-towns, 185 parishes, about 21,000 houses, and about 107,440 inhabitants. Its limits are mostly artificial; the river Coln bounding only a small portion on the east side, and the Thames separating it from Berkshire.

The face of this country is much varied. The southern parts are occupied by the Chiltern hills and their appendages. These eminences are chiefly composed of chalk intermixed with flints; and though very inferior to the northern district, with respect to richness of soil, have been rendered extremely productive from the great attention given to the cultivation and improvement of the land. The prolific Vale of Aylesbury spreads through the middle of the country, and furnishes a rich pastureage to vast numbers of cattle, its astonishing fertility being chiefly employed in the support of the dairy and grazing systems. The more northern parts are diversified with gentle sand-hills, which enter from Bedfordshire. In the vicinity of the Chiltern hills, where the soil is light, and inferior to production without much labour, the most fertile land is the level, and every mode of improvement adopted. In the vale of Aylesbury, and the more northern divisions of the county, the alternating produce of the meadows rendering exertion less necessary, the farmer turns a deaf ear to every argument of an instructive tendency.

The soil of this county is principally composed of rich loam, strong clay, chalk, and loam upon gravel. Its chief application, in the Chiltern district, is to the growth of wheat, barley, oats, beans, and flax; the northern division, as we have already intimated, is chiefly applied to pasture and meadow, with a very small proportion of arable. The great quantities of butter annually made on the dairy farms, are mostly purchased by the London dealers, who contract for it half-yearly. The average weight produced weekly from each cow, is eight pounds in summer and six pounds in winter. In some of the dairies a very useful machine, called a mill-churn, has lately been introduced, by which the fatting operation of churning is greatly facilitated, the milk being worked by a horse. In other dairies a barrel-churn is used, with two handles, turned by two men, who make from six to six score pounds of butter at one churning.

The skim and butter milk are made use of to fattet swine. In the neighbourhood of Medmenham, Great and Little Hampton, &c. many calves are suckled; and at Aylesbury, and its vicinity, great attention is given to the rearing of ducks, to supply the markets of the metropolis. For ploughing, and other laborious operations of agriculture, horses are preferred to oxen. The latter have frequently been tried, but the habits of some parts of the soil, and the very heavy quality of others, have caused the farmer to decide in favour of the horse. In the southern parts, the swinging and high wheel ploughs are chiefly used, and are drawn by four horses ranged two abreast. In the northern division the loofe handle swinging and low wheel ploughs, worked by five or six horses in a line, are principally used. The progress of agricultural improvement is considerably checked on many estates, by the restrictive conditions on which they are leased; the tenants being confined to two or three crops and a fallow, with a prohibition to the growth of clover and green food. The manures are principally marl, peat-, ash, yard and rabbit dung. On some of the strong and cold soils, hair and hoofs are sown with much advantage. Soot and ashes are equally beneficial to the wheat and young clover. Farms are generally let from 601. to 2501. a year; some amount to 5001.; and two or three to 10001. In the Agricultural View of the County, the common fields were estimated at 91,900 acres, but a large proportion has since been inclosed. The waste lands are but inconsiderable, their extent not being more than 6000 acres, the greatest part contained in the heaths of Iver, Fulmer, Stoke, and Wycombe. The southern division of the county produces large quantities of fine beech near a sixth part of the land between the road to Oxford and the Thames is supposed to be covered with that wood. On Wavendon heath (now the property of the duke of Bedford) several flourishing plantations of Scotch firs have been made since its inclosure, about the year 1778. In the coppices on Whaddon chace are numbers of fine oak and ash trees. The chief manufactures are those of paper and lace. The latter affords employment for nearly all the lower classes of females in the county.

The principal rivers are the Ouse and the Thame. The Ouse enters Buckinghamshire on the western side, passes Water Stratford, and flows in a devious course to Buckingham; thence winding to the north through a rich tract of meadow land, pursues its way to Stony Stratford, Newport-Pagnell, and Oxley; from afterwards, turning suddenly to the east, it leaves the county near Brayfield. The Thame rises near the borders of the county in Hertfordshire, and flowing through the vale of Aylesbury from east to west, receives the waters of several smaller streams, and enters Oxfordshire near the town of Thame. The interchange of traffic has been much facilitated of late years by the Grand Junction canal, which enters this county near Woolverton, and running easterly, goes within a mile of Newport-Pagnell; thence, flowing to the south, it passes Fenny Stratford, Stoke Hammond, Linclade, and Ivinghoe, into Hertfordshire, near Bulbourne. From a branch of the canal at Old Stratford, a cut has been made to Buckingham, and another from Bulbourne to Wendover.

Buckinghamshire is in the diocese of Lincoln, with the exception of six parishes belonging to the see of Canterbury, and four to the diocese of London. It sends fourteen members to parliament; viz. two for the county, two for Buckingham, two for Aylesbury, two for High Wycombe, two for Amersham, two for Wendover, and two for Great Marlow. It pays twelve parts of the land tax, provides the
militia with 560 men, and is in the Norfolk circuit.

General View of the Agriculture of the County of Buck-

ingham.

BUCKLAND, a township of America, in Hampshire

county, and state of Massachusetts, containing 715 inhab-

itants; 120 miles west from Boston.

BUCKLE, in Matters of Trade, a little mettallurgic

machine, whereby to return and keep fat certain parts of

the habit, as well as of the harness of horses, &c.

The word is formed from the French boucle, and that,

according to Caffeneve, from the barbarous Latin phuscus,

which signified the same. According to Menage, from

boucle, the ainfe, or handle of a buckle. The buckle is a

part of modern dress, corresponding to the f[kras] among

the ancients. Buckles are of divers sorts, as shoe and garter

buckles; some round, others square, or oval, or cut, each of

which have their respective artificers by whom they are made.

The like may be said of the great variety of buckles belonging

to the pack and hackney faddles.

BUCKLERS, gifts, among Saxons, is a four square hord, with

a tongue, which is made steady, by going through a hole

of leather, and tailed with narrow thongs.

BUCKLER, a piece of defensive armour, used by the

ancients to screen their bodies from the blows of their

enemies.

The word comes from the barbarous Latin buc[calumen] of

buccula, the umbo or middle point of this weapon, which

had usually a head or mouth, represented prominent

thereon.

The buckle is the same with what we otherwise call shield

or target; and by the one or the other we indifferently

render what among the ancients were denominated clupeus,

featum, and para: though the three latter were different

from each other.

The featum was an oblong shield, with an iron boss or

umbo projecting from the middle; 4 feet long and 2 ½ broad,

made of wood, joined together with small plates of iron,

and wholly covered with a bull's hide. The clupeus was a round

shield of a smaller size. The para was a round buckle,

made of wood, and covered with leather.

The buckle of Achilles is described in Homer, that of

Æneas in Virgil, that of Hercules in Hesiod: Ajax's

buckler was lined with seven bulls' hides.

The buckler among the Greeks, called axios, was some-
times composed of wicker-work, and sometimes of the wood

of fig, willow, beech, or poplar; but most commonly

of hides, which were doubled into folds, and fortified with

pieces of metal. In the middle of the buckler was a boss,

upon which was fixed another prominence. A thong

of leather, and sometimes a rod of metal, reached across

the buckler, and served for hanging it on the shoulders.

Sometimes it was held by little rings; and it had afterwards

a handle, composed chiefly of small iron bars crossing each

other, in the form of the letter X. When the wars were

ended, and the bucklers suspended in the temple of the

gods, they took off the handles, that they might become

unto for immediate use. Little bells were sometimes hung

upon bucklers to strike terror into the enemy. They were

often adorned with various figures of beasts and birds, of

the celestial bodies, and of the works of nature. The bucklers

of the Argives seem to have been longer than the rest, and

to have covered the whole body. Their form was usually

round. Phil. Trans. N. 241, p. 186. See Shield. See

also Armor, and Arms.

The ancients were particularly solicitous to preserve their

bucklers in fight; it being highly unsafe, and even penal,
township in Cumberland county, and district of Maine, near Portland, containing 453 inhabitants.

BUCK-WHEAT; in Botany. See Polygonum fugo-

frym. Buck-wheat, in Agriculture, is a sort of grain much cultivated in the field in some districts. It is carretly recommended to farmers by Mr. Young, in his excellent Calendar of Husbandry, as being yet only known by name in nineteen parishes out of twenty throughout the kingdom. It po-

ffesses as many excellencies to good farmers, he supposes, as any other sorts of grain or pulse that are employed in cul-
vation; having this property of ameliorating the land, as well as that of preparing it for wheat or any other crop. It is equally valuable with barley, and where known fails at nearly the same price; and, besides its utility in fattening some sorts of animals, is the best of all crops for fowling grafs feeds with, as it affords them the same shelter as barley or oats, without depriving them of their necessary support. The time of fowing it has likewise an advantage in affording a full opportunity for getting the soil into a proper con-

dition. And there is scarcely one fourth of the expanse of a barley crop incurred in the feed.

It is sowed by some to thrive well on any soil, even tho' of the poorest kinds; and that in most of the arable districts it is sowed on the inferior forts of land, as when cultivated on the richer kinds, it is found to run too much to shrav.

Mr. Banniler, however, observes, in his Synopsis of Huf-
bardry, that it delights in land which has been reduced into good order by tillage, and has likewise partaken liberally of the dung-cart, for which reason it often succeeds a crop of turnips; and there is this advantage attending the cultivation of it, that, as, from the tender nature of the plant, it re-

quires to be fown late, it may follow a crop of turnips that has been fed off at a time when it would be highly impru-
dent to sow the ground with barley.

Mr. Young considers this as a very profitable crop on all forts of land, except the very heavy kinds, that require late fowing, and where barley cannot be put in at a sufficiently early period; as he suspects there are not many soils on which a buck-wheat crop fown in May will not be more va-
rable than one of barley fown at the same time, though it is the common practice in many districts to put that crop in at so late a season.

The lands intended for this grain should undergo a proper tillage in April, so as to render them fine and perfectly clean from weeds, especially where grafs-feeds are to be fown with it.

The proper time for fowing buck-wheat, Mr. Banniler ob-

erves, is in May, "when there is no longer any danger to be apprehended from the frosts; for for tender is this ve-

getable at its first appearance, as to be unable at an earlier period to withstand the vernal cold; and the slightest frost, in their infant state, would infallibly cut off the young shoots; and, as from this circumstance it must be fowm at a season when dry weather may be expected, the crop does on that account not unfrequently miscarry." And Mr. Young af-

fers, that it often succeeds well, when put into the ground in June, and even the beginning of July, which is considered as an advantage in a crop that prepares the land for what.

But the author of the Synopsis of Husbandry remarks,

that "being fown late, the harvest likewise falls out very backward, by which the greater part of the crop is often

devoured by the hogs in the field; so this grain seldom ripens till towards Michaelmas, when the other corn stubbles have been long open. Add to this, the injury likely to accrue from rain, which may be expected to fall in great abundance

at this season, so that the hauin, being extremely succulent, does in the most kindly harvest require a great deal of field room; but in a wet autumn it is a very difficult matter to get the crop home in good order; and in such years he has known the fraughts of buck-wheat lying abroad throughout the greater part of November." Hence there is evidently great hazard in this grain, not only from its being exposed to the ravages of the hogs, when cultivated in open fields, as before mentioned, but from the shedding of the feed; cir-
cumstances which will cause the returns to be very trifling when threshed. To this may be added the inferior value of the straw, chaff, &c. when compared with an oat or barley crop.

The proportion of feed which is necessary, must vary in some measure according to the nature of the land; but, in general, a bushel to the acre is fully sufficient. It should be well harvested in with a light short-tined harrow.

This grain generally, as has been seen, bears a price equal to that of barley, and is used for fattening of swine, poultry, and other domestic animals. "In its external form," Mr. Banniler says, "it bears not the smallest resemblance to wheat; and the method of culture, and the progress of its growth, are totally different from that grain: but, when, ground, it produces a white flour, where it may probably have gained the appellation. In Hertfordshire and Buck-
inghamshire, it is a common mode of husbandry to low turn-
ip feed with buck-wheat; but the Kentish farmers usually fow their woord or weld on their buck-wheat lands; and as the feeds of either cover a light bed, and both of these require to be fown late, the wolves generally succeed well when raised among buck-wheat; and sometimes buck-wheat, turnips, and woord are crowded together on one seazon." This is, however, a practice by no means to be generally adopted.

The proper quantity of this grain, according to this writer, "to fow on an acre, is half a bushel; and the uncertainty of the return, that five quarters have been produced from an acre in some years, while in others not so much as five bushels.

"The green haulm of buck-wheat has a peculiar inebriating effect on swine. He has seen hogs, which have fed heartily on it, come home in such a state of intoxication, as to be unable to walk without reeling."

This sort of grain is likewise, he says, sometimes "fown on fift lands, for the purpose of ploughing in the stalks as a manure. On fawds, where the land has a clayey bottom, this method may be purified to advantage; but it is to be noted, that the ground should be in pretty good heart, so as to throw out a large burthen of haulm, otherwise no benefit can accrue from this mode of husbandry." At the flaying of the fawds in May, in this mode of culture, the feed should be fowm pretty thick; and when the stalks have ar-

rived to their full growth they should be laid flat with the roller, and afterwards turned in with the plough; and when the ground has continued in this state till towards Michael-

mas, by which time the stalks of the buck-wheat will be rotted, the feed furrows for the succeeding crop should be be-
gun. "This method of ploughing in the green stalks of buck-wheat contributes, it is observed, much toward the melioration of stiff soils, and dispenses them to work more kindly than they would otherwise have done, by overcoming that adhesion, which is the greatest evil that attends this species of land."

The author of the "New Farmer's Calendar," who affirms us that he speaks from much actual experience, fays, that "the invariable result has shown its inferiority to every other grain, but superiority over other vegetable food, namely 3 N 2 carrot.
carrots, potatoes, and the like. In the state of herbage, cattle, he knows, will eat it; but it is from Hobson's choice, as a hundred trials have convinced him. Its virtues for ploughing into the land is undoubted, on account both of its bulk and succulence. The juice of it, however, is watery, and far enough from nutritious. Hogs, he has found from numerous trials, fatten neither to sail it, nor is the flesh

almost every species of weeds; an excellency peculiar to this crop. The method of ploughing buck under, and the aftermanagement of buck-fallows, are nearly as for wheat. The harvest-process is like that of barley, as is that of its
mery and management; except that the straw being fit for

Mr. Mofely of Suffolk cultivated this crop after tares, finding it highly advantageous as a preparation for wheat, by prefering the land, after that crop had been removed, from the dissipating effects of the sun till the period of the wheat being fown. This is a combination of crops by which much is effected in the opinion of Mr. Young; "a coat of

Mr. Mofely of Suffolk cultivated this crop after tares, finding it highly advantageous as a preparation for wheat, by prefering the land, after that crop had been removed, from the dissipating effects of the sun till the period of the wheat being fown. BUC, in Ancient Poetry, pastoral; a kind of

poems relating to shepherds and their flocks. The word is
defined from βουκόν, κέφαλας, κέφαλας, met; hence ἑανίκον, to feed cattle, and ἐκφαγέω, λαβομένος, a herdsman.

Bucolic poetry is the most ancient of all the kinds of

poetry; and is supposed to have had its origin in Sicily, amidst

the mirth and diversions of the shepherds; and have been

inspired by love and idleness: by degrees, their rural
galantries were brought under rules, and became an art. The

concerns of the flocks, the beauties of nature, and the

pleasures of a country life, were their principal subjects. 

Bucolic poetry is the most ancient of all the kinds of

poetry; and is supposed to have had its origin in Sicily, amidst

the mirth and diversions of the shepherds; and have been

inspired by love and idleness: by degrees, their rural
galantries were brought under rules, and became an art. The

concerns of the flocks, the beauties of nature, and the

pleasures of a country life, were their principal subjects. 

Fontenelle observes, that Theocritus's style is sometimes

a little too bucolic. Some authors attribute the invention

of bucolic poetry to a shepherd called Daphnis; and others
to Bucolins, son of Laomedon; but this appears all fiction.

Some ascribe the invention of bucolic poetry to the herds-

men of Laconia, who, not being able to hold the common-

monial feet of virgins in honour of Diana Caryatis, by reafon

of the war with Xerxes, instituted ἑανίκον, or bucolic

exercises, in lieu thereof.

Hence also the origin of a sort of poetical champions,
called ἑανίκα, by the Latins lictorii, who went about the

country, contending for the prizes frequently propofed

for the conquerors in this kind of combat; of which rank

Daphnis was the most distingufh'd. They not only re-

hearsed their verses, but played on a kind of ἄφραλις, or pipe,

Bucolic poetry is by some called Afrabas, as being suppos'd
to have first commenced among the ancient herdmen in rid-

ing a sort of waggon called γραβάς. It is usually divided

into monopropodium, or monologue, wherein only a single per-

son
son speaks, and ἀμαθεῖα, or dialogue, wherein are several interlocutors.

BUCOLICS, says Vossius, bear some resemblance to comedy, as they are both pictures and imitations of ordinary life; but with this difference, that comedy represents the manners of the inhabitants of cities; whereas bucolics exhibit rural occupations. Sometimes this kind of poetry has action, and sometimes only narration, and it is sometimes composed of both. The hexameter verse is the most proper for bucolics in the Greek and Latin languages.

Theocritus's IΔYLLIA, and Virgil's EcLOGUES, are the chief of the ancient bucolics now extant. The first modern Latin bucolics are those of Petrarch, about 12 in number, written about the year 1350. Their number multiplied so soon, that a collection of 38 modern bucolic poets in Latin was printed at Basle in 1546. Thse writers judged this indirect and disguised mode of dialogue, consisting of simple characters which spoke freely and plainly, the most safe and convenient vehicle for abating the corruptions of the church. The eclogues of Mantuan, which appeared about the year 1460, were the model of Alexander Barklay (see BARCLAY), and became so popular, that Mantuan acquired the estimation of a classic, and was taught in schools. But although Barklay copies Mantuan, the recent and separate publication in England of Virgil's bucolics, by Wynkyn de Worde, might partly suggest the idea of this new kind of poetry.

BUCORTA, in Geography, a river of Italy, which runs into the sea near Paghlapioli, in Calabria Ultra.

BUCQUET, JOHN-BAPTISTE, MICHEL, in Biography, was born at Paris, February the 18th, 1746. After passing through the usual school education, in the course of which he had eminently distinguished himself, he was sent by his father to be instructed in jurisprudence; but his disposition leading him to the study of natural philosophy, he soon quitted the law, and applied himself with zeal to acquire a knowledge of anatomy, botany, chemistry, and mineralogy, attending the lectures of the most celebrated masters, and with such affability, that he was soon qualified to become a teacher. His first course was on mineralogy and chemistry conjointly. Thence he treated in a familiar manner; and as he had made himself perfectly acquainted with the subjects of his lecture, and had a peculiar facility in communicating the knowledge he had acquired, he soon became a popular teacher. This procured him the intimacy of the celebrated Lavoisier, with whom he went through a series of experiments, to ascertain the properties of heat; they also analysed a variety of minerals, at that time but little known. 'To enable his pupils the more safely to profit by his lectures, he published an "Introduction to the Analysis of the Vegetable Kingdom." He also lent to the Royal Academy accounts of various chemical experiments, which were published with his memoirs. He had now acquired so much reputation, that on the death of M. Bourdelin, he was admitted a member of this academy. He had before, viz. in the year 1776, become a member of a society, instituted at Paris, for the improvement of medicine. To this society he lent the account of a procès for making opium transparent; for making lapis cauticeus; and a memoir on the action of volatile alkali in the deliquium, caused by carbonic acid. By these various labours, pursuèd with ardour and intemperies, he had now, though a young man, so impaired his health, as to render him incapable of performing his duties without having recourse to powerful stimulants, which, while they gave a momentary vigour, fill farther fapp'd his constitution. But as he was married, and had several children, for whom he had made but flender provision, he determined to persevere.

He has been known, his biographer says, to take two pints of water and an hundred grains of opium in a day. In this way, something similar to that practiced by John Brown of Edinburgh, he passed the latter months of his life. His last memoir, read to the academy was on inflammable air, and the means of rendering the hydrogen gas of metals as pure as that obtained during the volatilization of metals. He died on the 24th of January, 1780, escaping, by this early and premature dissolution, the keen and bitter pang he must have felt at facing his friend Lavoisier hurried to the guillotine, an event which took place, to the regret of all lovers of science, a few years after. Gen. Biog.

BUCRETIVUS, DANIEL, a physician of eminence of Brussels, was initiated into the knowledge of anatomy and medicine under Spigelius, who, a little before his death, entrust-ed him with his papers, containing his system of anatomy, with directions to publish them. This office Buretius performed with diligence, supplying such parts as were not completed, partly from his own observations and labour, and partly from the plates of Julius Caperius. Having completed this work, which was published in royal folio, at Padua, in 1626, he went to Paris, and attended for some mouths the dissections of Riolan. Riolan complaining to him, that Spigelius had introduced into his work many observations, taken from his books, without making any acknowledgment from whence he had received them, Buretius confessed he had done it, to do honour to his master. Sometime after he retired into a monastery, where he died of a dysentery, about the year 1630. Douglas. Bibllog.-Anat.

BUCTON, in Anatomy, a word used by Severinus, and some others, as a name for that part of the pudendum muliebre commonly called the HYMEN.

BUCY LE LONG, in Geography, a town of France, in the department of the Aisne, and district of Soissons, 1 league N. E. from it.

BUCZA, a town of Lithuania, in the palatinate of Brzez, 90 miles E. of Brzez.

BUD, in Botany, in its strict and most usual acceptation, as an English word, denotes the protruberances which appear in the axils of the leaves of trees and shrubs, and sometimes when there is an excess of vegetative power, on the trunks themselves, unaccompanied by a leaf; and which contain the rudiments either of separate leaves and flowers, or of both together, on an elongated receptacle, which gradually shoots out into a young branch. But, as a scientific term, it is convenient to include in it all the means employed by nature for the renewal of plants, without the intervention of fertilized seeds. A bud, taken in this extensive sense, is fatted either on the ascending cænus, or on the descending cænus, or on a tuberous radicle. On the ascending cænus, it is either a gem, or a cauline bulb: on the descending cænus, it is either a root bulb or a turio: on the tuberous radicle, it is usually called an eye. See thes e words.

BUD, in Vegetable Anatomy. The transpiration of the leaves, during their exposure to the light and heat, determines the course of the juices of the vegetable powerfully towards their points of attachment. The tubes, which convey the sap, elaborate it; the cambium is gradually formed, and deposited around the base of the leaves: it there gives birth to new tubes, which obeying the impulse communicated to them, elongate towards the bark, and penetrate it. As the spring is the season most favourable to the production of new parts, it is then that we first perceive what is called the eye of the bud, within the axilla of the leaves, or that angle formed between their base and the branch. In the course of the summer, the eye enlarges,
enlarges, and becomes a bud; it continues to increase during the summer, and in the winter falls into a state of torpidity; in the ensuing spring, however, it revives, and expands into a branch or incipient branch, which acquires solidity in the flower, and becomes clothed with leaves or flowers.

The period required for the evolution of the buds is subject to vary; it is sometimes retarded for five years; as other times accidental causes accelerate this process. Thus, if the leaves, which accompany the buds, happen to perish, their development is so much more rapid, that these buds produce branches containing leaves and flowers in autumn, which, in the ordinary course of vegetation, would not appear before the ensuing spring. These unimally productions, however, are destroyed by the first frost.

The buds of the same tree are not all developed in the same time, some being more exposed than others to the action of air and light. In general, those situated at the extremity of the branches are the first to unfold themselves.

The position and figure of the buds are peculiar in each genus, and often serve to characterize the species of plants. A knowledge of these distinctions is found very useful by those who rear trees in nurseries.

Bomnet arranged buds into five orders, according to their position upon the branch. In the first they occur alternately as in the willow tree. In the second, they arise opposite to each other as on the aspen. The third mode of arrangement is, when the buds surround the branches in a ring; the example of this which Mr. Bomnet quotes, is the plum-granata; but all the young branches of this tree have the buds placed opposite. The fourth position of the buds is, where they form, with respect to each other, quincuncial, and, when taken together, compose a spiral figure, which surrounds the branches in the manner of a cork-screw. This takes place in many fruit-trees, but more especially in the plum-tree. In the fifth order are those trees which have the leaves surrounding the branches in a double spiral, as they appear in the pine. The true buds of the pines do not, however, grow in the axil of the leaves, but on the extremity of the branches.

In the trees with opposite buds, the extremity of the branches are usually furnished with three buds, the one in the middle being much the largest; and when the buds are placed alternately, the branch is commonly terminated by a single bud.

The direction of the buds is different in different species; sometimes they stand out from the branch, that they form with it a right angle, as may be seen in the lilac; in other instances, as the cornel tree, they are chiefly applied in all their length to the side of the branch. The plum散步, the buds at the extremity of the branches are bud close, as those of the cornel-tree; whilst those on the other parts of the branch are directed upwards.

There are numerous other peculiarities in the form and appearance of the buds, which, although useful for the gardener to know, it would be tedious to enumerate in this place.

No annual plant can, with propriety, be considered as possessing buds; these parts being intended to survive the winter, and contain the rudiments of the branches and flowers, which are to be developed on the return of the season of vegetation. The true bud ought not, therefore, to be confounded with those small cones found in the axil of herbaceous plants, and which are converted into branches in a few days. The liliaceous plants, and other monocotyledons with bulbous roots, do not produce buds in the axil of their leaves: the bulbs of these vegetables perform all the functions of buds, and have, therefore, very properly been ranked as such, and called by some writers subterraneous buds.

Although we acknowledge the finitude of these two parts to each other in the fullest extent, we prefer giving the description of buds under their proper name.

See **Bud**.

Besides the varieties of buds which serve to distinguish different genera, and sometimes the species of plants, there are other peculiarities which characterize the nature and offices of different buds among the same tree; some buds being intended to develop the leaves and branches; others to contain only the parts of fructification; and others again give origin to both leaves and flowers. Those of the first kind are called the leaf buds, or buds with wood; the second, the flower or fruit-buds; and the last are termed the mixed buds. The cultivators of fruit trees are careful to discriminate the different kinds of buds, as a guide in the various operations of grafting, pruning, &c. The leaf-buds, compared with the others, are slender, long, and pointed; the fruit-buds are thick, short, and round; and those of a mixed nature, have an intermediate form, being neither fo pointed as the one, nor fo round as the other.

In a great number of trees, the flower buds are situated upon the extremity of the little ramifications, called fruit-branches. See **Branches**. Fig. 9. of Plate II. in Vegetable Anatomy, represents a fruit-bud of the pear-tree, fulltained by one of these little branches a the branch, b the bud; and on the neighbouring branch upon which one grows, is seen a wood-bud, indicated by c.

In the peach-tree, and many others of the same family, the wood and fruit-buds arise together from the same branch; this is shown by fig. 10. of Plate II. in Vegetable Anatomy: a is a short portion of a branch of the peach-tree, on which are placed three buds; b, b, the two external buds contain the flowers &c. the intermediate one is the wood-bud.

When the male and female flowers are situated upon different parts of the same plant, or upon separate individuals, it is proper to distinguish the flower-buds into two kinds; as in many species, the buds, which furnish the catkins, are very unlike those which produce the fruits; thus, in the walnut-tree, the fruits owe their origin to the buds placed along the length of the branches, whilst the catkins proceed from other buds so very small that they are hardly perceptible, and which are situated at the side of those which furnish the fruits.

The buds of almost every vegetable, which is congenial to a northern climate, are clothed with a number of scales, and a cotton-like substance. The scales are laid upon each other in an imbricated manner, or like the tiles of a houfe. Those situated most externally are long, hard, and dry, and generally of a brown colour, but the scales which are covered by others are more plant, tender, and succulent; and the nearer they approach to the centre of the bud, they acquire more of the herbaceous texture of young leaves, the internal scales are usually of a pale green or white colour. The scales are very generally lined with a downy or cotton-like substance. This becomes dry and coloured upon the external scales; but where it is shielded from the action of the air, it remains soft and white, not unlike the downy surface of sainin. The form of each scale is that of a spoon or shallow oval cup, with one extremity more thin and pointed than the other. The surfaces of the scales are usually beincarded with a rivicd matter, of a gum reinous nature; this becomes involved in the down, and forms a perfect barrier to the transflusion of air or moisture to the internal parts of the bud; and not unfrequently the reinous matter is so abundant, that it exudes upon the external surface of the bud, giving it all the appearance of being coated.
coated with varnish, as may be observed on the buds of the 

_horse-chestnut, the jacanilla, &c._

If those buds, which have their supersicacies imbued by a

refined substance, be removed from their situation, and if

the surface which unites them to the branch be covered with

wax, they may be suffered to lie in water for several months,

without experiencing any alteration; ay, it is stated by

Mirbel, that this experiment has been prolonged for some

years, without the least injury to the buds.

On prosecuting the dissection of the bud to its centre, we

discover either the rudiments of the future branch, or the

parts of the fructification in extreme miniature. In the

wood-buds, the embryo of the branch consists of some

fuculent filaments, or imperfectly formed leaves, folded

together and supported upon a tender football, very similar to

the plumule of the trunk contained in the grain; and in the

fruit-buds, the parts composing the flower can be dis-
cerned at a very early period, although in a very soft and

half organized state.

Both the rudiments of the branch and flower undergo a

continual, though secret development, during their exis-

tence in the bud; which has been ascertained by dissections

of the buds, instituted at different periods of their growth.

The little plumule of the branch can be discovered as soon

as the bud is fairly formed, and continues gradually to

acquire more perfect organization, until it bursts from its

nidus in the full leaflon of vegetation. The rudiments of

the blossoms of the peat-tree are to be seen in the month of

January, in a group of eight or ten flowers, attached by

filaments to a common peduncle. In the midst of these

little flowers there are several minute, thin leaves, of various

forms, and of a pale green colour, which Duhamel conceives

are designed to perform the same offices, with respect to the

embryo-flower, that the feminal leaves answer in the seed.

The lamina may be observed, at this period, within the

flowers, but as yet almost transparent. The petals are

difficult to discern, and the pistils cannot be detected. In

the month of March the tops of the lamina are red; the

petals, although small, may be clearly perceived, and even

the pipes may be distinguished; they are white, and each

nourished by a particular filament: it is probable, that the

pipes, and all the essential parts of the fructification, are

equally with the bud itself, although their softness and trans-

parency prevent their being distinguished: so just was the

observation of Crew, that the flowers of the spring were

formed in the preceding year.

The structure of the wood and flower buds is exemplified in

Plate II. in Vegetable Anatomy. Fig. 11. exhibits the ex-

ternal appearance of the bud of the horse-chestnut, which is

selected for the sake of its great size. The scales are seen

laid one over each other, like the tiles of a house; and their

more pointed extremities being turned upwards, and all their

dges in close contact, as the bud appears in winter. At

the base of the bud may be seen some projecting rugae, and

immediately beneath these the impressions left from the

attachment of the former leaves. Fig. 12. shows a longi-

dudinal section of the same bud; a, the brown scales which

form the external envelopes; b, the tender scales situated

more internally, and becoming more thin, pliant, and folded,

the nearer they are to the centre; c, the imperfectly-formed

leaves of the young branch comprehended together, and

involved by the white down or cotton-like substance; d, the

bark of the branch which sustains the bud; e, the ligious

portion of it; f, its pith. Fig. 13. represents a bud of the

horse-chestnut, deprived of its scales in order to bring into

view the vegetal branch, which has its parts separated a little,

and cleaved from the down which envelopes them, that they

may be more distinctly observed. The marks appearing

beneath the plumule, point out the attachments of the

scales, which have been removed.

The fourteenth, fifteenth, sixteenth, and seventeenth figures

in Plate II. in Vegetable Anatomy, are intended to explain the

structure of the fruit-bud. Fig. 14. is the fruit-bud of the

peach-tree, divided longitudinally, and considerably mag-

ified; a, a, indicate the umbilicated scales which compose

the external envelope of the bud; b, b, refers to the cut edge

of the calyx of the flower, which, in the embryo state, forms

a complete circle, including the parts of fructification; c, c, are

the lamina, almost pellucid; d, the pistil. Fig. 15. exhibits

one of the scales abstracted from its situation, and highly

magnified; it appears entirely covered by villous processes.

Fig. 16. shows the flower bud of the peach-tree, a little larger

than the natural size, as it appears without its coverings; a, is the calyx, with its edges applied to each

other, so as to form a perfect cylinder. Fig. 17, is the same

calyx drawn a little larger, and with its leaves separate from
each other, and turned back to expose the lamina; and in the

pistil within the calyx may also be seen the rudiments of

the petals.

The buds of the pine differ in many respects from those of

other trees. According to Mr. Tichond, who has described

these buds, they are placed always on the extremity of the

branches; they are commonly numerous, the bud, which is

at the extremity, being succeeded by others much smaller

than itself; they are all contained in one membranous sheath,

formed of many cylindrical pieces, adjusted the one to the

other, and accompanying the development of the bud.

When it first appears it is about two fingers in length; it

then continues to extend, soon becomes large, and the lit-
tle leaves, which have been hitherto sealed up, unfold them-
selves, and the branch comes forth. It is possible to dis-
cover, a long time before the buds are matured, those which are to

appear upon the extremity of the branch.

It is difficult to decide with certainty what are the parts of

the branch from which the buds, in the first instance, are
derived. When the bud makes its appearance, it is so im-
pertinently organized, that it scarcely admits of dissection, or of

being distinguished into those parts which it ultimately ex-
hibits. Accordingly, we find, that anatomists have held

different opinions upon this subject: Pontedera con-

ceived that the rudiments of the buds were lodged in the

wood alone. Duhamel supposed that all the parts of the branch

were continued into the bud; the internal part of the

bark being prolonged to form the scales, and the bark of the

plumule: the ligneous fibres giving rise to those of the

embryo branch, and the pith being extended into the interior

of the different parts of the bud. On the contrary, Hill and

others assert, that the buds are formed exclusively by

the parenchyma. The scales of the bud, however, appear

to be leaves which have never arrived at maturity: this is

the opinion of Mirbel, who illustrates with much inge-

nity; he supposes that the leaves, which afterwards appear

as the scales of the bud, are rendered abortive, by the abate-

ment in the circulation of the sap, which takes place on the

approach of winter; for, if the motion of the sap were to be

either totally suspended, or not impeded at all, no scales

would form, which is exactly what may be observed in a few

trees which inhabit cold countries, and in most plants that are

natives of hot climates. If, also, the top of a tree be cut

off before the evolution of the buds, those which are after-

wards developed are unfurnished with scales.

Around the base of the bud there is always a degree of

tumefation of the branch, which is called a _burr_; this is

formed at the eruption of the bud, and enlarges in all direc-

tions,
tions, before the scales fall, and the parts contained in the
bud are unfolded. The burs is supposed to answer two very
important purposes: with respect to the bud, the first is to
supply the place of the leaves, by collecting a greater portion
of the sap around the root of the bud, and thus supporting it
during its hybernation, and yielding, during the season of
interrupted vegetation, a degree of provisional nourishment
to the embryo branch or flower, which is necess-
ary for the secret development they are known to expe-
tience. The other use of the burs appears to be to separate
the scales of the bud from each other previous to the ex-
pansion of the flower; this is accomplished by the enlarg-
ment of the burs on the return of spring. It is evident,
the slightest separation of the scales, at their origin, must
cause a considerable one of their unattached edges; without
the affluence derived from the growth of the burs, it seems
quite impossible that the tender plumule of the branch or
the embryo flower should ever be able to force its way
under the hard and unyielding scales that enclose them, more especially
in those instances where the scales are agglutinated to each
other by the gum-rinus matter.

In some experiments which were undertaken by Senebier
upon the buds of the objects, apple, and pear trees, he found,
that by depriving the flower-buds of their scales and little leaves,
he did not interrupt the evolution of the flower, nor prevent
their going on to produce fruits. Senebier accounts for the
flowers surviving the privation of their scales, by supposing
that the burs is in some degree might supply their place.
The most extraordinary circumstances in the history of
buds, are the conversion of flower-buds into wood-buds, and
that of wood-buds into flower-buds. The former is related
as being effected by Mariotte in this manner: he deprived,
in the latter part of the month of August, a rose-tree of its
branches and all its leaves, and suffered them remain only the
buds, which ought to produce flowers the ensuing spring;
these buds continued to grow, but when the period of their
development arrived, instead of furnishing flowers they put
forth leaves and branches.
The conversion of the wood-buds into those bearing fruit
is accomplished by a variety of means, practised by common
gardeners. Thus, if the upper part of a branch be cut away,
the buds near the extremity of the remaining stem, from
acquiring a greater proportion of supply of nutriment, will
produce leaves and wood, which might otherwise have been
flowering-buds; and, on the contrary, if a vigorous branch
of a wall-tree, which was expected to bear only leaf-buds, be
bent down to the horizon, or lower, it will bear flower-buds,
with weaker leaf-buds. On this circumstance chiefly depends
the management of wall-fruit trees, and of espaliers. For
the purpose of converting leaf-buds into flower-buds it has been
also recommended: to bind some of the most vigorous shoots
with strong wire, and even some of the large roots. Some
gardeners score the bark in a spiral direction, or cut off an
entire cylinder of the bark, three or four inches long, and
replace it with a proper bandage.
The bud appears to fulfil nearly the same purposes in the
vegetable economy as the seed. It contains the embryo
of the branch or of the flower, and shields it from the operation
of the air, the light, and moisture, and the vicissitudes of tem-
perature, until it is enabled to withstand these influences by
a full exercise of the functions of vegetable life. By this
means the internal parts of the bud are capable of gradually,
though invisibly, developing themselves, like the plantule
of the seed, independently of the vegetable from which they have
drawn their existence. The bud also, like the grain, admits of
removal from its original connexions; of having its actions
suspended for an indefinite period, and afterwards of having
them renewed at pleasure; of deriving, by transplantation or
grafting, its sustenance from different sources; and, lastly,
on being laid in the earth, of producing an interior plant in a
similar manner as the seed, when placed in the same
circumstances. As the seeds are the oviparous progeny of vege-
tables, the buds may be considered as the viviparous offspring.
They appear to differ chiefly in this circumstance, that the
seeds always result from a sexual congress, and partake of the
properties of both parents; whereas the buds proceed di-
rectly from one parent, to which their productions afterwards
bear a perfect resemblance.

Buds are used, in Country Language, for a weaned calf
of the first year; so called, because the horns are then in the
bud.

BUDA, in Geography, called by the Germans Offen, the
ancient metropolis of Hungary, is seated on an eminence
on the west side of the Danube, and is connected with
Poth, situate on the opposite side of the river, by a bridge of
boats about 4ths of a mile in length, and consisting of 63
large pontoon. The old city is seated on a plain extending
itself from the suburbs of New Buda to the space that lies
between the Pilis mountains and the Danube, and was
formerly called "Scienia." But this is now a wretched
place, and affords nothing remarkable besides the ruins of an
old aqueduct, built either by the Romans or Hungarians.
A wide fosse surrounded was discovered, with which the
Turks seem to have been well acquainted, and which leads
from this place to the citadel of Buda. New Buda is
a royal free town. It was formerly the capital of the king-
dom; and, in its connection with Poth, the largest and finest
of all the Hungarian towns, and the residence of the kings.
The houses are mostly constructed of square stone; but since
the Turks took possession of it, they suffered the fixed build-
ings to sink into decay. The lower part of the city, called
the "Jew's town," extends like suburbs from the upper
city to the Danube. The higher town occupies the decliv-
ity of a mountain, and is fortified with walls and towers.
The castle, seated on an eminence towards the east side, com-
mands the greatest part of it, is encompassed by a deep
moat, and is defended by an old-fashioned tower, to which
some new fortifications have been added. One suburb
is enclosed with hedges. The most formidable of its present
structures are the canvassers, mosques, bridges, and baths.
The chief public and private buildings are in Poth, and
within the fortresses; the royal palace in particular is a
large and lofty edifice. The form of Poth is quadrangular;
and it has, besides the royal palace, a military hospital, with several
churches and convents. At a little distance from it is a field,
in which many diets have been held, and where the cities
of Hungary formerly met on horseback, and in arms, to deth
their king. Among the decayed buildings of Buda, the
city of the Ascension of the Virgin Mary is the principal,
near which the Jefuits have an academy or college and sem-
nary. The Carmelite nuns have a convent, and the Fran-
ciscans have churches. Both Catholics and Calvinists are
allowed the free exercise of their religion; and the Jews
have a synagogue near the castle garden. But the most
famous edifices of Buda are its baths; of which there are
two parts, the upper or Trinity baths, and those of Mustafa,
who was governor of the place, and built them with
stone, covering them with lead. Some of these waters are
of such moderate temperature, that they may be used in
their natural state either for drinking or bathing; but others
are so hot, that they must be mixed with cold water, or
conveyed to cool in other baths, before they can be used.
The adjacent country is fertile, though not well cultivated;
and affords good wine and excellent melons.
This city was the residence of the Hungarian monarchs, till it was taken by the Turks, under the sultan Solymán, in 1526; but though they were defeated of it the next year by Ferdinand, archduke of Austria, they recovered it again in 1529. Although it was afterwards frequently besieged, it continued under the dominion of the Turks till the year 1686, when it was besieged and taken, after an obstinate resistance and great slaughter, by the duke of Lorraine. From this time it has remained under the dominion of the house of Austria. In 1784, the seat of the provincial government, and the public offices, were removed from Pressburg to Buda; and, therefore, this city, joined with Pesth, may still be regarded as the capital of Hungary. The population of Buda is estimated at 20,000; but if Pesth be included, it may be computed at 31,000. Dr. Townson, (Travels in Hungary, 4to. 1796.) states it at 38,000. The university of Buda, as we are informed by this traveller, poffefles an income of about 20,000l. sterling, of which only 4000l. are applied towards paying the salaries of the professors. Besides the usual chairs which exist in every university, there are those of natural history, botany, and economy. The instruments for natural philosophy, and the models of machines are good; and the museum of natural history, which contains the collection of the late professor Pillar, besides that of the university, may be ranked among the finest collections of Europe. Buda is distant 125 miles E.S.E. from Vienna, and 15° N. N.W. from Belgrade. N. lat. 47° 30'. E. long. 16° 10'.

BUDA, a town of Lithuania, in the polatinate of Wilna; 80 miles E. of Wilna.

BUDÆUS, William, in Biography, one of the most learned men of the 15th century, and a descendant of an ancient and honourable family, was born at Paris, in 1467; and having passed through the grammar schools at Paris, and having spent three years at Orleans, in the study of the law, to little or no purpose, he conceived a disgust at the prevalent barbarism of literature, and devoted himself wholly to youthful pleasures. At length, however, he was seized with an ardent passion for literary pursuits, which induced him to abandon every amusement, and to dedicate his whole time and attention to study, so that he scarcely allowed himself the necessary intervals for his meals and rest. By means of unwearied industry, first without any assistance, whence he called himself autem, and after he had acquired the advantages of instruction from Harmonius, whom he retained at a large salary, and from Laferriere in Greek, and James de Vere in mathematics, he acquired singular reputation as a scholar, and particularly for an acquaintance with the Latin and Greek languages. He had reason, however, to regret that want of early practice, which is adapted to form ease and elegance of language; and hence his style, both in French and Latin, though strong and vigorous, was harsh and perplexed. His first literary performances were translations of some treatises of Plato; and, in 1528, he published "Notes on the Pau-ducts." But his principal reputation among the learned was owing to his treatise "De Afe," which contributed in a very eminent degree to facilitate the study of the ancient coins, weights, and measures. The fame which he thus established excited envy among his contemporaries; and Erasmus, though he acknowledged his merit, became jealous of him, so that a disagreement took place between these two distinguished persons, which prevented Budæus's citing Erasmus in his works. By avoiding the topics which might occasion a suspicion of his faith, he precluded those objections to the revival of learning, to which the interested and the ignorant were at that time disposed to recur. Upon his first introduction to the French court, he was employed by Lewis XII. in two embassies to Italy, and appointed the king's secretary; and in the reign of Francis I., who distingukshed himself by his patronage of learned persons, he obtained the place of master of requests, together with the office of librarian and secretary to the king; and was deputed on an embassy to Leo X. He was also chosen provost of the merchants of Paris. At his request, in concurrence with that of Du Bellay, Francis founded the Royal College, for giving instruction in the languages and sciences. During his progress with the king in Normandy, in 1540, he was seized with a fever, and this terminated in his death, after his return to Paris, in the 73d year of his age. His funeral was performed, in conformity to his express orders, privately, and by night; and this circumstance gave his enemies occasion to charge him with having adopted the sentiments of the reformers, though he had implicitly, and even acrimoniously, condemned them in some of his publications. He had also occasionally declaimed with vehemence against the court of Rome, and the corruptions of the clergy. The suspicion, however, was confirmed by the removal of his widow to Geneva, where she, and two of his sons, avowed themselves protestants. Of his character it is said, that it was fair and honourable; though Bayle observes concerning him, that he was more fearful than beloved in the republic of letters; and that in his disputes with Erasmus he was the least moderate of the two. His works were collected and printed at Bâle, in 1557, in 4 vols. fol. Besides the treatises already mentioned, he wrote "Commentaries on the Greek and Latin Languages," and a "Treatise on the Instruction of a Prince," dedicated to Francis I. Gen. Dirf.

BUDARIN, in Geography, a town of Ruffian Tartary, in the government of Causcaus, on the west side of the Ural; 36 miles S.S.W. of Uralb.

BUDAWUN, a town of Hindostan, in the country of Malwa; 240 miles S. of Delhi, and 132 N. E. of Ougein.

BUDEYOUN, a town of Hindostan, in the country of Odude; 24 miles S.W. of Bereilly, and 70 N. E. of Agra.

BUDEUS, John-Francis, in Biography, a learned and diligent professor and writer, was born at Anhaim, in Pomerania, in 1667; and after having acquired a large fund of learning in the languages, as well as in philosophy and divinity, he first gave private lectures at Jena, and in 1692, was appointed professor of Greek and Latin at Coburg. From thence, he was removed by the invitation of Frederick, elector of Brandenburg, to the chair of moral and political professor in his newly founded university of Halle. After continuing in this situation 12 years, he re-assumed the professorship of theology at Jena, where he died, in 1729. Besides the diligent discharge of his professional duties, he maintained an extensive correspondence, and wrote many works. Of these the principal are, "Elementa Philosophiae practicae, instrumentariorum et theoreticae," 3 vols. 8vo., which served for a long time as a text-book in the Protestant German Universities: "A System of Theology," 2 vols. 4to. much esteemed by the Lutheranes: "The great German Historical Dictionary," 2 vols. fol. ; "A Treatise on Athens and Superstition," 8vo., translated into French; and "Miefeclannus Sacra," 3 vols. 4to. Nouv. Dirf. Hist.

BUDDEKANO, in Geography, a town of Hindostan, in the country of Agimtore, fented on the river Pudder; 82 miles W. of Oudipour, and 100 N. of Amedabad. N. lat. 24° 30'. E. long. 72° 50'.

BUDDENBORG, a town of Germany, in the circle of Wolphalia, and county of Marsch; 2 miles N. W. of Lune.

BUDDLESDALE. See BOTE-SDALE.
BUD

BUDGING, or Grafting, is a method of propagation, peculiar for various sorts of trees, but particularly those of the fruit kinds. It is the only method which can be had recourse to with certainty, for continuing and multiplying the approved varieties of many sorts of fruit and other trees; as although their fruits readily grow, and become trees, not one out of a hundred, so raised, produces anything like the original, and but very few that are good. But trees or bushes raised in this manner, or being budded with the proper sort, the buds produce invariably the same kind of tree, fruit, flower, &c. continuing unimpeachable the same afterwards.

This mode of propagation is particularly useful for pears, medlars, and apricots, which succeed better by budding than by grafting; and are usually worked upon plum or currant stools, raised from seed, and sometimes, from those raised from suckers, layers, and cuttings. These sorts of trees are often likewise budded upon stools raised from the kernels of these kinds of fruit; they are, however, more strong and durable, in general, when grafted upon plum stools. Plum and cherry trees are also often propagated by budding, as well as by grafting; the second sort is, however, generally the more successful by the latter method, as being more apt to suck and go off by budding. These different sorts being of the same genus, grow upon stools of each other, but much the best upon their own stools, as plum upon plum, and cherry upon cherry stools.

Apples and pears may likewise be propagated by the budding method, as well as by grafting; but as they grow freely by grafting, which is the most easy and expeditious, they are more commonly increased in that method. In short, most kinds of fruit trees, as well as others, that are capable of being propagated by budding, also succeed by budding; budding is, however, more adapted to some sorts, and budding to others. Various sorts of forest and flowering trees, deciduous as well as evergreen, may likewise be propagated by budding, which is a certain method to continue particular varieties, such as many of the variegated leaved kinds, as the variegated holles, and many other sorts. The budding in almost all sorts, is performed on young trees raised from seed, suckers, layers, &c. which, when raised purposely for budding and grafting upon, are called stools; and which, after becoming about half an inch thick in the bottoms of the stems, or a little more or less, according to circumstances, are of a proper size for the purpose, though it may be performed upon stools from the size of a goose quill to an inch, or more, being mostly done upon stools or trees of the same genus.

The stools for this use, are commonly, as has been observed, raised from seed, as the kernels or stones of those different sorts of fruit, &c. sown in autumn or spring in beds in the nursery an inch or two deep, which, when a year or two old, should be transplanted into nursery rows, two feet a-furder, and fifteen or eighteen inches distant in the rows, to stand for budding upon, keeping them to one item, and suffering their tops to run up entire; when of two or three years growth, or about the size of the little finger at bottom, or a little more, they are as has been seen of due size for budding upon. Stools raised from suckers arising from the roots of the trees of these different sorts, layers, and cuttings of them, are also made use of; but they are not so good for the purpose. Budding may likewise be performed occasionally upon trees that already bear fruit, when intended to change the sorts, or have different sorts on the same tree, or to renew any particular branch of a tree; the operation being performed on the young shoots of the year, or of one or two years' growth only.

The most proper season for performing the operation of budding, is from about the middle of June, until the middle or latter end of August; some, however, begin to bud in June, but the buds infected so early are apt to drop in the same year, and these not having time to harden, are liable to be killed in winter. The buds for this use should in general be taken only from the young shoots of the year, as those of the same summer's growth, which must be cut from the trees of the sorts intended to be propagated, always choosing them from healthy thriving trees; and if fruit trees, from such as bear the finest fruit of their respective kinds and varieties. A quantity of the heart moderately strong young shoots should be cut each day as they are wanted; and as they are gathered, the leaves cut off, but not quite close, referring about a quarter of an inch of their foot-flasks, trimming off also the soft unopened top end of each cutting, covering them from the sun and air, and taking them out as wanted. As each cutting furnishes many buds, they are to be cut off about an inch and a half long, one at a time, as they are infected in the stools. Those in the middle part of the cutting are preferable to those towards each end; though in cases of scarcity of cuttings, every one of them may be used. One bud only is in general infected in each stool; some, however, place two on each side opposite each other.

The most proper height to bud stools varies according to the intention, but from about three or four inches to six feet or more from the ground is practiced. To have dwarf trees for walls and espaliers, &c. they must be budded from within about three to six inches from the bottom; that they may first furnish branches near the ground; for half standards, at the height of three or four feet; and for full standards, at about five or seven feet high; the stools being trained accordingly.

The necessary implements and materials for this purpose, are a small budding knife for preparing the stools and buds for insertion, having a flat thin haft to open the bark of the stools in order to admit the buds; and a quantity of new bars or rings well moistened, to tie them with.

In performing the operation of budding, the head of the stool is not to be cut off, as in grafting, but the bud inserted into the side, the head remaining entire till the spring afterwards, and then cut off. A smooth part on the side of the stools at the proper height, rather on the north side, away from the sun, should be chosen; and then with the knife, an horizontal cut made across the rind, and from the middle of that cut, a slit downwards about two inches in length, in the form of the letter T, being careful left the stool be wounded. Then having cut off the leaf from the bud, leaving the foot-flask remaining, make a crofs cut about half an inch below the eye, and with the knife slit off the bud with part of the wood to it, somewhat in the form of an ellipse, pulling off that part of the wood which was taken with the bud, being careful, that the eye of the bud be left with it, as all those buds which lose their eyes in trimming, should be thrown away as good for nothing; then having gently raised the bark of the stool where the crofs incision was made with the flat haft of the knife clear to the wood, thrust the bud in, placing it smoothly between the rind and wood of the stool, cutting off any part of the rind belonging to the bud, which may be too long for the slit; and after having exactly fitted the bud to the stool, tie then closely round with bars, beginning at the under part of the slit, and proceed to the top, taking care not to bind round the eye of the bud, which should be left open, and at liberty. When the buds have been inserted about three weeks or a month, examine which of them have taken;
taken; those which appear shrivelled and black being dead, but such as remain fresh and plump are joined; and at this time, loosen the bandage, which, if not done in time, is apt to pinch the flock, and greatly injure, if not destroy the bud. The March following, every tree from the flock about three inches above the bud, flensing it that the outer may pass off, and not enter into the flock. To the part of the flock which is left, some often the shoot which proceeds from the bud, to prevent the danger of its being blown out, but this must continue no longer than one year; after which, it must be cut off close above the bud, that the flock may be covered over by it. Some advise it to be cut close off at first, which is probably the bell practice. But though it is the ordinary practice to divide the bud of that part of the wood which was taken from the shoot with it, yet in many sorts of tender trees, it is better to preserve a little wood to the buds, without which they often miscarry. The not observing this, has occasioned some to imagine, that some sorts of trees are not to be propagated by budding, which, if performed in this method, might have succeeded. Where this has been done, the whole effort of the flocks being directed to the infected buds, they soon push forth strongly, one shoot from each; many shoots also arise from the flocks, but these must be constantly rubbed off as often as they appear, that all the power of the flocks may be collected for the vigorous growth of the bud shoots, which now commence trees; and which, by the end of the summer, will, in some sorts, be advanced three or four feet in height. In the autumn or spring following, the young trees may be transplanted into the places where they are to remain, or remain longer in the nursery, according to the purpose for which they are designed. In trees that are designed for fruit on walls, espaliers, or as dwarfs, the first shoots from the buds should, in the spring after they are produced, be headed down to four or five eyes to force out some shoots near the bottom; but if designed for half or full standards, and budded at proper heights, the first shoots of the buds may either be shortened as above, to four or five eyes to provide lateral branches near the top of the stem, to form a spreading head, or be suffered to grow up in height, and branch out in their natural way, by which they will form more erect heads of loiter growth. Such half or full standards as are designed for walls, and were budded high on the flocks, must also necessarily have the first shoots headed down in the spring following, to force out lateral shoots to furnish the allotted space of walling; and on the other hand, where trees are designed for any sort of standards, and budded low on the flocks, the first shoots of the buds should be trained up for items to a proper height before they are flopped, and then topped to throw out shoots to form heads of the desired heights. See Isocula.

BUDDLE, in Mineralogy, a name given by the English dressers of the ores of metals, to a sort of frame made to receive the ore after it is refined from its grossfoulness.

The ore is first beaten to powder in wooden troughs, through which there runs a continual stream of water, which carries away much of it as is fine enough to pass a grating, which is placed at one end of the trough; this falls into a long square receiver of wood, called the launder; the heavy, vitell, and purest of the ore falls at the head of the launder, is separated out separately, and requires little more care or trouble; but the other part, which spreads over the middle and lower end of the launder, is thrown into the bud, which is a long square frame of boards, about four feet deep, six long, and three wide; in this there stands a man barefooted, with a trembling shovel in his hand, to call up the ore about an inch thick, upon a square board placed before him as high as his middle; this is termed the "buddle bud;" and the man dexterously, with one edge of his shovel, cuts and divides it longitudinally, with respect of himself, about half an inch in the middle of these little cuts; the water coming gently from the edge of an inner plate, plain board, carries away the slith and lighter part of the prepared ore flint, and then the metal part immediately after; all falling down in the buds where, with his bare feet, he stirs it and smooths it, that the water and other heterogeneous matter may then pass off from it.

When the budule by this means becomes full, the ore is taken out; that at the head, being the flint and purest, is taken out separate from the rest, as from the launder. The rest is again trampled in the same budule; but the head, or, as it is called, the forehead, of this budule, and of the launder, are mixed together, and carried to another budule, and trampled at will. The forehead of this last budule, is that part of the ore which has fallen at the head, is carried to what they call a drawing budule, whose difference from the rest is only this, that it has no tye, but only a plain floping board, on which it is once more walked with the trampling shovel. Tin-ore, when it is taken from this, is called black tin, and this is found to be completely ready for the blowing-houle. Phil. Trans. No. 60. See Dressing of Ore.

Gen. char. Cal. Periannum very small, four-cleft, acute, erect, permanent. *Cor. petal-lobed, bell or funnel-shaped, four-cleft, erect, longer than the calyx, segments ovate or oblate. Stam.* Filaments four, very short, inserted below the divisions of the corolla; anthers very short, filiform. *Pist.* Germ superior, ovate; stigma obtuse or bifid. *Ovul.* ovate, two-furrowed, two-celled, two-angled (each finally dividing into two, Joff. partition double, parallel to the valves, Gart.)

A shrub, nine or ten feet high. *Branches tomentose. Leaves opposite, acute, narrowing at their base into the petiole, green above, white beneath. Flores* yellow, small, bell-shaped, sessile on the common peduncles. Lam. A native of the West Indies, sent to Sir Hans Sloane from Jamaica by Dr. Houlton in 1731. 2. B. *occidentalis*. Lam. Phil. t. 210. f. 1. is referred to by Lamuxus, but La Marek thinks that that figure does not express any species of this genus. Gart. t. 4. j. 7. Lam. Illust. Pl. 69. f. 1. "Leaves lanceolate, acuminate, slightly serrated; spikes interrupted, somewhat panicled." Lam. It differs from the preceding in having longer, narrower, and less serrated leaves, white flowers, and interrupted spikes. Lam. Swartz doubts whether it be more than a variety. Miller, in addition to the distinctions mentioned above, La Marek, says that it has long, narrow, pear-shaped leaves between the spikes; whereas those of the former species are naked. Sent to Mr. Miller from Carthagena by Dr. Houlton. 3. B. *biformisfolia* Lam. Illust. "Leaves ovate-oblong, slightly scolloped, much

Propagation and culture. The americana, occidentalis, globosa, and falfifolia, are the only species which have hitherto been cultivated in Europe. The americana and occidentalis must be raised from seed fcent in their capsites from their native country, which should be sowed in small pots, and very lightly covered with rich, light earth. The pots should be plunged into a moderate hot-bed, and gently watered every third or fourth day. If the seeds are fresh and good, and in fown in the fpring, the plants will come up in about fix weeks, and may generally be transplantied in about two months after. They should then be planted separately in similar pots and earth, shaded from the sun, and occasionally watered. After they have taken root, they should have fresh air every day, according to the warmth of the fearon, and be moderately supplied with water. About the middle of August it will be proper to shift them into larger pots, and to turn over the tan in the bed, that the heat may be renewed. In the autumn they must be removed into the flove, where they must constantly remain plunged in the tan-bed. In the winter they should have little water, and must be kept warm; but in fummer they should have fresh air, and be frequently sprinkled all over with water. They will flower about the fourth year from the seeds.

The falfifolia and falviforia may be propagated by cuttings on an old hot-bed in July, covered with a bell glas, and shaded from the sun. In a month they may be planted in pots and, when the roots have taken fresh root, should be removed to a sheltered situation till the winter, when they must be preferred in the conservatory, or dry flove. The faloebus will flower well, and live through a mild winter out of doors in a warm fiftomer bed.

BUDDLING of calamine, denotes the operation of cleaning it from fift, by washing and picking it, preparatory to the baking it in the oven. Phil. Tranf. N° 198, p. 675. See CALAMINE.

BUDDLING-dish, a small, shallow vefsel, like the bacons of a pair of fcales, for the washing of ores of metals by the hand.

BUDDRA, in Geography, a river of the peninsula of India, which rives in the Myfone country, and joining the Toor near the county of Hooiy-Onore forms the Toombuddra river.

BUDDRINANT, or BADRENAUT, a town of Thibet, on the e aft fide of the river Alkumundes, or Alkundurra. N. lat. 32°, E. long. 80° 20′.

BUDDS VALLEY, a place in the county of Morris, in New Jersey, in America, foitate on the head waters of Rariton.

BUDEE river and bay, lie on the north coast of Cornwall, about S.S.W. and S. E. from Harland point, on the coast of Devonshire.

BUDA, or BUDAPEST, in Ancient Geography, a town of Magnesia. It was one of the appellations given to Minerva.

BUDILL (Ridgler), in Zoology, the water-dog: (Canis) variety aquatilis.

BUDILICH, in Geography, a town of Germany, in the circle of the Lower Rhine, and electorate of Treves; or by the French arrangement, in the department of the Sarre, and chief place of a canton, in the district of Treves, 11 miles E. of Treves; the town contains 195, and the canton 6506 inhabitants; and the territory comprises 24 communes, N. lat. 49° 52'. E. long. 6° 55'.

BUDELICH. See Bildich.

BUDESHEIM, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz; one mile E. of Bingen.

BUDETIN, a town of Hungary; 16 miles E. N. E. of Bolesko.

BUDGE, in Law. See Dupehe of court.

Budge-barrels, are small barrels well hooped, with only one head, the other end having nailed on it a piece of leather, to draw together upon firings, like a purse.

Budge-barrels are used for carrying powder along with a gun or mortar; as being least dangerous, and also rather than whole barrels. They are also used upon batteries of mortars, for holding meal-powder.

BUDGELL, Eustace, in Biography, the relation and friend of Addison, and an ingenious writer, was the son of Gilbert Budgell, D. D., of St. Thomas near Epsom, and was born about the year 1665. He was educated as a gentleman commoner at Christchurch College, Oxford, and afterwards entered at the Inner Temple, London, with a view to the profusion of the law. But an inclination to pleasure, and also to polite literature, diverted his attention from studies appropriate to the bar; and in 1706, he accompanied Addison to Ireland, as one of his clerks. By associating with persons of taste and fashion, and cultivating an acquaintance with the best writers, ancient and modern, he acquired the accomplishments of the gentleman and scholar. But though he was distinguished by a lively imagination, tenacious memory, pungent addressing, and graceful elocution, his unconformable vanity depreciated his other talents, and became a prominent feature of his character through life. His first exhibition as an author was in the Spectator; and the papers marked X in the first seven volumes are attributed to him. Of the eighth volume, it is said to have been wholly conducted by Addison and Budgell. Dr. Johnson, however, says that his papers were either written by Addison, or too much improved by him, as to be rendered in a manner his own; and, it is observed, that their style resemble that of Addison. The humorous and admired epigrams to the Dilated Mother, usually ascribed to Budgell, is also said to have been the composition of Addison. About this time, Budgell wrote several epigrams and songs, which, together with Addison’s fineacre letter to him, recommended him to general notice and esteem. But, notwithstanding his literary connections and engagements, and his accession to a family estate, encumbered indeed with debts, of about £500, a year, he was unremitting in his attention to the duties of his office. In the preface to the Guardian, he is represented as having a concern in that work, in connection with Addison and for Richard Steele; but his papers are not now discriminated. In 1714, he published a translation from the Greek, of “The Characters of Theophrastus,” which was commended by Addison, and which appears to have been executed with ingenuity and elegance. In this year, he was advanced to the offices of under secretary to the lord lieutenant, chief secretary to the lords judges of Ireland, and deputy clerk of the council in that kingdom. To which was added the honour of a seat in the Irish parliament, where he distinguished himself as a speaker. When the rebellion broke out in 1715, he was entangled with the charge of transporting troops to Scotland, which he executed in a manner equally safe and disinterested. In the beginning of the year 1717, when Addison became secretary of state, he was promoted, under his patronage, to the office of accomptant, and comptroller general of Ireland. But this tide of prosperity took an unfavourable turn soon after this latter appointment, when the duke of Bolton was appointed to the vice-royalty. When the duke’s secretary insisted on quartering upon him a friend, his indignation was at once; and he attacked both the secretary and the lord lieutenant in a virulent lampoon, which he published against the advice and remonstrance of Addison, and which caused him to be deprived of his place as comptant. Upon his return to England, he determined, in opposition to the counsel of his best friends, to publish his book, and, by this second act of indiscipline, he increased the resentment of his enemies. By a popular pamphlet written in 1719 against the famous peacogue bill, he incensed the earl of Sunderland and, at this time, the death of Addison, his steady friend and faithful counsellor, terminated all his expectations from the court. His circumstances, however, were easy and affluent, and he might have lived with dignity and independence. But seduced by the inflation of the fatal year 1720, he embarked in the South Sea scheme, and lost 26,000l. Having taken an active part in the concerns and debates of the company, and published pamphlets on the occasion, that were well received, he attracted the notice of the duke of Portland, who had been a sufferer in this bubble as well as himself: and he was taken under his special patronage, with the promise of accompanying him as his secretary to Jamaica, of which island he was appointed governor. But the impracticable remittance of the court frustrated his expectations, for the duke was expressly forbidden to take him out as his secretary. This cruel treatment irritated his temper; and with a view of giving importance to his opposition, he spent nearly 5,000l. in various unsuccessful efforts for obtaining a seat in parliament; and he was aided by the duchess of Marlborough in 1727 with the sum of 1200l. for this purpose. His attempts failed; his affairs of course became deranged; and he involved himself in a variety of quarrels and law-suits, which entailed upon him disreputable disgrace and embittered the close of his life. In 1732, he published an historical work, entitled “Memoirs of the Life and Character of the late Earl of Orrery, and of the Family of the Boyles,” which, whatever valuable information it may contain, does not bear the character of impartiality. It is needless to mention his other publications, which, though well received, are now forgotten, or to add that he contributed several papers to the “Crafficman,” and that he established a weekly pamphlet called the “Bee,” which had no long duration. His reputation was sunk very low; and a circumstance occurred which totally ruined it. On the death of Dr. Matthew Tindal, the author of “Christianity as old as the Creation,” in the publication of which he was thought to have had some concern; a bequest to Budgell of 200l. appeared in his will. This legacy, so disproportionate to Tindall’s circumstances, so injurious to his nephew, the Rev. Nicholas Tindall, the translator of Rapin, and so contrary to his known
known intentions and conduct, surprized those who heard of it, and excited a suspicion of unfair dealing, very reproachful to Budgell. The will was contested and set aside. To this transfaction, Pope, who has introduced Budgell into the Dunciad, and satirized him in several parts of his works, evidently alludes in one of his epistles:

"Let Budgell change low Grub Street on my quill,
And write whate'er he pleaseth except my will."

At length, this unfortunate man, unable to struggle any longer with his embarrassed circumstances and indelible disgrace, adopted the resolution, strengthened by the pride of his temper, and his disbelief of revelation, to put an end to his life; and, on May 4th, 1737, he took a boat at Somerset Flats, and having ordered the waterman to float the bridge, he threw himself overboard, with stones in his pockets, and immediately sunk. He had previously attempted to procure a natural daughter to share his fate; but the, preferring a continued life to this shocking mode of terminating it, became afterwards an actor at Drury Lane theatre. On the bureau of Budgell was found a slip of paper, on which were written these words:

"What Cato did, and Addison approved,
Cannot be wrong."

But this charge against Addison is wholly groundless; for he attempted to obviate the ill effects that might be supposed to arise from Cato's example by a dying disapprobation of his own conduct. Biog. Brit.

transmigration, from the lowest rate of an insect, through the various species of living animals. There have been three deeds of this name, each of which is supposed to reign as long as a bird removes a hill of sand, half a mile high, and six miles round, by a single grain in a thousand years. See So owner; see also Boodh.

BUDWEIS, or Budegowice, in Geography, a royal and well fortified city of Bohemia, in the circle of Bcehin, seated on the river Moldaw, enjoying the sheep-lands of salt, and having in its vicinity mines of gold and silver; and, as it is said, pearls, which are fished for in the river Moldaw. It was erected into a bishopric by the emperor, in 1787. The king of Prussia laid siege to it with 8000 men, under general Nassau in 1774, and took it; but did not long retain it; 66 miles S. of Prague. N. lat. 43° 15'. E. long. 14° 19'.

BUDWIZ, a town of Moravia, in the circle of Znayn; 84 miles S. E. of Prague.

BUDZADGIH, a town of Asiatic Turkey, in the province of Natalia; 40 miles N. E. of Ilnick.

BUDZIAC Tartary. See Bessarabia.

BUDZIENICE, or Budzenico, a town of Lithuania, in the palatinate of Minsk; 56 miles W. of Rohaczow. N. lat. 53° 30'. E. long. 28° 20'.

BUECH, a town of France, which runs into the Durance, near Silletron, in the department of the Lower Alps.

BUEIB, a town or village of Egypt, called the "Straits," seated on a mountain in the road of the pilgrims; 30 miles N. E. of Cairo.

BUEIB, called the "Narrows," a town or village of Upper Egypt, seated on the west side of the Nile; 32 miles S. E. of Aafa or Efbel.

BUELA, a town of Persia, in the province of Koraffan; about 313 miles N. W. of Herat. N. lat. 37° 40'. E. long. 57° 2'.

BUENOS AIRES, so called on account of the peculiar fulness of its climate, a Spanish territory or vice-royalty of South America, established as such in 1776, is reckoned by Ulloa the fifth bishopric belonging to the archdeacon of Charcas. This name comprehends the whole country from the eastern and southern coast of that part of America, to Cordova and Tucuman on the west, to Paraguay on the north, and on the south to the sea and the Terra Magellonica or Patagonia, the vertex of that triangular point of land which forms South America. This country is watered by the great river La Plata, first discovered in 1515, by Juan Diaz de Solis, who, with his two attendants, was massacred by the natives; and partly subdued, in 1526, by Sebastian Gabot. Buenos Aires abounds with horned cattle and wild horses, which find a shelter from the heat of the sun, and an ample supply of food in the immense plain, called by the Spaniards "Pampas," which commences about 20 miles from the capital, and extends 100 miles westward to the foot of the mountains, and about 500 miles southward towards Chili. This plain is wholly covered with very high grass, and is for the most part uninhabited and defitute of trees. From the travels of Helms we learn, that the largest tamed ox is sold for one piastre, or about 36. 6d., and that a good horse may be purchased for two piastres. The hides of these animals constitute a principal article of trade in this country. The rivers and sea supply all kinds of fish; the country abounds with game; and fruits of every quarter of the globe grow here in the utmost perfection; so that with regard to the fulness of the air and the various enjoyments of life, a finer country cannot be imagined. Although the climate is healthy and pleasant, there is a great difference in the seasons. In the summer the air is serene, and the exceutive heat of the sun is moderated by breezes which blow every morning. In the winter storms often occur, with rain and dreadful lightning and thunder. The capital of this country is Buenos Ayres, and within its government are three other cities, viz. Santa Fe, Las Corrientes, and Monte-video.

BUENOS AIRES, Nuestra Senora de, the capital of the country of the same name, and of the kingdom of La Plata, was founded by Don Pedro de Mendoza in 1535, who was at that time governor, on a spot called Cape Blanco, on the south side of Rio de la Plata, adjoining to a small river; from which the plain on which it stands, ascends gently. Soon after its first establishment, it was abandoned; but rebuilt in 1582, and erected into a bishopric in 1620. It is said to contain about 4000 houses, and from 24 to 30 thousand inhabitants, who are chiefly Spaniards and native Americans. It is well fortified and defended by a numerous artillery. Although the breadth of the city, like many towns situated on rivers, is not proportioned to its length, its streets are straight and of a proper width. The principal square is very large, and built near the small river; and in the front of it is a castle, where the governor customarily resides. The houses, which were formerly constructed with mud-walls, thatched with straw, and very low, are now much improved; some being built with chalk, and others with brick, most of them tiled, and having one story besides the ground floor. The cathedral, which is the parish church for the greater number of the inhabitants, is a spacious and elegant structure; and the chapter is composed of the bishop, dean, archdeacon, and two canons. At the farther end of the city is another archway appropriated to the Indians. Here are also several convents, and a royal chapel in the castle where the governor resides. This is the great resort of the merchants of Europe and Peru, who travel the country from hence by Cordova and Tucuman to Poto; and for the accommodation of travellers there is an uninterrupted post-road, with post-horses and proper relays of horses and carriages across the continent to Peru. In the spring the whole intercourse with Europe being carried on by 2 or 3 regilier ships. The returns are chiefly gold and silver of Chili and Peru, sugar, and hides. The contraband trade, however, has been found the most advantageous; and this has been principally carried on by the Portuguese, who keep magazines for that purpose in those parts of Brazil which lie nearest to this country. The most valuable commodities are brought here to be exchanged for European goods, such as the Vicuna wool from Peru, copper from Coquimbo, gold from Chili, and silver from Poto. From Corrientes and Paraguay are conveyed hither tobacco, sugar, cotton, thread, yellow wax, and cotton cloth; and from Paraguay, the herb so called and so highly valued for tea, which is drank every where in South America by the higher classes, and which supplies a branch of trade, amounting, as it is said, to a million of pieces of eight annually, wholly paid in goods, as no money is allowed to pass here. The commerce between Peru and Buenos Ayres is chiefly for cattle and mules, to an inmemorial value. This city is situated about 77 leagues from Cape Santa Maria, which lies on the north coast near the entrance of the river de la Plata; and its little river not having water sufficient for ships of burden to come up to it, they anchor in one of the two bays on the same coast. That farthest to the eastward is called Maldo- nado, 9 leagues from the above cape, and the other named Monte-video from a mountain near it, and distant 20 leagues from the said cape. The navigation to the city is dangerous.
BUFFALOE, a lake of North America, situated near Copper-mine river, in the country of the Copper Indians. N. lat. 66°.—Also a lake of North America, which receives the Beaver river, about 25 miles long, and from 2 to 10 wide. N. lat. 55° 55'. W. long. 109° 55'.

BUFFALOE Lick. See Great Ridge.

BUFFALOE Loealnda, a tract of land, in Northumberland county, Pennsylvania, about 88 miles S. E. from Presque Ile.

BUFFALO'S Bay, lies within the point of the cape of Good Hope, across which from point to point is a ledge of rocks continuing northward to the south point of the entrance into Simon's bay, on the west side of False bay.

BUFFALO'S Point, lies above Rongafoula river, on the approach to Hugly river in Bengal, about half way in the right between Jefore and Culpe rivers. Ships stop here which do not venture higher up into the Hugly river.

BUFFAROLO, a town of Italy, in the Milanci; 17 miles W. of Milan.

BUFFEL, Buffelus, Buffel. See Dos Bubales.

BUFFET, or Beauget, was an anciently a small apartment or cell, separated from the rest of the room by means of slender wooden pillars, in which were deposited china, glassware, &c. It was sometimes called a cabinet. The term has since been sometimes applied to a large table, more usually called a "side-board," furnished with drawers, and serving either for convenience or show, to receive plate, bottles, vases, glasses, &c. In France, among persons of distinction, the buffet is a detached room, decorated with pictures, exhibiting fountains, cisterns, and vases, and commonly faced with marble or bronze. Among the Italians, the buffet, called "credenza," is inclosed within a buffet-case as high as the elbow.

BUFFETTO, in Geography, a town of Switzerland, in the Valteline, seated on the north side of the river Adda. N. lat. 46° 5' E. long. 9° 50'.

BUFFIER, Claude, in Biography, an ingenious writer, was born of French parents, in Poland, in 1661, and educated at Rouen. He entered among the Jesuits at Paris in 1679, and afterwards fixed his residence at the college of the Jesuits in that city. Besides his engagements with the compilers of the Memoirs de Trevoux, he wrote a great variety of works, some of which have been much esteemed. But his most celebrated performance is his "Traité de premiers Verités, &c.," or treatise of first truths, and of the sources of our judgments; in which the opinions of philosophers on the first notions of things are examined; Paris, 1724, 12mo. The principles of this work are the same with those adopted and expanded in the writings of Drs. Reid, Ofwald, and Beattie, under the denomination of Common Sense. His "Elements of Metaphysics, made intelligible to all Readers," 1735, 12mo. is a work formed upon the same plan. He was also the author of a "French Grammar upon a new Plan," which was well received. His principal works have been collected and published under the title of "Cours des Sciences, fur des Principes nouveaux et simples, &c.," or a course of sciences on new and simple principles, for the purpose of forming the language, the understanding, and the heart, in the ordinary commerce of life, 1732, fol. This laborious and useful writer died in 1737. Nouv. Dict. Hift.

BUFFELS, or Buff, in Geography, an island of Africa, on the south coast of Benin, in the mouth of the river Camarons, or Camonars.

BUFFON, George-Louis Le Clerc, Comte de, in Biography, an eminent naturalist and writer, was the son of a counsellor of the parliament of Dijon, and born at Montbardin Bur-
BUFF

On this day, September the 7th, 1707. He manifested an early inclination to the sciences, which diverted him from pursuing the profession of law, to which his first studies at Dijon were devoted, and for which his father had designed him. The science which seems to have engaged his earliest attachment was astronomy; with a view to which he applied with such ardour to the study of geometry, that he always carried in his pocket the elements of Euclid. At the age of 20, he travelled into Italy, and in the course of his tour he directed his attention to the phenomena of nature more than to the productions of art; and at this early period he was also ambitious of acquiring the art of writing with ease and elegance. In 1728 he succeeded to the estate of his mother, estimated at about 12,000l. a year, which, by rendering his circumstances affluent and independent, enabled him to indulge his taste in those scientific researches and literary pursuits, to which his future life was devoted. Having concluded his travels, at the age of 25, with a journey to England, he afterwards resided partly at Paris, where, in 1739, he was appointed Superintendent of the royal garden and cabinet, and partly on his estate at Montbard. Although he was fond of society, and by no means insensible to the attractions of the fair sex, he was indefatigable in his application, and is said to have employed 14 hours every day in study. We learn from the biographical anecdotes relating to him, collected by Herculane de Sechelles, and published in Petiti's "Paris, pendant l'Année 1795; et l'Année 1796," that he would sometimes return from the supper at Paris at two in the morning, when he was young, and order a boy to call him at five; and if he lingered in bed, to drag him out on the floor. At this early hour it was his custom, at Montbard, to dress, powder, dictate letters, and regulate his domestic concerns. At five he retired to his study, which was a pavilion called the tower of St. Louis, about a furlong from the house, at the extremity of the garden, and which was accommodated only with an ordinary wooden desk and an arm chair. Within this was another sanctuary, denominated by prince Henry of Prussia "the Cradle of Natural History," in which he was accustomed to compose. On this retreat no one was suffered to intrude. At nine his breakfast, which consisted of two glasses of wine and a bit of bread, was brought to his study; and after breakfast he wrote for about two hours, and then returned to his house. At dinner he indulged himself in all the gaieties and trifles which occurred at table, and in a freedom of conversation, which obliged the ladies to withdraw. When dinner was finished, he paid little attention either to his family or guests; but having slept about an hour in his room, he took a solitary walk, and then he would either converse with his friends or sit at his desk, examining papers that were submitted to his judgment. This kind of life he pursued for 50 years; and to one who expressed his astonishment at his great reputation, he replied, "Have not I spent fifty years at my desk?" At nine he retired to bed. In this course he prolonged his life, notwithstanding excruciating sufferings occasioned by the gravel and stone, which bore with singular fortitude and patience, to his 81st year; and retained his senses till within a few hours of his dissolution, which happened on the 16th of April, 1788. His body was embalmed, and presented first at St. Médard's church, and afterwards conveyed to Montbard, where he had given orders in his will to be interred in the same vault with his wife. His funeral was attended by a great concourse of academicians, and persons of rank and literary distinction, and a crowd of at least 20,000 spectators assembled in the streets through which the hearse was to pass. When his body was opened, 57 flutes were found in his bladder, some of which were a large as a small bean; and of these 37 were crystallized in a triangular form, weighing altogether 2 ounces and 6 drams. All his other parts were perfectly found; his brain was found to be larger than the ordinary size; and it was the opinion of the gentlemen of the faculty who examined the body, that the operation of lithotomy might have been performed without the least danger; but to this mode of relief M. Buffon had invincible objections. He left one son, who fell a victim to the atrocities under Robespierre. This son had erected a monument to his father in the gardens of Montbard; which consisted of a simple column, with this inscription:

"Excellens turris humilis columna Parenti suo filius Buffon, 1785."

The father, upon seeing this monument, burst into tears, and said to the young man, "Son, this will do you honour."

Buffon was a member of the French Academy, and perpetual treasurer of the Academy of Sciences. With a view to the preservation of his tranquility, he wisely avoided the intrigues and parties that disgracefully occupied most of the French literati in his time; nor did he ever reply to the attacks that were made upon his works. In 1771 his estate was erected into a comte; and thus the decoration of rank, to which he was by no means indifferent, was annexed to the superior dignity he had acquired as one of the most distinguished members of the republic of letters.

Before we give an account of his works, we shall mention a few particulars relating to his person and character. His figure was noble and manly, and his countenance, even in advanced age, and notwithstanding excruciating pains, which deprived him of sleep sometimes for 16 successive nights, was calm and placid, and exhibited traces of singular intelligence. Vanity, however, which seemed to have been his predominant passion, extended even to his person and to all its exterior ornaments. He was particularly fond of having his hair neatly dressed, and for this purpose he employed the friseur, in old age, twice or thrice a day. To his dress he was peculiarly attentive; and took pleasure in appearing on Sundays before the peanerty of Montbard in laced clothes. At table he indulged in indecencies and licentious pleasantry, and he was fond of hearing every goffeping tale which his attendants could relate. In his general intercourse with females he was as lax and unguarded as in his conversation. During the life of his wife, he was chargeable with frequent infidelities; and he proceeded to the very unwarrantable extreme of debauching young women, and even of employing means to procure abortion. His confidence, in the latter period of his life, was almost wholly engrossed by mademoiselle Bleflein, who lived with him for many years. His vanity betrayed itself on a variety of occasions in relation to his literary performances. These were often the subjects of his discourse, and even of his commendation. When he was recommending the perusal of capital works in every department of taste and science, he added, with singular pretension and self-confidence; "Capital works are scarce; I know but five great geniuses—Newton, Bacon, Leibnitz, Montesquieu, and myself." He was in the habit of reciting to those who visited him whole pages of his compositions, for he seemed to know them almost all by heart; but notwithstanding his vanity, he listened to objections, entered into a discussion of them, and far exceeded his own opinion to that of others, when his judgment was convinced. He expressed himself with the utmost respect and the pleasures accruing from study; and he declared his preference of the writings to the conversations of learned men, which almost always disappointed him; and therefore he voluntarily secluded himself from society with such, and in company was fond of trifling. He maintained, however, an extensive correspondence with several

Vol. V.
several persons of rank and eminence; and particularly with prince Henry of Prussia, and with the late emperors of Russia, who ably criticized some of his opinions, and favored with great zeal in her dominions his researches in natural history. Of his literary vanity he gave evidence early towards the close of life; alleging that he feared not death, and that the hope of immortal renown was the most powerful of death-bed confessions. He took great pains in forming the style of his writings; and as composition was to him a difficult task, he repeatedly revised his works before he published them. Such was his attention to style, that he could not bear the least deviation from accuracy and propriety in the use of language.

"The style," said he, "is the man; our poets have no style; they are coerced by the rules of metre, which makes flavour of them." To this circumstance it was owing that he abandoned poetry which he attempted in his youth, and restricted himself to prose. "Two things," says he, "form style, invention and expression. Invention depends on patience; contemplate your subject long; it will gradually unroll and unfold—till a sort of electric spark convulses for a moment the brain, and spreads down to the very heart a glow of irritation. Then are come the luxuries of genius, the true hours for production and composition—hours so delightful, that I have spent 12 and 14 successively at my writing-desk, and still been in a state of pleasure. It is for this gratification, yet more than for glory, that I have toiled. Glory comes if it can, and mostly does come. This pleasure is greater if you consult no books; I have never consulted authors, till I had nothing left to lay off my own." Such was his regard to fame, that he destroyed every paper which he thought useless or unfinished; and thus preferred his reputation from being malfeaced by posthumous publications.

Of the free sentiments which he had imbibed with regard to religion, his works afford ample evidence. They sufficiently indicate his attachment to the system of materialism. "Religion," said he to one who was reading to him verses on the immortality of the soul, "would be a noble pretext, if all that were true." Notwithstanding the licentiousness of his religious opinions, as well as of his moral conduct, he conformed to the external ritual of religion, adding, as some will say, hypocrisy to his impurity; when he was at Montbard, he received the annual communion in his seigniorial chapel, attended high masses every Sunday, and distributed a louis weekly among different descriptions of pious beggars. "There must," he said, "be a religion for the multitude; and we should avoid giving offence." "I have always," he added, in conversation with a friend, "named the Creator; but it is only putting, mentally, in its place, the energy of nature, which results from the two great laws of attraction and impulse. When the Sorbonne plagued me, I gave all the satisfaction which they solicited; it was a form which I despised, but men are fally enough to be satisfied. For the same reason, when I fall dangerously ill, I shall not hesitate to fend for the sacraments. This is due to the public religion. Those who act otherwise are madmen." Thus, as he boasted, he avoided scoring the mischievous attacks which Voltaire, Diderot, Helvetius, and others had made upon religion, whilst, by the avowal of such licentious sentiments in conversation, and by the opinions circulated in his writings, he was perpetually lapping its foundations, and counteracting every obligation of truth and integrity. But let us direct our attention from the principles and character of Buffon, which have been sufficiently developed, and which no reflecting person can contemplate without disgust, to his works. In this view of him he appears with much greater advantage. His first publication was a translation from the English of "Hales's Vegetable Statics," in 1735; which was followed in 1740 by a translation from the Latin of "Newton's Fluxions." His "Theory of the Earth" was first published in 1744, which was included in his most comprehensive and celebrated work entitled "Natural History, general and particular," which commenced in 1749, and at its completion in 1762, extended to 15 vols. 4to, or 31 vols. 12mo. Supplements were afterwards added, amounting to several more volumes. In the anatomical part the author was aided by M. d'Aubenton; but in all the other parts Buffon himself displays his learning, genius, and eloquence, and he also indulges his fancy, in exploring and delineating the whole economy of nature. He begins with a theory of the earth, which, as well as the other planets, he supposed to have been originally a mass of liquefied matter, dashed out of the body of the sun by the violent siege of a comet. He then covers it with ocean, from which he forms istra by deposition, and mountains by the flux and reflux of the tide. Subterraneous fires, eruptions, and earthquakes, produce other changes; and the world we now inhabit is but the ruins of a former world. For a more particular account and examination of his theory, see Earth and Planets. In his account of the population of the earth with living creatures, he investigates the analogies between vegetable and animal life; and in explaining the mystery of animal generation, he allows ample range to his imagination in a variety of hypotheses and conjectures. He conceives certain "living organic molecules," of the same nature with organized beings, to exist equally in animal and vegetable matter; and, in the processes of nutrition, to be received into "internal moulds," of which animal and vegetable bodies are formed, where they are assimilated into the same substance as the parts to which they are transmitted, and thus nourish them. When this nutritive matter superabounds, it is detached from all parts of the body, and deposited in a fluid form in one or more reservoirs. This constitutes a prolific matter, which is ready for producing a new animal or vegetable, of the same species, when it meets with a proper matrix. The supposed seminal animalculae are only these organic particles, which are similar in both sexes, but must unite in order to produce a new animal by the processes of generation. See Generation. Buffon's natural history of animals commences with that of man; whom he traces from the cradle to the grave, through the development and maturation of his bodily organs and mental powers, the nature and operation of his senses, and the several varieties of his species, introducing and intermixing in the research many curious disquisitions. He then investigates and unfolds the nature of brute animals in general; and marks the distinction between them and men, by denying them a soul, and a memory, properly so called, and making all their actions to spring from external impressions. The class of quadrupeds occupies the whole remainder of this first work. To his history of quadrupeds he added, in 1776, a supplementary volume, which, besides an ingenious dissection on mules, contains the history and figures of several new animals, and valuable additions to most of those described in the original publication. Disdaining the arrangements of systematic naturalists, he has rejected all the received principles of classification, and has thrown his subjects into groups, laxly formed from general points of resemblance. Not content with deviating from established modes of distribution, he ridicules the authors of systematic arrangements, and particularly the late ingenious and indefatigable Linnaeus, whose zeal and labours in investigating and clasping natural objects entitle him to the highest applause. It is hardly necessary to remark, that he has adapted his style to the particular subjects of his discussion. While the mere enumeration of facts, or descriptions of the figure, dimensions, and colour of animals,
BUFFON.

mals, admit of no other ornament than that of pernicuity; topics of philosophy and argument require a higher and more figurative expression; and address to the passions and finer feelings of men, allow full scope to the exercise of genius and of taste. Of these different species of writing, the works of Buffon afford numerous examples. It has been observed, however, that his style occasionally rises above the level of his subject; and this is particularly the case, when he is painting in glowing colours the manners and habits of the lion, the hare, the elephant, and others of his favourite subjects. By the indulgence of this passion for high painting, he has been betrayed into a deviation from the limits of simple truth, and has been led to wander into the regions of fancy. In particular and minute observation he excels, and by his indefatigable researches, he has added a very copious addition to the treasure of authenticated facts. In some cases he has been milled by an undue attachment to theory, as well as by the ambition of disfiguring eloquence. "On various topics," says a judicious biographer, "he had formed general theorems, which he was inclined to support against exceptions by denying or neglecting the instances produced on the other side. Further, he not unfrequently gives the mere inferences from his opinions as if they were known and tried facts, thus dangerously confounding hypothesis with that experience which is the only true basis of all natural knowledge. He often attributes more to the operation of certain causes, such as change of climate, domestication, and the like, than sober reason can warrant; and, even, according to the tenor of his argument, sometimes ascribes opposite effects to the very same cause. These blemishes materially leaven the confidence with which his work can be used as authority, and later inquirers are continually detecting errors in his statements. Yet the great masts of matter will probably always remain unimpeached; and certainly no writer has ever done so much to render natural history entertaining, and to elevate its rank among the objects on which the human intellect is employed. In one point, however, he will by many be thought to have derogated from the true dignity and value of his subject. He is everywhere the enemy of the doctrine of final causes, and substitutes, to a designing and benevolent author, the fortuitous operations of a certain unconscious "Nature," which as often exhibits examples of blunder and defect, as of skilful and happy contrivance." "Studiously to overlook to be beautiful a part of the economy of things, as the adaptation of means to ends, is surely as inconsistent with the philosophical as the religious spirit," which may, possibly, in some instances, have betrayed him into error. This "fault is aggravated in Buffon by the pleasure he occasionally takes in declaiming upon the defects of nature, in a strain which would seem to impute malignity of intention to the Author of being, and which he appears to have derived from the shallow philosophy of his predecessor, Pliny. The moral reader of Buffon will likewise he frequently offended with the grossnafs of his descriptions in all points relative to sex: in which he not only indulges in an anatomical plenitude of language, but, what is much worse, adopts a studied feminallin, the object of which is to exalt the value of sexual gratifications, and make a propensity to them one of the indications of nobleness of nature."

After the completion of his history of quadrupeds in 1767, Buffon was interrupted in the progress of his labours by a severe and tedious indisposition; and therefore the two first volumes of his "History of Birds" did not appear till the year 1771. In the composition of the greatest part of these he was indebted to the labours of M. Gueneau de Montbel-

lard, who adhered so closely to Buffon's mode of thinking and of expression, that the public could not perceive any difference. The four subsequent volumes were the joint production of both writers; and each author prefixed his name to his own articles. The three remaining volumes were written by Buffon himself, with the assistance of the abbe Berton, who formed the nomenclature, drew up most of the descriptions, and communicated several important hints. The work was completed in 1783, but on account of the much greater number of species of birds than of quadrupeds, the want of systematic arrangement is more to be regretted in this than in the other history. A translation of Buffon's "Natural History," by Mr. Smellie of Edinburgh, completed in 8 vols. 8vo. was published in 1781, to which a 9th volume was added in 1786, containing a translation of a supplementary volume of Buffon, and confuting chiefly of curious and interesting facts with regard to the history of the earth. The translator has omitted the anatomical dissections and menurations of M. D'Aubenton, which greatly enhanced the bulk, as well as the price of the original, and which the author himself had omitted in the last Paris edition of his performance. There are likewise some other omissions, which are not very important; respecting the method of studying natural history, methodical distributions, and the mode of describing animals. These omissions have been amply compensated by the translator's addition of short distinctive descriptions to each species of quadrupeds, of the figures of several new animals, and of the synonyma, as well as the generic and specific characters given by Linnæus, Klein, Buffon, and other naturalists, together with occasional notes. A translation of Buffon's "History of Birds," in 9 vols. 8vo. with notes and additions, was also published by Mr. Smellie in 1793.

In 1774, Buffon began to publish a "Supplement" to his "Natural History," constituting the "History of Minerals." The first volume contains an account of his burning glass, for which, see that article. These supplemental volumes, of which the 5th, in 4to, appeared in 1778, contain many curious and valuable experiments, as well as much theory; too lax for the rigour of modern science. The concluding volume may be considered as a kind of philosophical romance. It comprehends what the author fancifully denominates the "Epochas of Nature," or those great changes in the state of the earth which he supposes to have successively resulted from his hypothesis of its original formation out of the sun. Of these epochas he enumerates seven, of which six are supposed to have been previous to the creation of man. In the description of these epochas, as to both their causes and effects, the author has indulged the spirit of fancy, and formed a sort of fairy tale, which he has contrived to render amusing and instructive. Such as we have recounted are the principal works of this great author, which have been collected and published in 35 vols. 4to. and 62 vols. 12mo.; and of the whole or parts of which new editions occasionally appear. After he had completed his "History of Minerals," he had formed a design of composing the "History of Vegetables:" but this project was defeated by his death. Several of the subjects that occur in his "Natural History," and its supplements, have been discussed in separate memoirs, and may be found in the Memoirs of the Royal Academy of Sciences at Paris, for the years 1737, 1738, 1739, 1741, and 1742. Some account of them will be found in different articles of this dictionary. See particularly Accidental Colours, Heat, Magnetism, Timbre, &c. Nouv. Dict. Hilt. Encyclopédie Phylique, tom. i. Lett. de Herztul Sechelles, ubi supra. Smellie's Translations. Gen. Biog. 

BUFFONI, in Ornithology, a species of Falco, called by Latham
Latham the Cayenne ring-tail, as being an inhabitant of that part of the world. It is specifically distinguished, by having the core blue; legs yellow; body about dark brown, beneath reddish-buff; eye-brown yellow; tail faciated with pale, and dullly brown, Gmel. &c. Length of this bird two feet.

BUFFON, a droll, or mimic, who diverts the public by his puerilities and follies. Mem. after Salmasius, derives the word from bufio; a name given to those who appeared on the Roman theatre with their checks blown up; that, receiving blows thereon, they might make the greater noise, and fat the people a laughing. Others, as Rhodius, make the origin of buffoonery more venerable; deriving it from a feast instituted in Attica, by K. Erichthius, called BUPHONIA.

BUFFOONs are the name with what we otherwise find denominated fucers, gelasini, nimboleti, minifleti, guliardi, juculatores, &c. whose chief scene is laid at the tables of great men. Gallinus never sat down to meat without a second table of buffoons by him. Tillemon also renders FANTOMINES by buffoons; in which fucis he observes, the flowers of their buffoons were taken away by Domitian, restored by Nero, and finally abolished by Trajan. Crevier's Hist. of the Emperors, vol. vii. p. 45.

BUFFY COAT, or size of the blood, in Medic. See Blood, appearances of.

BUFFO, in Entomology, a species of Bombyx, that inhabits Germany. The wings are yellowish, with a broad brown band, and yellow spots. Fabr.

BUFFO, a species of CURCULIO, that inhabits Siberia. The colour is yellowous; wing-cases slightly reticulated, with a white stripe in the middle. Fabr.

BUFFO, in Zoology, the specific name of the common toad, rana bufo of Linneus, and other Latin writers. Gmelin adopts the concise description of the Linnaean Fauna suaves, "corpori lirido fulvoque," for this species. But, besides the body of the toad being lirid and fuscous, the back is marked with tubercles, which ought likewise to be distinctly noticed in its specific character. The description given of it by Roevel it is not amiss, "Bufo terrestris, dorso tuberculis exasperato, oculis rubris." Hiët. Rana.

Authors make three or four varieties of the common toad. The var. Arabs of Gmelin, is Bufo calamita of Laurentii; the back of this kind is olivaceous with an unequal, clear, yellowish-red, band down each side. 7, another variety, Laurentii describes under the name of Bufo viridis, the body being marked with confluent green spots, and warts; those warts which rise within the area of the green spots are of the same colour, while the rest, which are situated in the spaces between them, are red, upon a bicolloured ground. 8. Bufo olidriticae of Laurentii is distinguished by being of a smaller size than either of the preceding. In Act. Paris. 1741, this last variety is described under the title of Bufo terrestris minor. Independently of which, may be considered as permanent varieties of the common toad, it should be observed, that different individuals exhibit a great diversity in their general colours, markings, the size of the dorsal tubercles, and other particulars. The olivaceous hues with darker variations prevail most commonly. In the early part of summer they are sometimes found with the shoulders and limbs marked with reddish spots, and the under parts of the limbs and body tinged with yellow.

The toad, lays an ingenious writer, is the most deformed and hideous of all animals: the body is broad, the back flat, and covered with a pimply dulky hide, the belly large, swelling, and swelling out, the legs short, and its pace laborious and crawling; its retreat gloomy and filthy: in short, its general appearance is such as to strike one with disgust and horror. Yet it is said by those who have resolution to view it with attention, that its eyes are fine; to this it occurs that Shakespeare alludes, when he makes his Juliet remark, "Some say the lark and boated toad change eyes," as if they would have been better bestowed on so charming a fagonier, than on this ravenous animal. Pennant. The eyes are uncommonly beautiful, being surrounded by a reddish gold coloured iris, and the pupil, when in a state of contraction, appearing transverse.

Rana bufo and its varieties appear to be confined exclusively to the European continent. It inhabits woods, gardens, fields, and damp shady places, and frequently makes its way into cellars, or any obscure recesses in which it may occasionally conceal itself; and where it may find a supply of food, or a security from too great a degree of cold. In the early part of spring, like others of this genus, it retires to the waters, where it continues during the breeding season, and deposits its ova or spawn in the form of double necklace-like chains or frings, of beautifully transparent glutton, and of the length of three or four feet, in each of which are disposed the ova in a continued double series throughout the whole length, having the appearance of too many small jet-black globules or beads. These globules are, in reality, no other than the tadpoles, or large convolutions into a globular form, and waiting for the period of their evolution, or hatching, which takes place in the space of about fourteen or fifteen days, when they break from the surrounding glutens, and, like the tadpoles of frogs, swim about in the water, and are nourished by various animaliacs, glutton, leaves of aquatic plants, &c. When these have arrived at their full growth, the legs are formed, the tail gradually becomes obliterared, and the animals leave the water, and betake themselves to the surface of the ground. This generally happens early in the autumn.

The time of their propagation is very early in the spring; at which season the females are seen crawling about oppressed by the males, who continue on for hours, and adhere so fast as to tear the skin from the parts to which they stick. The number of females appears to be greatly disproportionate to that of the males in general. It is ascertained by Mr. Arlott, a gentleman of Devonshire, who favoured Mr. Pennant with a circumstantial account of a favourite toad kept for nearly forty years in his houfe, and a curious history of the toads, that he has commonly known thirty males to one female: twelve or fourteen of the former he has seen clinging round a single female at one time. But this is even far less remarkable than the observation of the late Mr. John Hunter, who assiduously Mr. Pennant, that during his residence at Belleisle, he had diffected some hundreds of toads, and yet never met with a single female amongst them.

That the female toad receives the obleretical assistance of the male on some occasions is a fact established on the best authority. Mr. Demours, in particular, has given a full and accurate account of such a circumstance in the Memoirs of the French Academy, that deserves attention. It has been more than once repeated by later writers, but cannot still, with propriety, be omitted in this place. The memoir is thus translated by Dr. Templeman: "In the evening of one of the long days in summer, Mr. Demours, being in the king's garden, perceived two toads coupled together at the edge of an hole, which was formed, in part, by a great stone at the top. Curiosity drew him to see what was the occasion of the motions he observed, when two facts, equally new, surprised him. The first was the extreme difficulty the female had in laying her eggs, infomuch that she did not seen
feet capable of being delivered of them without some assistance. The second was, that the male was mounted on the back of the female, and exerted all his strength with his hinder feet in pulling out the eggs, whilst his fore feet embraced her breast.

"In order to apprehend the manner of his working in the delivery of the female, the reader must observe that the paws of these animals, as well those of the fore-feet, as of the hinder, are divided into several toes which can perform the office of fingers.

"It must be remarked, likewise, that the eggs of this species of toads are included each in a membranous coat that is very firm, in which is contained the embryo; and that these eggs, which are oblong, and about two lines in length, being hardened one to another by a short, but very strong cord, form a kind of chaplet, the beads of which are distant from each other about the half of their length. It is by drawing this cord with his paw, that the male performs the functions of a midwife, and acquires himself in it with a dexterity that one would not expect from so lumpish an animal.

"The presence of the observer did not a little discompose the male: for some time he flopped short, and threw on the curious spectator a fixed look that marked his disquaintness and fear; but he soon returned to his work with more precipitation than before, and a moment after he appeared undetermined whether he should continue it or not. The female likewise discovered her uneasiness at the sight of the stranger, by motions that interrupted sometimes the male in his operation. At length, whether the silence and steady posture of the spectator had dissipated their fear, or that the ca!se was urgent, the male refrained his work with the same vigour, and successfully performed his function.

"The hideous appearance of the toad, Mr. Pennant remarks, is such as to have rendered it in all ages an object of horror, and the origin of most tremendous inventions. Elian makes its venom so potent, that, bathfull-like, it conveyed death by its very look and breath; but Juvenal is content with making the Roman ladies who were weary of their husbands, form a potion from its entrails, in order to get rid of the good man:

"Occurrit matrona potens, quae molle calumen Porrectura vino milict fisitene rubetam." Sat. I.

This opinion begat others of a more dreadful nature; for in after-times superstition gave it preternatural powers, and made it a principal ingredient in the incantations of nocturnal hags:

"Toad that under the cold stone
Days and nights has, thirty-one,
Sweeter'd venom fleecing got,
Boil thou, first, by 'charm'd pot.'"

-Shakspeare.

But these, and other similar fables of its venomous properties, Mr. Pennant observes in another place, have been long since exploded. The notion of its being a poisonous animal, he conceives to have arisen from its excessive deformity, joined to the facility it has of emitting a juice from its pimplies, and a fudgy liquid from its hind-parts. That it poiffles any noxious qualities, this writer was unable to bring forward proofs in the smallest degree satisfactory, though we have heard many strange relations on that point. On the contrary, he knew several of his friends who have taken them into their naked hands, and held them long, without receiving the least injury. It is well known that quacks have eaten them, and have besides tquizzed their juices into a glass and drank them with impunity. We may also lay, that these reptiles are a common food to many animals, such as buzzards, owls, Norfolk plovers, ducks, and snakes, neither of which, Mr. Pennant concludes, would touch them were they in any degree noxious.

It appears, however, from the experiments of Laureni, that although the toad does not possess any poisonous properties, it is not perfectly innocuous to the smaller tribe of animals. He found that small lizards, on biting the common toad, were for some time disordered and paralytic, and even appeared dead, though they completely recovered afterwards. He also observed, that dogs, on seizing a toad, and carrying it for some little time in their mouth, will appear to be affected with a very slight swelling of the lips, accompanied by an increased evaporation of saliva; the mere effect of the slightly acrimonious fluid which the toad, on irritation, exudes from its skin, and which seems at least to be productive of no dangerous symptoms in such animals as happen to taste or swallow it. For a further account of this creature, see the articles Toad, and Rana.

BUFONIA, in Botany, said by Dr. Smith, in English Botany, to have been so named by Linnaeus after the celebrated Count Buffon at the instigation of Sauvage, but with the invasions addition of the trivial name tenusfolia, to express the fleuringness of that great zoologist's claim to a botanical honour, and with the malicious omission of one f in the generic name; whence it seems rather to be derived from the Latin word Bufo which signifies a toad. Venetan actually adopts this etymology, and says the name was given in account of its growing in marshy places. Dr. Withering seems to have entertained the same idea when he called it toad-grafs. Gartner, Schreber, Professor Marty, and Dr. Smith have added the other f; but we have preferred the original spelling of Linnaeus, which has been followed by most other authors. Linn. Richard 17%. Willd. 260. Gen. 124. Juff. p. 520. Vent. vol. iii. p. 258. Clafs and order, instr gefunden. Nat. ord. Caryophyll. Jufs. Vent.

Eff. Char. Calyx four-leaved: petals four: calyx one-celled, two-valved, with two seeds.

Obf. It is sometimes deficient in the number of its flaments.

Species. 1. B. tenusfolia. Linn. Sauyage Monn. 141. Ger. Prov. 400. Villars Dauph. 630. Hidun H. Aug. 72. With. ed. 3 v. ii. p. 329. Smith H. Brit. v. i. p. 191. Gart. Tab. 120. f. 1. La Mareck Pl. 87. f. 1. bad. Eng. bot. 1313. "Stom-panicled; flowers lateral and terminal; calyx frirted." La Mareck Illust. annual. Stems one or more, six or eight inches high, slender, erect, branched, round, leafy, smooth. Leaves erect, opposite, awl-shaped, three ribbed conuate, with a broad sheathing base. Flowers white, peduncele, forming a spikelike panicule. Calyx-leafs lanceolate, with a white edge. German superior; styles short, ditant: stigma capitate. Seeds large and rough. A native of dry situations in Spain, which invalidates Ventenat's reason for deriving the generic name from Bufo, a toad. Its chief claim to a place in the English Flora rests on the authority of Plukenet, who has certainly figured it and affirms that it was found by the sea-fide near Bolton in Lincolnshire. On this ground Ray, who had seen it near Montpellier,
Montpellier, but not in England, admitted it into the second edition of his Synopsis. Dillenius, in the third edition, says it was found also by Doody, on Harelaw hill; but it has not since been discovered in either of those places.

B. parvus, La Marec, Huf. Pl. 87, f. 2. "Stems branched and bearing flowers near the top; calyx leaves fearfully at the edge" perennial. Peduncles longer than in the preceding species, forming a panicle without the appearance of a spike. Frequent in dry stony places in Anvergone.

BUFFONIS, in Zoology, a species of **ascaris** found in the intestines of the toad. The body of this kind is filiform, and the tail rounded. It is viviparous. **Goeae**.

**Bufo**, a species of **tænia**, or tape worm, that infests the intestines of the toad. The anterior part is roundish, behind filiform: head continued obutise: joints invested with a thin membrane, cylindrical, and oblong; margin siliery. **Gmel.** It is **Tænia** dispar of **Goeae**.

Obs. The colour is white, and opake. Length of the worm six inches.

**Bufo**nita, in Natural History, the toadstone. This is a fossil that has been received not only among the hit of native flones by the generality of authors, but even has held a place among the gems, and is still worn in rings by some people: it is, however, as much an extraneous fossil, as any animal remaining of that kind. There has been a strong opinion in the world, that it was found in the head of an old toad; and that this animal voided it at the mouth, on being put on a red cloth.

The general colour of the bufonita is a deep, dusky brown; but it varies greatly in this respect: in several specimens, some of which are quite black, others of an extremely pale, siphne brown, a chelteur colour, liver, brown, grey, or whitish.

The bufonitas are usually found immersed in beds of flone; and so little doubt is there of what they have originally been, viz. the petrified teeth of the **lupus pedis**, or wolf fish, that part of the jaw of the fish has sometimes been found, with the teeth petrified in it. See **Gréonere**.

The bufonita are said to be cordial and alluring: many other fanciful virtues are ascribed to them, which the present practice has rejected.

Dr. Kramer says, **pouls buonam**, when applied by way of prescription, with barley-flour and urine, is an excellent remedy for rippening pelitian bulboes, but that it has no such effect in venereal, or any other than petiliian bulboes.

**Bug**, in Entomology. See **Cimex**.

**Bug**, in Geography, a river of Poland, which rises in Red Russia, and after a winding course through the centre of the kingdom, joins the Villula between Ploëtia and Warsaw.

**Bug-caterpillar**, in Entomology, a name given by Bonnet to a small kind of caterpillar, which smells exactly like a bug. This is not the only species which yields a febible smell, for there is another which, at the time of the change into the chrysalis state, emits a very pleafant refe-like scent; and their cases, which are made of earth and fikl, retain that smell for a long time after, even for several years. Many other insects in this state are known to have a peculiar scent. See **Larva**.

**Bug marble**, in Natural History, a name given by the Spaniards to a species of black marble, called by our artificers the Namur-marble, and known among the ancient Romans by the name of **marmer Lucileum**. It is common in many parts of Europe, and is used by the Spaniards in medicine as well as in building; the powder of it being said to be an excellent styptic, applied to fresh wounds.

**Bugaleit**, in Sea-language, a small vessel with two masts, used on the coast of Brittany. The foresail is very short; and on each mast is carried a square sail, and sometimes a top-sail over the main sail. These vessels have a bowsprit, and set one or two jibs.

**Bugaronie**, Cape, in Geography, lies on the coast of Africa, in the Mediterranean, between Bugia bay on the West, and Cape Ferra on the East.

**Bugat**, a town of France, in the department of the Corrèze, and chief place of a canton in the district of Ust; the town contains 629, and the canton 6011 inhabitants; the territory comprises 507 square leagues and 12 communes.

**Bugee**, in Zoology, a sort of monkey mentioned by Ray in his Synopsis of quadrupeds. He tells us it is an Indian animal, and very rare even in India; that it is about the size of the beaver, and much of the same colour, but its tail and claws are wholly of the monkey kind. The species meant by Ray is altogether uncertain.

**Bugeley**, the name of a large species of lizard, called by Clufius, and some other authors, **Lacerta indicus**. This is **Lacerta Asiatica** of **Gmelin**. See **Ameiva**.

**Bugen**, in Geography, a town of Germany, in the circle of Upper Saxony, and middle mark of Brandenburg, 10 miles W. of Frankfort on the Oder.

**Bugenhagen**, or **Bugenhabius**, John, in Biography, a learned protestant divine, was born at Wollin in Pomerania, in 1485. From being a Catholic priest and a violent opposer of Luther's doctrines on their first promulgation, he became a convert and zealous propagator of them in the north of Germany. At Wittenberg, where he was a minister, he was in high esteem both for his learning and moderation; and his reputation induced Chrifiem III. king of Denmark, to invite him for the purpose of settling the reformation in that kingdom. In this arduous task he gave great satisfaction. He died at Wittenberg in 1558. Of his various works the most worthy of notice are, "Commentaries on the Holy Scriptures," in several volumes, **Svo.** a "Harmony of the Evangelists," and a "History of Pomerania." Nouv. Dict. Hist. Motheim, E. H. vol. iv. p. 304.

**Bugey**, in Geography, a province or small district of France, before the revolution, bordered on the east by Savoy, on the south by Dauphine, on the west by Breil, and on the north by Franche Comté, and dependant on the government of Burgundy. It is about 20 leagues long, and 12 broad. Its capital is Bellev. Before the time of Brennus, the Bugey, the tract of land denominated Gian, and part of Breil, formed a distinct country; which is termed by Polybius the "Celtic Delta," in allusion to its triangular form. M. Peter I. I. Bacon-Taco in his "Recherches sur les Origines Celtiques, &c." Paris, 1799, traces the primitive history of Bugey to the first ages of the world, and thinks that its mountains retain their original form; being a continuation of mount Jura, which is itself closely connected with the Alps. He also endeavours to prove, that the worship of Isis was, from time immemorial, established in the Bugey; and that the topographical nomenclature of the county is filled in a manner entirely "Hellenic." He is inclined, likewise, to suppose, that the inhabitants of this district, 600 years before our era, accompanied Belboefis, from the first part of whose name is derived Belvédère, on his memorable expedition into Italy, where he founded the cities of Cremona, Vicenza, Aquileia, Pavia, Mantua, &c. From various concurring sources this author...
also concludes, that the Rhodians, about 300 years before Christ, founded a colony on the Bugge, and on the authority of Pinty and Enelibus, he affirms that they gave their name to the river Rhone. He further conjectures, from some names that occur in Bugge, that some intercourse formerly subsisted between this country and England; and that the Gauls peopled our island, and founded the cities of London and Dover.

BUGGANG, Baga-Banta, or Bukanetz, a royal, free, and mine town of Hungary, in the Bath district, formerly famous for its gold and silver mines, but now subsiding by tillage. It was locked and burnt by the Turks in 1694; 32 miles W. of Gran.

BUGGARD, a town of Denmark, in the island of Funen, 16 miles W. of Odense, or Ottensee.

BUGGENHAGT, in Ichthyology, a species of Cyprinus, distinguished, according to Bloch, by having nineteen rays in the anal fin.

The length of this fish is about twelve or fourteen inches; its body is of a blackish colour above; comprised on the sides, and silver scales large: flesh white. This fish is found in the lakes of Germany and Sweden.

BUGGERS, Bulgarians, anciently signified a kind of heretics, otherwise called Patarini, Cathari, and Albigenfes.

The word is formed of the French Bougre, which signified the name, and that from Bougria or Bulgaria, the country where they chiefly appeared.

The Buggers are mentioned by Matthew Paris, in the reign of Henry III. under the name of Buggus. Circa dies autem illi venerant heresitas pravitas eorum qui vulgariet discentur Patarini et Buggus, de quorum erroribus malo tactor amqui loqui.

BUGGER, or BUGGERER, came afterwards to be used for a Sodomite; it being one of the imputations laid, right or wrong, on the Bulgarian heretics, that they taught, or at least practised, this abominable crime. Cacen. Orig. p. 27. Menag. Orig. p. 114. Trev. Dic. Univ. tom. i. p. 1149. voc. Bougre. Du-Cange, Gloss. Lat. tom. i. p. 267. voc. Bulgari.

BUGGER, Bulgarius, is also a denomination given to ulers, a vice to which the name heretics are said to have been much addicted. Du-Cange, Gloss. Lat. tom. i. p. 267.

BUGGERY, in our Laws, signifies the crime of sodomy; it is said to have been introduced into England by the Lombards, by whom it is usually supposed to have been borrowed from the Buggers, or Bulgarians. Sir Edward Coke defines buggerry, carnali capula contra naturam, et hoc per consuetudinem spectorum (viz. by a man's or woman's coupling with a brute beast) vel sexuum, by a man's having to do with a man, or a woman with a woman.

The delinquents of the English law treats this crime, in its very indentures, as must be named, "pecatum illud horribile, inter Chrestianos non nominandum." Ret. Parl. 50. Edw. III. n. 58. A similar taciturnity was observed by the edict of Constantine and Conflans. Cod. 49, 49, 51.

This crime the voice of nature or of reason, and the express law of God (Tit. xx. 13, 14) determine to be capital. Of this we have a signal instance long before the Jewish dispensation, in the defilement of two cities by fire from heaven; so that this is an universal, nor merely a provincial precept. Our ancient law in some degree imitated this punishment, by commanding such miscreants to be burnt to death (Brit. c. 9); though Fleta (i. c. 37) says, they should be buried alive; either of which punishments was indifferently used for this crime among the ancient Goths. Sten. de jure Goth. 1. 5. c. 2. But now the general pu-
Mecca, and about 37 leagues west of it. N. lat. 23° 15', E. long. 38° 40'.

Species, B. spectabilis, La Merck, Illus. Pl. 294. A beautiful evergreen shrub. Stem armed with recurved prickles placed a little above the axis of the leaves. Leaves alternate, petiolar, roundish-ovate, acuminate, very entire, veined. Panicule terminal; peduncles three-flowered. Flowers inserted on the midrib of a roundish bract, resembling a leaf longer than the flower, seated on the common peduncle, and adhering to the bottom of the corolla. A native of Brazil described and figured from a dried specimen sent by Commerford.

Buggletham, in Geography. See Baglana.

Buglas, See Island of Negros.

Buggle, in Botany. See Ajuga.

Bugs, among Sportsmen, formed probably from the Saxan bugen, to head, denotes a hunting-horn.

In Heraldry, the bugle-horn is generally borne fringed and garnished; which circumstance must be included in the blazon.

Bugs, is also used for a frissing bead of black glass.

Buglio, in Geography, a town of Switzerland, in the Valdeline. N. lat. 46°. E. long. 9° 40'.

Buggle, in Botany. See Anchusa.

Buggloss, common blue vipers. See Echiurn vulgare.

Buggloss, cowslips. See Pulmonaria officinalis.

Buggle, wild vipers. See Echiurn Italicum.

Buggle, small wild vipers. See Asperugo procumbens.

Buggloss, fes. See Pulmonaria maritima.

Bugglossa, Brunf.

Bugglossa Italiana. Trag. See Anchusa officinalis.

Bugglossa urbania. Cord. See Borago officinalis.

Bugglossum, a genus instituted by Tournefort, the species of which have been distributed by Linneüs and his followers among the genera lithospermum, anchusa, and lycoptis. It has been revived by Gartner with the following essential character: "Calyx five-parted; corolla funnel shaped, orifice closed with arched scales; stamens five; style one; nectaries four, one-celled, perforated at the base."

Bugglossum orientale flore luteo. Tourn. See Lithospermum orientale.

Bugglossum Sanium fruticos. Tourn. See Lithospermum fruticosum.

Bugglossum Ghiurm arvenae. Tourn. See Lithospermum intermedium.

Bugglossum germanicum Fuch. See Anchusa officinalis. Bauh. Pin.

Bugglossum Creticae. Boerh. See Anchusa angustifolia.

ment of Ufa, seated on the Kinel; 148 miles W.S.W. of Ufa.

BUGUTCHANI, a town of Siberia, 108 miles E. of Emirk.

BUHEL, or BUHEL, a town of Germany, in the circle of Swabia, and margravinate of Baden, 6 miles S.W. of Baden.

BUHLITZ, a town of Germany, in the circle of Upper Saxony and Further Pomerania.

BUI, a town of Ituria, belonging to the states of Venice, the residence of a governor; 9 miles S. of Capo d'Ituria.

BUILDING, Art of. The art of building is, perhaps, the most ancient of all arts; clothing is rejected or dispensed with by some savages, and in some favoured climates the arts of procuring food are rendered almost unnecessary by the unfolicited bounty of nature; but we are acquainted with no people that do not form dwellings, places of shelter and security during the night, of assembly to the family, and госупes of the property, however trifling, that none are without. It is not even confined to man; birds, beasts, and insects, have their architecture; but their modes, inspired by instinct, are invariable as the operations of nature; to man alone is given the principle of improvement.

The forms and methods of building depend essentially on the nature of the materials furnished by the country, and the state of society among its inhabitants; and, accordingly, nations very remote in situation, and distant in time, have resembled one another in these particulars. Vitruvius relates that the Celts, in the kingdom of Pontus, where they abound in forests, fix trees in the earth close together in ranks to the right and left, leaving as much space between them as the length of the trees will permit; upon the ends others are laid transversely, which enclose the space for habitation in the middle; then at the top the four angles are braced together with alternate beams, and the roof is also formed by beams laid across from the extreme angles gradually converging, and rising from the four fides to the middle point at the top, and then covered over with boughs and loam. The interstices which remain in the walls, on account of the coarseness of the materials, are stopped with chips and loam. The reader will observe how accurately this passage describes the log-houses of the American back- settlers. On the other hand, the Phrygians (continues Vitruvius) who inhabit a champaign country, delitute of timber, fetch little natural hills, excavate them in the middle, dig an entrance, and widen the space within as much as the nature of the place will permit; above they fix flakes in a pyramidal form, and cover them with reeds or straw, heaping thereon great piles of earth. This kind of covering renders them very warm in winter and cool in summer. The habitations of the Phrygians thus described, appear to resemble very nearly the subterraneous dwellings of the Samoyedas and Greenlanders. The kind of cabin, however, most frequently found among barbarous nations, is of a conical shape, formed by branches of trees interlacing one another, and meeting in a point at the summit, their exterior surface being covered with reeds, or leaves, or clay. Such are the wigwams of the North American Indians, and the kraals of the Hottentots and Caffres.

But to proceed to civilized nations. The edifices of the Egyptians, which are regarded as the earliest monuments of wrought stone, are also the most distinguished in that method. The immense quarries of Egypt probably inspired the task, as they furnished the materials, while the periodical overflows of the Nile facilitated their transport. Thus favoured by nature, the energetic industry of the ancient Egyptians delighted in every thing wonderful and gigantic; the pyramids, immortal as the country, proud tombs which have long outlived the memory of the mighty kings whose ashes they contain; granite temples, extensive as towns, and surrounded as cabinets, temples which enclose in their courts, or support upon their roofs villages of the modern inhabitants; mile long avenues of sphinxes, colossal statues, and obelisks. The art of building, among the Egyptians, was reduced to the simplest principles; unacquainted with arches, the doorways and other openings were covered with solid lintels, and the temples roofed with mafly slabs, the walls, columns, and entablatures were formed of stones of the largest size, perfectly wrought, and laid in horizontal courses, without cement or ligatures; the walls were of enormous thickness, and generally diminishing upwards, with a regular slope, in the manner of fortifications. The passage within the great pyramid is roofed in a regular manner with courses of stones projecting over one another, like inverted steps, till they meet at the summit; thus shewing a method of ceiling with stone which may be regarded as intermediate between the use of lintels and of arches. Some of the tombs also present examples of vaults hollowed in the solid rock, and of niches. So far, and, according to our present information, no farther did the Egyptians proceed towards the discovery of arches. But we expect with patience the account to be published by the National Institute of France, when accurate measurements, correct drawings, and minute research, conducted under all the advantages of leisure and protection, will replace the hasty sketches and imperfect remarks of individuals, who, though deferving of applause and gratitude for having done so much, under circumstances of danger and discouragement, have left still more to be desired. The size of the mafly of stone employed in these constructions is altogether astonishing, and displays mechanical skill and energy, which leave far behind all the similar enterprises of modern nations. Thus, in the temple of Hermopolis, one of the largest of the remains, the columns are 9 feet 6 inches in diameter, the architrave is composed of five stones, each 23 feet long, and the frize of as many; the only remaining stone of the cornice is in length 36 feet. Of the hundred columns of the portico of the temple at Karnac, the leaf is in diameter 8 feet, and the greatest 12 1/4 feet. The two obelisks at Luxor, of rose-coloured granite, are still 70 feet above the ground, and to judge by the depth to which the colossal statues which accompany them are buried, we may reckon about 30 feet more concealed from the eye, making in all 100 feet for the height of these monuments. Their preservation is perfect; the hieroglyphics with which they are covered are cut in deep and in relief at the bottom, and shewed the bold hand of a master, and a beautiful finisb. (Denon's Travels in Egypt.) But the account which Herodotus gives of the monolythic chapel of the temple of Latona, at Butias, is the most extraordinary; it was 40 cubits in every dimension, and was covered by another single stone, 40 cubits square, and 4 cubits thick. The fame historian also informs us, that this enormous load was brought on rafts from the island of Phyliss to Butias, a distance of 200 leagues. This is undoubtedly the greatest weight that has ever been moved by the power of man.

The wonders of human industry also characterize the monuments of the ancient inhabitants of India; but their efforts were directed, almost exclusively, to excavation. The
BEADING.

The caves of Elephanta and Saliare, the sculptured rocks of Mavataram, and, above all, the vast temples scooped in the granite mountains of Ellora, rival, in the indestructible labour of their execution, the works of the Egyptians.

The records of Persepolis retrace the style of Egypt; from whence it appears, that the Persians received the art of building to an upright stone. Diodorus Siculus relates, that it was not till after the conquest of Egypt that they built the famous palaces of Susa and Persepolis, and that these great works were directed by Egyptian architects.

The fame table for gigantic constructions and extraordinary works, in large stones, is found among nations who, without communication with those already mentioned, must receive it from nature alone. When the Spaniards conquered Mexico and Peru, they remarked, that the natives were accustomed to build edifices with large stones, perfectly wrought and jointed, and laid without mortar; they had also transported from distances many of extraordinary dimensions. Stonehenge, and various works of the same nature, in our own country and on the continent, may also be mentioned as effects of energetic construction, which had preceded every thing of finick and ornament. Thus it should appear that this mode of building has everywhere been adopted previously to that with small stones and mortar.

The inhabitants of countries deprived of stone quarries supplied the deficiency by means of bricks. These were at first used crude, being merely dried in the sun, during a considerable time; but at length the manufacturers found the method by baking them to form bricks as solid and durable as stone. Of this material were built the walls of Babylon and the temple of Belus, the most ancient example of this mode of construction which history records, and which were reckoned among the wonders of the world. We also learn that bitumen was used as cement in these buildings, which renders it probable that at this period the method of reducing calcareous stones into lime to form mortar was not known.

It is, however, to the discovery of lime, that we owe the durability and perfection of cementitious building. Bitumen forms a porous connection which the air diffuses and the action of the sun evaporates, while calcareous cements are capable of acquiring a hardness superior to that of the general character of bricks and building stones.

The buildings of the Greeks were at first of wood and clay; but they soon substituted stone and marble to the beams and posts which formed their original edifices; and these were so regular and beautiful, that they offered a model, which art never lost sight of in the most fumptuous decorations. From this imitation arose the orders of architecture, and a refined style, which, affording to every member its use and situation, preferred its original form, and perpetuated the memory of the ancient art of building. The Greeks, favouring by nature with abundant quarries of marble and other building stones of the best quality, proceeded on the same simple principles of construction which characterize the Egyptian monuments: large blocks of stone squared with mathematical accuracy, and laid without cement; openings covered with lintels, with a few exceptions of arches and vaults in the theatres and gymnasias; pediment roofs frequently covered with marble tiles. The observations of Mr. Beverley, given in the preface to the third volume of Stewart's "Antiquities of Athens," defend transcription. I shall add a few words on the construction of the buildings of Athens, which have not been mentioned in this work. The temple of Minerva is an example of this important part of their architecture. The columns are all constructed of single blocks in diameter, and in courses of more than a diameter in height: the wall enclosing the cell of the temple, is formed of a single course of marble blocks in thickens, giving a face inside and outside, the vertical joints corresponding over each other, and in seventeen horizontal courses, reckoning from the bottom of the architrave to the top of the upper step, rising to a height of thirty-three feet. The capitals confit each of one single block, 2, 9, 9, high, and the architrave lies upon them without any other precaution being taken to relieve the weight from the projecting edges of the abacus, than the most extreme accuracy in the two surfaces of the underface or soffit of the architrave, and the top of the abacuses, to render them perfectly parallel. The architraves are composed of three blocks, from face to back, each extending from centre to centre of the columns, and each block alo the whole height of the architrave, and of equal thickens. The frieze is in two courses in height, and each course wants so much of being the whole thickens of the frieze, as allows the metope, with the sculpture, which is cut on a thin slab, to lie against it. The triglyphs tail in one height, but do not go through. I observed that a triglyph, lying among the ruins, was so formed, that the back of the block was considerably narrower where it went into the frieze than the breadth of the triglyph, so that each extremity of the triglyph projected on to the face of the slab of the metope several inches, thus forming a rebate, which enclosed the metope. The cornice is in blocks, which are the width of one mutule and one space, their ends forming a complete course on the inside. The tympanum of the pediment is composed of one course of upright slabs, in the outside face, with horizontal courses behind them. The pavement, of which great part remains, is in squares of equal size, large and thick; the joints, as is the universal practice at Athens, are cut with the mott mathematical precision, and are extremely difficult to discover in those parts which have taken a dark tint. "The perfect flat in which these monuments remain, which have not been destroyed by violence, is one proof of the judgment with which they were constructed. The temple of Minerva would have been entire, except its timber roof, at this day, if a bomb had not been thrown into it by the Venetians, when it was used as the powder magazine of the Turks. The propylæa, applied to the same purpose, was blown up by lightning, and blown up. The small temple of Theseus is almost as entire as when it was first erected. Even so small a building as the Choragic monument of Lyciae is now entire, a circumstance arising chiefly from the great judgment shewn in its construction, by erecting it with large blocks, and consolidating the whole with a roof wisely made of one single piece of marble." The erection of porticos required a frequent employment of very considerable blocks, and accordingly implied great skill in the art of transporting and elevating these masses. Vitruvius celebrates the limpid and ingenious method practiced by Ctesiphon, in conveying the shafts of the columns of the temple of Diana at Ephesus from the quarries, which were in single stones, sixty feet long; these, by means of axle-trees, adapted at each end, were made to revolve in the manner of a garden-roller.

The ancient Etruscan have left monuments of the same taste in the art of building; however, it is to them that is generally ascribed the method of building with small stones and mortar, at least, it is in the country which they inhabited, that are found the most ancient vestiges of this mode of construction. This method was carried to perfection by the Romans, who were also probably the inventors of domes. Their first temples were round and vaulted, as those of Quirinus, Romulus, Faunus, Cybele, Vesta, &c. Colatus was the first Roman architect who built after the manner of the Greeks, about
200 years before the Christian æra. From this period, though the Romans adopted the Grecian architecture, they did not reject their original mode of construction. Their most considerable edifices are built with pebbles and rubble stones, grouted in mortar, with the arches and angles and facings of brick, or small rubble stones squared, and strengthened at intervals, with regular bonding courses of stone or brick, running through the whole thickness. The walls, so built, were generally inclosed with flint or marble. This method of building is much more expeditious and economical than concretions of wrought stone, which occasion a considerable waste of materials, extraordinary labour in dressing and squaring, and necessitate great expense in removing and elevating. By this method the Romans, employing all kinds of workmen, and materials to the smallest fragments, were enabled to raise the prodigious number of edifices which surpas, in extent, the monuments of any other people.

Vitruvius describes the different kinds of wall used in his time in this manner. The forts of walls are the reticulated, which is now generally used, and the ancient, which is also called the uncertain. Of these two, the reticulated is the handsomest; but the joints are so ordered, that in all parts the courses have a firm position; whereas, in the uncertain, the materials rest firmly one upon the other, and are interwoven together, so that they are much stronger than the reticulated, though not so handsome. Both forts are formed of very small pieces, that the walls, being saturated with mortar, may endure longer; for the stones being of a porous and spongy nature, absorb the moisture from the mortar, and when there is abundance of mortar, the wall having more humidity, will not so soon decay, but will, on that account, be rendered more durable; for as soon as the humidity is extracted from the mortar by the fission of the stones, then the lime and sand separating, the cement is diffused, and the mortar, no longer uniting the materials, the walls soon become ruinous. This may be observed in some tombs near the city, which are built with marble, or hewn stones, and the internal parts rammed with rubble stone; the mortar being, by length of time, drained of its humidity by the fission of the stones, and the union of the joints being diffused, they separate, and fall to ruin. To avoid this error, Vitruvius proceeds, the middle space must be strengthened with abutments of the red hewn stone, or bricks, or common flints built in walls two feet thick, and bound to the front with cramps. Another fort, is that called by the Greeks empelion, which, (says Vitruvius), is also used by our villagers. The faces of the stones in this kind are smooth, the reef is left as it grows in the quarry, being secured with alternate joints and mortar; and our artificers quickly raising a shelf, which serves for the faces of the wall, fill the middle with rubble and mortar. But the Greeks do not build in that manner; they do not only build the facing courses regularly, but also alternate joints throughout the whole thickness, not ramming the middle with rubble, but building it the same as the face; besides this, they dipole single pieces, which they call ditamos, in the thickness of the wall, extending from one face to the other, which bind it exceedingly strengthened the wall.

Two works in wrought stone of the Romans were, as well as those of the Greeks, constructed without cement; but they used cramps and ligatures of iron and bronze in extraordinary profusion. It is remarked by Mr. Wood, in describing the great temple of Balbec, probably a work of Antoninus Pius, that "the shafts of these columns consist of three pieces, joined most exactly without cement, which is used in no part of these buildings, and strengthened by iron pins received into a socket worked in each stone. Most of the bases had two such sockets, one circular and another square, corresponding to two others of the same shape and dimension in the underpart of the shaft. By measuring one of the largest of these, which were circular, we found the iron pin which they received must have been a foot long, and above a foot in diameter. When we observed, by finding such sockets in all the fallen fragments of this temple, that each stone had probably been strengthened in this manner, we were left surprised at the quantity of iron paid to have been carried away by the Bafhaws of Damascus at different times from these ruins, on which they had left evident marks of their violence, though unsuccessful attempts to get at the iron of the columns which are flailing. How much this method contributes to the strength of the building, is remarkably seen in the temple entire, where a column has fallen against the wall of the cell with such violence, as to beat in the stone it fell against, and break part of the shaft, while the joinings of the same shaft have not been in the least opened by the shock." The use of metal was not confined to cramps and bolts, the ancient even constructed roofs of bronze; the portico of the Pantheon, before its spoliation by Urban VIII., was covered with beams and rafters of this material. Tiled with marble, and supported with granite columns; this portico presented a rare combination of grand and beautiful architecture, with the richest materials, and the appearance of indestructibility. Serlio has preferred a design of this metallic roof, which was formed of beams and rafters, after the usual methods of carpentry; these were united and secured by pins and nails of the same metal; and as well to economize the materials, as to lessen the weight of the whole, the pieces were hollow. The interior of the portico is divided by the columns into three divisions, or aisles; the two lateral were ceiled, and that in the middle vaulted, also with bronze. The quantity and beauty of this metal may be appreciated by the throne of St. Peter, and the Baldacchino of the fame cathedral, the most considerable, beyond comparison, of modern works in bronze, and whose enormous masts is not the equivalent of the spolias of the Pantheon from which they were formed, for an inscription on the portico of this edifice informs us, that the excess of this valuable metal was cast into the canons of St. Angelo.

Bronze was also used with magnificent profusion in the decoration of buildings; thus many edifices preserve not indeed the ornaments themselves, these have long been torn away by the rapine of barbarism, but the marks and cramp-holes, by which were attached alto relievo or trophies or inscriptions.

It excites regret to reflect that the means employed by the ancients to increase the beauty and ensure the solidity of their edifices, have, in many instances, only served to accelerate their destruction; the beautiful marbles of the Grecian temples are continually carried off by Turkish carvers of grave stones, or burnt into lime; the inhabitants near the seat of the temple of Apollo Dilion, appear to have been principally supported by this impious manufacture. Palmyra and Balbec have long furnished mines of material to the neighbouring Baffaws; the Coliseum bears, in innumerable faccoided holes, the marks of an attempt at its entire ruin in search of the cramps which connect its stones; and the amphitheatres of Nimes are still blackened by combustions kindled for the same purpose; the temple of Peace, the baths and palaces of the emperors, and indeed almost all the edifices of grandeur and magnificence have been more ruined by the violences of rapine than the injuries of time.
It may be remarked, before we quit the subject of antique constructions, that the Greeks and Romans in their buildings of wondrous stone appear always to have worked only the beds of the stones before placing them in the building, leaving the faces to be worked after the erection of the edifice; an excellent method, which saves from injury the arches and buildings. On this account, unfinished columns are sometimes found in their remains; as in the relics of the temple of Apollo Didymaeus, near Miletus, may be seen two columns supporting their architrave, with the flutes entirely worked; also, one left standing in its unfinished state, the channels under the capital, and at the base only, being marked out, as a direction to the workmen in completing the fluting, after the structure was raised. (Onian Antiquities).

Similar instances are also found in the Island of Delos.

The durability and extreme solidity of the Roman cementitious buildings, in which the masonry has very generally acquired a vaulted superstructure to that of the rubble stones which it connects, compared with the fragility and crumbling nature of the mortar, used by modern builders, had led some to suppose, that the ancients possessed processes and recipes for the formation of cement, the knowledge of which had perished together with many other valuable secrets in the ages of barbarity, which succeeded the fall of the Roman empire. But better information, and the experiments of ingenious men, have exploded this opinion, and there can be no doubt, that proper attention to the choice of lime stone and sand, to the burning of lime, and, above all, care and labour in the mixing and tempering these materials, would enable our workmen to rival those of Rome in this important part of construction. In some instances, this has been tried, and though the lapse of ages may be necessary to make the comparison complete, yet present appearances are sufficient to banish any reasonable fear of the refult. See the article CEMENTS, calcareae.

Architecture, together with all the arts and sciences that adorn and illustrate humanity, experienced the feeblenees and degradation which attended the decline and fall of the Roman empire. Impudent compilers of the spoils of the edifices of happier times, the builders of those ages, have only perpetuated their own ignominy. Constanine was the first of these deplorers; he ruined the arch of Trajan to adorn his own with its inappropriate ornaments, and the Mausoleum of Adrian supplied columns to support the aisles of his churches.

In the general confusion occasioned by these practices, it is not to be wondered at that the principles of Grecian architecture, somewhat corrupted in the belte times of Rome, should be entirely lost: architraves were omitted and columns were made to support arches and vaults; arcades were everywhere substituted to colonnades, vaults to ceilings; thus the excessive use of arches and vaults is characteristic of the method of construction adopted in the middle ages.

This corrupted Roman style continued with various and increasing deteriorations, and under different names, as in our own country, of Saxon and Norman, to be the prevailing architecture of Europe till towards the 12th century, when what is generally called the Gothic style prevailed. This is an architecture of figurul and original merit, surprizing, and fantastic, and magnificent, and awful; but for the description of Gothic architecture the reader is referred to that article; our business at present is with the modes of building observed in these edifices.

The Gothic mode of construction is an ingenious compendium of building well adapted to the peculiar style of architecture; economical in materials and labour. Rejecting heavy cornices, architraves, and lintels, of all kinds, the builders had seldom occasion to use stones larger than a man might carry on his back up a ladder from scaffold to scaffold, though they had pulleys and spoked wheels upon occasion. Thus they were readily enabled to raise up their works to an extraordinary height; in which particular they appear to have placed great pride and emulation. Hence the lofty towers and spires, ambitious ornaments that tyrannize over the body of the building, and claim attention at the expense of those useful parts to which they ought, but disdain, to be inferior. The churches were adorned with groined vaulting, which threw the weight on the springing points instead of distributing the pressure equally along the walls, as was the case with the Roman plain vaults and ceilings; the points of pressure from the vaults were opposed by buttresses, and the intermediate spaces of the walls were thin, and occupied with windows; in this respect again differing from Roman construction where the walls are of uniform thickness in their whole extent, without apparent buttresses. The vaulting was ingeniously composed of a skeleton of hewn stone, and the interfaces filled in with lighter materials. Thus Mr. Price remarks, in his Observations on the Cathedral Church of Salisbury, that "the groins and principal ribs are of Chilmark stone, but the shell or vaulting between them is of hewn stone and chalk mixed, on top of which is laid a coat of mortar and rubble, of a confisence probably ground in a kind of mill and poured on hot while the lime was bubbling, because by this the whole is so cemented together as to become all of one entire substance. This composition is very remarkable, somewhat resembling the pumice stone, being porous and light, by which it contributes prodigiously to the strength of the whole, and at the same time the least in weight of any contrivance that perhaps was ever used."

The machine of a Gothic edifice, consisting so essentially of vaults and arches, required great contrivance in balancing and sustaining their preservatives; this was effected by means bold, ingenious, but sometimes preternatural and insufficient. The genius of these architects had a tincture of extravagance which led them to sacrifice always the apparent, and too often the real solidity of their buildings to those picturesque and marvellous effects which captivate the imagination of every one, but offend the judgment of the connoisseur. Accordingly these edifices must not expect to rival the duration of the immortal contrivances of Greece and Rome.

The pendants from the vaults are among the most pleasing and innocent of the plays of ingenious contrivance in the Gothic style; but the attempt to substitute weight to butment, generally observed in the middle aisle pillars of cathedrals, supporting an unslated preservative of the side vaulting, is a serious defect, which threatens the ruin of these venerable piles. On this account Sir Christopher Wren observes, that "almost all the cathedrals of the Gothic form are weak and defective in the poise of the aisles. As for the vaults of the nave, they are on both sides equally supported and propped up from spreading by the bow or flying buttresses which rise from the outward walls of the aisle. But for the vaults of the aisles they are indeed supported on the outside by the buttresses, but inwardly they have no other stay but the pillars themselves, which, as they are usually proportioned, if they flood alone without the weight above could not resist the spreading of the aisle one minute: true indeed the great load above of the walls and vaulting of the nave should seem to confine the pillars in their perpendicular ration, that there should be no need of buttment inward; but experience hath shewn the
The contrary, and there is scarce any Gothic cathedral that I have seen at home or abroad, wherein I have not observed the pillars to yield and bend inwards from the weight of the vault of the aisle.

Hence it appears that the method pursued in erecting these buildings was to infert the springing flones as the work proceeded, but to leave the vaults to be formed after the walls were carried up to their full height and the whole roofed in.

The pointed arch has several advantages over arches formed by one segment of a circle; particularly, as applied to vaults, it will rife with little centering, requires lighter voussoirs, and left the room clear. The Gothic architects seem to have perpetually calculd the minimum of neceflity, and scarcity of stone, and they displayed considerable skill in arranging the appearance of buildings by the choice of materials; we have already seen the light compactness of their vaults, and on the other hand they frequently used Purbeck marble, a very hard and strong flone for the slender shafts which had to support great weights. The roofs of Gothic buildings are very high pitched, a form more of choice than necessity, rather adopted in compliance with their pointed and pyramidal style of architecture, than necessitated by the climate, as they are generally covered with lead. These roofs are therefore fully in the walls with an unnecessary load of lead and timber, and they are also deficient in construction by the omission of eye beams to counteract their tendency to spread and thrust out the walls.

Modern architecture, though it has adopted its decorations from the remains of Greek and Roman antiquity, has still retained considerable traces of the Gothic style. These may be observed in the affeclication of height, in the ornamentations of domes and turrets, and in the fenestrae for complicated forms of plans and multiplicity of parts; and accordingly the construction also is a medium between Gothic tenacity and Roman prudence; the balancing of arches and vaults still exercised the skill of the architects; the doors of St. Peter's, of the Vatican, and St. Paul's of London, illustrate the ingenuity and mathematical science of their authors, but we no longer find apparent solidity rejected, or real solidity sacrificed. We have seldom the grand constructions in hewn flone of the Greeks, nor, on the other hand, the economical building of Gothic architects, nor the cementsitious walls of the Romans.

Stone, brick, timber, and metal, are our materials. Stone is used rough in rustic buildings, either dry or in mortar; but the flone employed in more finished edifices, either as facing to brickwork, or, where the material is plentiful, in the whole substance of the walling, is used in blocks of moderate size, squared and laid in mortar, and bonded with alternate courses; modern architects, and particularly the French, have shown much ingenuity in the laying of arches and piers and plat-bands. Iron is used plentifully both for cramping flones together and in ligatures to entire walls, thus all considerable domes are strengthened and secured from spreading by strong chains surrounding them; and lead is continually employed in large quantities on roofs. Timber is used in all edifices to form roofs and floors, and to bind and strengthen the walls and foundations, and many buildings are erected entirely with this material. Carpentery is the art in which modern workmen chiefly excel.

The buildings of this country may be comprehended under the following classes: rough flone, like the common houfes of the rocky districts, which are either worked dry or with mortar; hewn flone, as the buildings of Bath; brick and flone mixed, in which, as they are always remote from quarries of flone, that material is the most expensive, and therefore employed in the ornamental arts, as cornices, plat-bands, window fills, and all the members of architecture, and sometimes applied as a facing to the brick wall; in this manner are all the buildings of London; and, lastly, timber, which was formerly the most common of all, and is now a very considerable class: such are all the cottages of the poor out of the rocky districts, and many farm houfes and considerable dwellings. These are formed of a frame of timber-work, which in the better fort of houses has its interlaces filled in with brick-work, and is called brick nogg, or brick and flud, and then lathed over and plastered, or rough-caft, or fluced, or sometimes boarded; the poorer fort, however, are covered with reeds and clay. English buildings are roofed with reed and thatch, which was formerly the most general mode, and is still very prevalent in the country; also with tiles, slate, lead, and copper. Slates are used copiously in the flone counties, and brought thence to other parts, as a light, durable, and handsome covering. Tiles are the manufacture of the brick districts, and used there. Lead and copper, as the most expensive materials, are seldom employed to cover entire roofs, but chiefly for gutters and platforms.

Our buildings may justly claim the merit of lightness in construction, economy of labour and materials, and convenient distribution. Their real and evident defect is the want of solidity: this is in great measure to be attributed to the bad quality of the cements, which are composed with such disgraceful carelessness and ignorant haste by the workmen. Our bricks too, which are made on the principle which pervades all our manufacturers of sacrificing every thing to quantity and cheapness, are neither tempered nor burnt sufficiently. In the arts of carpentry and joinery our workmen are peculiarly eminent, both in the bold and skilful construction of roofs and bridges, and in neat and accurate internal finishings.

As the buildings of London are regulated by what is commonly called the Building Act, "an act for the further and better regulation of buildings and party walls, and for the more effectual preventing mischief and fire, within the cities of London and Westminster and the liberties thereof, and other the parishes, precincts, and places within the weekly bills of mortality, the parishes of St. Mary-le-bone, Paddington, St. Pancras, and St. Luke at Chelsea," which repeals and amends several former acts for the same purpose, it may be proper to give a brief abstract of part of it. This act, passed in the 42nd year of the reign of his present majesty, A.D. 1774, begins by dividing all buildings into seven rates or classes, for the purpose of subjecting them to various regulations respecting the thickness of their walls. Cap. 2. The first rate comprehends churches and all places of public worship, all buildings for brewing, distilling, soap making, melting of tallow, dying, boiling of turpentine, casting brass or iron, refining sugar, and glass making, of whatever dimensions these buildings may be, and also every warehouse, and other buildings whatsoever, not being a dwelling house, which exceeds three clear stories above ground, exclusive of the rooms in the roof, or which is of the height of 31 feet above the pavement of the street to the top of the coping; and every dwelling house, which with its offices connected otherwise than by a fence wall, or open passage, exceeds when finished the value of 80l., or covers more than nine squares of building on the ground floor, (each square containing 100 superficial feet). The regulations for these are, cap. 3 and 4, that all the external walls shall be built, at the foundation, of the thickness of two bricks and a half, or 21 3/4 inches, thence to diminish gradually 2 1/4 inches.
The road, Cap. 1.

From offices thence to the under side of the plate under the roof or gutter; and thence, the parapet is to be built in the thickness of one brick, or 8½ inches, with the exception of such parts of the wall as shall be wholly of stone, which may be of the thickness of 14 inches below the ground floor, and nine inches above. The party walls of the same buildings are to be built at the foundation three bricks and a half, or two feet six inches and a half in thickness; thence to diminish gradually 4½ inches on each side to the top of the footing, which must be one foot high, and two inches below the cellar floor; thence, the wall is to be built in the thickness of two bricks and a half, or one foot six inches and a half up to the under side of the ground floor; and thence in the thickness of two bricks, or 17½ inches, up to the under side of the floor of the rooms (if any) in the roof of the highest building adjoining to such party wall; and thence of the thickness of one brick and a half in length, or 13 inches, to the top of the wall.

Cap. 5. defines the second rate of buildings, which consists of every warehouse, stable, or other building, not being a dwelling house, that exceeds two clear stories, and does not contain more than three clear stories above ground, or which is of the height of 22 feet and under 31 feet from the pavement to the top of the coping; and also every dwelling house which with its offices exceeds the value of 500l., and does not amount to more than 850l., or which covers more than five, and less than nine squares of building. Cap. 6 and 7. The external walls of the second rate are to be built at the foundation in two bricks thick, and diminish regularly 2½ inches on each side to the top of the footing, which must be nine inches high; thence to be carried up in one brick and a half thick to the under side of the one pair of rafters floor; and thence of the under side of the coping of the parapet in the thickness of one brick; stone work excepted, which may be of the thickness of nine inches above the ground floor. The party walls are to be three bricks and a half at the foundation, diminishing 4½ inches on each side to the top of the footing, which is to be nine inches high; thence, the wall must be two bricks and a half thick up to the under side of the ground floor; thence, two bricks thick up to the under side of the floor of the two pair of rafters floor; and thence of the thickness of one brick and a half to the top of the wall.

Cap. 8. The third rate of building is defined to include every warehouse, stable, and other building, not being a dwelling house, which exceeds one clear story, or does not contain two clear stories above ground, or which is above 13 feet, and less than 22 feet in height from the pavement to the top of the coping, and also every dwelling house, which with its offices exceeds the value of 150l., and does not amount to 300l., or which covers more than three and a half, and less than nine squares of building. Cap. 9 and 10. The external walls of such buildings are to be two bricks thick at the foundation, and to diminish 2½ inches on each side to the top of the footing, which must be six inches high; thence, the wall is to be carried up one brick and a half thick to the under side of the ground floor, and thence, one brick in thickness to the coping of the parapet. The party walls are to be three bricks thick at the foundation, diminishing 4½ inches on each side to the top of the footing, which is to be nine inches high, and thence, to be built two bricks in thickness to the under side of the ground floor, and thence, one brick and a half thick to the top of such wall.

Cap. 11. The fourth rate of building which is defined to include every warehouse, stable, or other building, not being a dwelling house, which does not exceed one clear story above ground, or the height of 13 feet from the pavement; and every dwelling house which with its offices does not exceed the value of 150l., or three squares and a half of building. Cap. 12 and 13. The external walls of this rate are to be similar to those of the third rate. The party walls must be two bricks thick at the foundation, diminishing 2½ inches on each side to the top of the footing, which must be nine inches high; thence, to be carried up in one brick and a half thick to the under side of the ground floor; and thence, one brick in thickness to the top of such wall.

Cap. 18. Every building except such as are particularly included in the first or seventh rates, which is at the distance of four feet and not eight feet from any public road, and which is detached from any building not in the same polefion, 16 feet and less than 30 feet, is declared to be of the fifth rate, and may be built of any dimensions whatever.

Cap. 19. The fifth rate only differs from the fifth in demanding, that such buildings may be eight feet distant from the street or road, and detached 30 feet from other buildings; and this rate may be built of any dimensions, and with any materials whatever.

Cap. 20. Every crane house on any wharf or quay, and every timber, windmill, or water-mill, and also every building situated without the cities of London and Westminster, and the liberties thereof, used as workshops for tanners, fellmongers, glue makers, calico printers, whitters, whitewash makers, curriers, buckram fliners, oil-cloth painters, woolen shakers, throwers, or plastermakers, is declared to be of the sixth rate of building, and may be built of any dimensions whatever. Cap. 21. Crane-houses must be built externally of stone, brick, slate, tile, oak, elm, oak, iron, or brass; and all other buildings of the seventh class may be erected of any materials whatever, but must not be covered with pitch, tar, or any inflammable composition.

Cap. 22. Every office which shall be entirely detached from the building to which it belongs, or connected therewith only by a fence, wall, or covered passage, open on one or both sides, shall be deemed to be of the rate or class of building such office would be of, if it did not appertain to any other building.

Cap. 14. The materials of party walls are to be brick or stone, and no timber to be used in them, except such as is necessary for planking, bridging, or piling the foundation; and cap. 27. for temples, chans and bond, and also the ends of girders, beams, purins, binding and trimming joists, or other principal timbers, observing always to leave 8½ inches of solid brick work between the ends and sides of such timbers and the timbers of adjoining buildings. Cap. 26. Party walls are to be carried up one foot six inches above the roof of the highest adjoining building, which shall gable against them; and to be one foot above the jutters. Cap. 29. Chimmies built in party walls are subject to the following regulations: the back of the chimney from the hearth, to 12 inches above the mantle, is to be built in 13 inches thick in the basement story, and 8½ inches thick in the upper stories; and in those cases where chimneys are built back to back on each side of a party wall, the entire thickness of the backs is to be, in first rate houses, eighteen inches in the cellar story, and thirteen inches in the upper stories; and in the second, third, and fourth rates, the thickness in the cellar story is to be thirteen inches, and eight inches and a half in the upper stories.
Cap. 38. Every owner of any building within the limits of this act, who may think it necessary to repair or rebuild the party wall between himself and the adjoining premises, is to give three months' notice in writing to the owner of the adjoining building, appointing a survey to be made of the said wall, and naming two surveyors or able workmen on his part, and requiring the said party also to name two surveyors to meet at an appointed place, to view and certify the state of the wall. But if the owner of the adjoining premises shall neglect to appoint two surveyors on his part, according to notice, then the two surveyors first named, together with two other surveyors, to be named by the party giving notice, may, within six days after the time appointed in the notice, view the party wall, and certify in writing under his hand to the court of mayor and aldermen, or to the justices of the peace in their next quarter or general sessions as the case may be, the condition of the party wall, and whether the same, or any part thereof, ought to be repaired or pulled down and rebuilt; and in case the major part of the surveyors appointed shall not, within the space of a month from the appointment, sign the certificate, then it shall be lawful for any one or more of the justices of the peace for London or Westminster, or the county of Middlesex or Surry, as the case may be, to appoint one other surveyor to be added to the surveyors before appointed, all or the major part of whom are to meet, and view the party wall; and in case the major part of them shall certify the wall to be decayed or ruinous, and not sufficiently secure from fire, then, within three days from the making such certificate, a copy of it is to be delivered to the owner of the adjoining building, or affixed to the door if it is unoccupied, and also filed with the clerk of the peace in the city, county, or liberty, where such wall is situated; and the last mentioned owners may appeal from the certificate to the next general or quarter sessions, when the justices are to summon before them one or more of the surveyors, and examine the matter upon oath, and thereupon make such orders as they think fit.

Cap. 41. The person whose expense a party wall is built, shall be reimbursed by the owner of the adjoining premises who makes use of the wall, a part of the expense in the following proportion. If the adjoining building be of the same, or a superior class to the building belonging to the person at whose expense the party wall was constructed, the owner of such adjoining building shall pay one moiety of the expense of so much of the party wall as he shall make use of; but if the adjoining building be of an inferior rate, the owner shall pay a sum equal to a moiety of the expense of building a party wall, as required by the act for such class of building.

Cap. 46. Door and window frames are to be set in reveals and recesses, at least four inches from the front of the building, except the door cafes of warehouses. Cap. 48. Every coping, cornice, fascia, window dressing, portico, balcony, battlements, or other external decoration, or projection whatever, is required to be made externally of brick, stone, burnt clay, or artificial stone, flueco, lead, or iron, except the cornices and dressings to shop windows, or the covered ways to any building. No water is to be suffered to drip next to any public way from the roof of any building, except from the roofs of porticos or other entrances, but to be conveyed by metal pipes, or wooden trunks, or brick or stone tunnels into drains or referrers.

Cap. 49. No bow window or other projection shall be built next to any public street, so as to extend beyond the general line of the fronts of the houses in the said streets, except such projections as are necessary for copings, cornices, fascias, door and window dressings, or for open porticos, steps, or iron pallidfades; and also, except shop windows, which are allowed in streets 30 feet wide or more, to project ten inches from the line of the building, and five inches in streets of less width.

Cap. 53. No flack of warehouses shall contain more than 35 squares of building on the ground plan, except such warehouses are divided by one or more party walls into divisions of not more than 35 squares each, and any communications made through the party walls are to have door cafes and fills of stone, and iron doors. Stables are only to contain 25 squares in one division, with the same regulations.

Cap. 55. If any building of the first, second, third, or fourth rates, (except the mans of court or chancery, the royal exchange, company halls, and except warehouses and dwelling houses, let at a rack rent for not more than 25 pounds by the year,) shall be converted into two or more dwelling houses, work-shops, stables, or other buildings which shall be in distinct tenures on the ground floor, then each such tenement shall be considered as a separate building, and be divided by party walls.

Cap. 59. No iron, tin, copper, or other pipe or funnel for conveying smoke or steam, is allowed to be in front of any building next to a public street, nor in the inside of any building near than 14 inches, to any timber or other combustible material.

Cap. 62. The mayor and aldermen of the city of London, and the justices of the peace for the county of Middlesex, Surry, the city of Westminster, and the liberty of the tower of London, are empowered to appoint surveyors to see the rules and regulations of this act properly complied with: and cap. 63, before any building is begun to be erected, the master workman is bound to give 24 hours notice thereof to the surveyor of the district, in which the building is, who is to attend and view the building, and enforce the observance of the act. The fees to be paid by the builder to the surveyor are, for a building of the first rate 3l. 10s., and for an alteration or addition to the same 3l. 15s.; for a building of the second rate 3l. 3s., and for an alteration 3l. 10s.; for the third rate 2l. 10s., and 1l. 5s.; and for the fourth rate 1l. 15s., and 1l. 15s. for the building, Ship. See Ship.

BUILT, in Sea Language, is an epithet applied to ships, denoting their peculiar form and structure, and distinguishing some of others from a different class or nation. Thus we use frigate-built, galley-built, &c. English-built, French-built, &c.

BUILTH, or Buallt, in Geography, is a market town of Breconshill, Wales, finely situated on the banks of the river Wye, over which there is a handsome stone bridge. According to some antiquaries, here was the Roman station which Ptolemy calls Bullemum Shurum. Several intrenchments are still remaining in the vicinity of the town, and some Roman bricks, inscribed LEX: II, have been found here. The Chronicle of Caradoc relates, that the Danes, in 803, who had been vanquished and harassed by Alfred, fled to this part of the country, and, among other devastations, nearly demolished the town of Built. It was, however, again rebuilt and fortified with a strong castle, and again suffered a nearly similar fate, in 1217, by Reynold de Brute, who then broke off his alliance with Llewelyn ap Jarwerth, and united with Henry III. In 1221 he was beggared in this fortress by a party of Welsh lords; but Henry, to whom he had remained constant, came with an army and raised the siege. About 1256, we find this fortress in the possession of Rhys Fychan, whom Llewelyn ap Gruffyd defeated and forced...
forced out of Bulih. In various other wars between the English and Welsh, this place was alternately occupied by the conquering power, and in each conflict experienced some damage.

This town is singularly built on two parallel terraces, and faced two streets, on the side of a steep declivity. The upper street is clean and respectable, but the lower, and more populous street, on the banks of the Wye, is narrow, and most of the houses have a poor and mean appearance.

Bulih, from its contiguity to Herefordshire, and from the combined attractions of its salubrious air, grand and interesting scenery, and the quality of its waters, is much resorted to by druggists. It is provided with two weekly markets, and three fairs annually. Bulih is 117 miles N.W. from London, 15 from Bucknock, and contains 994 houses, and 5159 inhabitants.

About one mile N.W. of Bulih is a celebrated mineral spring, called The Park wells; and about seven miles N.E. is Llandinidol wells, consisting of three springs. These waters are esteemed of highly medicinal qualities, and are recommended by the faculty in many disorders of the human frame. Dr. Lindon has written a treatise on their peculiar properties. These wells are situated on a common, on which are a few scattered houses, and a large building for the accommodation of those who visit them. The wells of Llandinidol, which are similar in quality to those of Llandinidol, lie on the other side, at no great distance from Bulih. Malkin's Tour in South Wales, 1804. Evans's Cambrian Itinerary, 1805.

BUINAH Point, a cape on the west coast of Ireland, being the southern point of the entrance into Newport or Clev bay, in the county of Mayo. Near it are some rocks and a ledge which require the attention of mariners. In some nautical books it is called Runinaha. W. long. 9° 45'. N. lat. 53° 45'. McKenzie. Beaufort.

BUINSK, a town and district of Russia, in the government of Simbirsk, seated on the river Sviaga; 36 miles N.N.W. of Simbirsk.

BUIS, I.e, a town of France, in the department of the Drome, and chief place of a canton in the district of Nyons, 24 leagues S.E. of it, and seated on the Oreze. The town contains 2215, and the canton 8032, inhabitants; the territory comprehends 325 square miles and 24 communes. The district called Buis, before the revolution, was a territory of Dauphiny, small and mountainous, but moderately fertile.

BUISKOI, a town of Siberia, 56 miles S.E. of Nertchinsk.

BUITRAGA, a small town of Spain in New Castile, seated on a rock, which is fortified both by art and nature.

BUKANS. See Bugganz.

BUKARI. See Buggari.

BUKI, a town of Poland, in the patalinate of Kiov, 44 miles south of Bialacerkew. N. lat. 49° 25'. E. long. 50° 28'.

BUKO, a small town of Germany, in the ancient duchy of Mecklenburg, called New Boku, by way of distinction from Old Boko, a neighbouring church village.

BUKOVITZE, a town of Croatia; 14 miles S.E. of Carlstadt or Carlowitz.

BUKTARMINSKOI, Mountain, a branch of the Altay mountains of Russia, which commences in the superior region of the river Bukterra, at the frontier heights between the Cevene and the Russian empire, declines from the north towards the north and west, accompanied the fore-mentioned stream, on both its sides, till its confluence with the Irrith. It reaches to east and north-east as far as the mountains that run along the Kokusan, and towards the north up to those that follow the course of the Uba. From the Bünkoi snow mountains up to the head of the Uman, which falls into the Kookusan, it forms a lofty ridge, rising almost throughout in high summits of snow, and on this side extends its greatest height to the source of the last-mentioned river. This huge mountain, as yet little known, and partly inaccessible, confines, as far as it has been examined, in its highest points, of various kinds of granite, porphyry, and fand breccia. But in its chasms, and particularly towards the shore of the main or most considerable rivers, different sorts of schistus, slide-bene, marl, breccia, and sand-flone are frequently met with. Jasper is found in abundance, with porphyry and sand, in the superior regions. Of the chalk mountains seen in the lower confines of the Bukterra, some are very craggy, and have a number of caverns. In these mountains there has hitherto been explored but one mine, the Buktarminflioi, with any hope of success. See Alsikai.

BUKUKUNSKOI KAMEN, a fortress of Siberia; 120 miles S.W. of Doroninik.

BUKUPIENICK, a town of Poland, in the patalinate of Lublin; 22 miles S. of Lublin.

BUL, in the Hebrew Calendar, the eighth month of the ecclesiastical, and second of the civil year, since called Mashevan; it answers to our October, and has nine and twenty days.

Bul, in Ichthology, one of the English names for the common flounder.

BULAC, in Geography. See Boulac.

BULACAN, a small province of the island of Luzon, or Manilla, lying between Panagunda and Tondo. It abounds in rice and palm-wine.

BULACH, a town of Swisserland, in the canton of Zuric, and a prefecture of the same name, which first entered into an alliance with Zuric, in 1407. The inhabitants are Protestans; and the town contains 8 miles N. from Zuric. N. lat. 47° 25'. E. long. 8° 27'.

BULACH, a town of Germany, in the circle of Swabia, and duchy of Wurtenberg. In the annexed bailiwick is a mountain, which furnishes iron and copper ores; 20 miles W.S.W. of Stuttgart, and 4 S.W. of Calu.

BULAFO, a musical instrument, much used by the Negroes of Guinea, &c. It consists of several pipes made of hard wood, set in order; which diminish by little and little in length, and are tied together with thongs of thin leather twisted about small round wands, put between each of the pipes, so as to form a small interference. They play on it with sticks, the ends of which are covered with leather, to make the found less harmful.

BULAKUAN, in Geography, a remarkable caille in the empire of Morocco, situate on the banks of the Morbeys, in the province of Duquilla. It stands in a wild and barren spot, on the summit of a commanding eminence more than 260 feet high, and forms a pyramid, with rounded angles; and a large river runs beneath it, which, from its depth and rapidity, inspires a kind of horror. This caille was built at the close of the 15th century, by Muley Abdalmomen, the first king of the race of the Moahedins; but many additions were made to it by Muley Abdallah, son of Muley Ithmah. This prince caused fabulous passages to be dug at a great expense for procuring water from the river; and in order to secure his water-carriers from the fire of the musketry, he built conduits, which brought the waters from the neighbouring mountains, the ruins of which are still visible on the road from Bulakuan to Morocco. Near the caille
cable is a village, and another before you pafs the river; each of which contains about 200 houses, or thatched huts, being piles of rough brown stone without mortar. These villages, inhabited by Moors, are exempt from taxes, in consideration of their giving needed assistance in crossing the river. Although the cable stands in a sandy barren situation, the banks of the river below it present to view well-cultivated gardens, with their orchards and vineyards. Each garden contains a windlass and a bucket, for supplying it with water. The only ferry-boat for passing the river near this cable, is a raft, composed, for the occasion, of reeds, to which reeds, inflated with wind, are tied with cords, made of the palm-leaf. This is furnished by several Moors, who, while they swim, guide and support it by their shoulders, in spite of the rapidity of the current. On this crazy craft travellers and their effects are transported. We learn from Livy, that, during the second Punic war, when Hannibal went from Spain to Italy, a part of his army passed the Rhone, the Ticino, and the Po, on goat-skins filled with air. A kind of temporary bridge is constructed for the passage of the emperor, confiding of two thick oar cables, fastened to large piles on each bank of the river. These cables are formed into a kind of hurdle, by passing through them iron flake about 5 feet long, and laying upon it 6 inches thick.

Chenier's Prefent State of the Empire of Morocco.

BULAM, or BOULAM, an island in the Atlantic, near the coast of Africa, at the mouth of the Rio Grande, a league from the continent, and about 18 leagues long, and from 4 to 5 broad. N. lat. 17°, W. long. 14° 50'. Some have considered it as one of the Bissagos isles. See Bissagos. The whole coast of this island is described as bordered with woods, beyond which the country is singularly fertile, rich, and beautiful. It was formerly uninhabited, and cultivated by the natives of the other islands, who visited it in food-time and harvest, and returned home for the rest of the year. It was found to be abundantly productive of rice, maize, millet, fruits, and roots. The ground is said to rise imperceptibly from the shore for the space of 2 leagues, thus exhibiting a most agreeable prospect. This aspect serves as a base to higher mountains, which stand in the centre of the island, covered with fine wood, and separated by beautiful vallies, with such regularity, that nature would seem to have been improved by art. This island was recommended, long ago, as the commencement of the last century, by M. da la Brue, to the French government, as a fit place for a settlement; and the advice was repeated, in 1767, by the abbé Domenet. However, during the year 1791, a society was formed in London for establishing a settlement on some eligible spot on or near the coast of Africa. Thos. who formed this association, allured by the flattering information which they had received of the island of Bulam, fixed on this as the object of their deliberation. The subscribers were to receive a grant of 500 acres of land for the sum of 30l. and in that proportion for any greater or less number of acres, as far as 2000. In the space of one month after opening the subscription, 5000l. were paid into the hands of trustees. After having encountered various difficulties, the adventurers arrived at Bulam, and immediately took possession of it by hoisting the British flag. The natives unexpectedly attacked the new-comers; killed some of them, and obliged the others to relinquish what they had obtained. Accordingly, as they were thus compelled to abandon it, they fought for refuge in a settlement belonging to the Portuguese, where most of the unfortunate adventurers became victims to the climate of the country. Mr. Montefiore, who was a principal agent in this business, depairing of the colonization of Bulam, embarked for Sierra Leone, of which he gives a very favourable account. However, from another account, compiled from the records of the Bulam society, we are led to entertain a more favourable opinion of the situation and prospects of this colony. Mr. Beaver, who resided at Bulam as chief in command, in a letter dated July 1793, expresses great confidence of the final success of the undertaking; declaring that, with sufficient support (not military; every thing having been fairly purchased, and amicably settled with the neighbouring Africans) "not one-tenth part of what had been allotted to the Sierra Leone company," he could, long ago, "have added to our present territories land sufficient to maintain 200,000 people, and at very little expence." He concludes his letter, addressed to the trustees of the Bulam society, observing, "that if the good people of England knew but one half of the advantages to be derived from colonizing this part of Africa, on an extensive scale, you might command half the money in the kingdom." This officer resided at Bulam about two years.

Dr. Chisholm, in his "Essay on the malignant pestilential fever, &c." Svo. 1795, maintains that the yellow fever was originally brought to the West Indies from Bulam in the ship Hanky, on board of which it commenced.

BULARCHUS, in Biography, a Greek painter, flourished 740 years B.C. and is said to have been the first who introduced (at least among the Greeks) different colours in the fame picture.

BULASCHAIA, in Geography, a town of Siberia, on the fourth side of the 1st, opposite to Tobolsch.

BULATMAI, in Tethysigny, a species of Cyprinus, the anal fin of which contains eight rays; the second dorsal fin is large, and not limited: beards or cirri four. Habitus. Cyprinus Burlatmai is a rare fish, of the size of the common carp. The colour is steel blue, glistened with gold above, and silver, shining with a golden hue beneath; the scales are of the middle size, semicircular, dilated, and immersed: flesh white as snow, and very good. This inhabits the Caspian Sea.

BULB, or BULUS, in Botany, a species of plant employed by Theophrastus, sometimes the name of a plant allied to Scilla Alba, and others of the same family, but not particularly ascertained by modern botanists, and sometimes denotes the peculiar kind of root by which those plants are distinguished. In the latter sense it was admitted by Pliny, and other Latin writers, and is preferred in most of the modern languages of Europe. Our English gardeners universally speak of it as a root; and it is said by professor Martyn, in his "Language of Botany," to have been called by botanists, till Linnaeus corrected the error, and shewed that it is a single bud enveloping the whole plant; but Linnaeus was by no means the first who viewed it in this light. Our countryman Grew, in the second book of his "Anatomy of Plants," prefixed to the Royal Society in 1672, says expressly, that "all bulbous roots are, as it were, hermaphrodites, or root and flower both together; for the flowers only are abortive roots; the bulb actually containing those parts, which springing up, make the leaves or body; and is, as it were, a great bud under ground." About the same time Malpighi was engaged in a similar course of study at Bologna, and communicated the result of his researches also to our Royal Society. Under their patronage his "Anatome Plantarum" was published in London, the first part in 1675, and the second, which contains the tract of "De Radicibus," in 1679. He treated the subject more at large, and dissected, described, and figured several of the best known bulbs. In complete agreement with Mr. Grew, he uniformly states the bulb to be a germ or bud, consisting of leaves or coats which enclose the rudiments of the future plant,
BULB.

plant, and produce other embryo buds for its farther propagation and increase. Nor were these great physiologists the first who started the idea. We find it clearly expressed by Clusius, who wrote a hundred years earlier. "Elt ergo tulipa, ut & alarum bulbosum tunicatum, bulbus nihil aliud quan gemmae grandis subterranea, quae prius adnatas externas intra fe conceptum alium bulbum fec gemmam, qui natura bulbosorum etiam videtur, cum revera non fit, fed diversis in pulchrum foibole; cuncta intra ipsum bulbum conceptus & externus fit, adnatis extramus grandior & habitior evadit, ipsique parentis zomusus." Even in the time of Theophrastus, as we learn from his "History of Plants," lib. i. cap. 10, it had been disputed whether a bulb is properly a part of the root: a question which the venerable botanist, after flating the arguments on both sides, finally resolves in the affirmative, on the general principle, that roots are capable of appearing under different forms, and that all which is under ground belongs to the root. It appears, however, that, at so early a period, there were some who compared the bulb to the xyurn, xyurn, or cyuma, the flabby part of the stalk of a cabbage, when it first rises above the surface of the ground; and, if we admit the proposed reading of one of the commentators, others went so far as to call it \\textit{ovum}, \\textit{oculus}, an eye, or gem; but the conjectural restoration of a passage so corrupt in the manuscripts as to be confinedly unintelligible, cannot be brought forward to establish a fact in the history of science. Since the publication of the Philosophia Botanica, no doubt has been entertained on the subject; the botanists, as well as others, still speak of bulbous roots: nor can any material objection be made to the continued use of the term, if it be understood to mean a bulb-bearing root, or as it is accurately expressed in the Terminii Botanici, "radix bulbo instruxa." 

Gems and bulbs are somewhat quaintly, but not unaptly, styled by Linnaeus, hybernaeula, the winter quarters of the young, or rather embryo plant; and they belong respectively to different families of the vegetable kingdom. They are distinguished from each other by their situation, and by such differences in their form and texture as their peculiar circumstances require. In the Systema Naturae, a gem is said to be an hybernaeulum seated on the ascending caudex; and a bulb to be an hybernaeulum seated on the defending caudex: in popular language, the former is above, the latter beneath the surface of the ground: i.e. the gem is a stem-bud, and the bulb a root bud. In the Terminii Botanici of Elengren, published in Amoenitates Academicae under the eye of Linnaeus, the distinction between them is taken, not from their situation, but their substance. A gem is there said to consist of the rudiments of future leaves; and a bulb to be the rudiment of those which are past. In this definition the great naturalist, for to him it must ultimately be attributed, even allowing the general principle to be true, has sacrificed clearness, if not propriety of expression, to his characteristic love of antithesis. The rudiments of future leaves require no explanation: but the \textit{rudimentos} of those which have \textit{perished}, it is not so easy to understand. He undoubtedly meant the remains of what were once the rudiments of the leaves; and which, sheltered by the surrounding earth, have not been entirely destroyed, though considerably changed in their appearance, by a change in the temperature of the air. Or as it is stated by Ferber in the dissertation entitled "Propepi Plantrum," published also in Amoenitates Academicae, \"bulbus a gemma in eo folium differt, quod bafes foliorum perifentia a copioso fucco, quem e terrae haumeant, fiant canae, \& nova folia fuis gemmis instructa excrecent intra priorum bafes. Non confundt debent bafes foliorum præteritorum cum follis futuræ plantæ; illas enim haud altere considerare oportet, quam ut quas gemmarum exteriores ab aere vel frigore imbruatæ.\"

It is natural to inquire how the remains of leaves which in their perfect state were above the surface of the ground, have been drawn down so as to become the scales or coats of subterraneous bulbs. To account for this, Linnaeus must have adopted, though we do not remember that he has quoted, the theory of the old botanists concerning the gradual descent of the caudex, supposed to be produced by the mechanical action of the radicles or firing roots, which, to borrow the homely language of Grew, \"defending themselves directly into the ground, like so many ropes, lug the trunk after them.\" This idea is mentioned by Dr. Darwin in his Phytologia with some degree of contempt, and passed over without a formal refutation as the unfounded doctrine of \"some inaccurate observers.\" Without presuming to detract from the exalted authority of Grew, who certainly ought not to be ranked with the tribe of inaccurate observers, we may venture to intimate that the inferences which form what may be called the body of the bulb, are not in all cases the remains of decayed leaves, but have been originally formed below the surface, and have never advanced beyond their present appearance. In this point of view they have actually been represented by some of the disciples of Linnaeus under his immediate instruction; as appears from Leelings' dissertation \"De Gemmis Arborum in Amoenitates Academicae.\" \"Bulbos diximus," says that writer, \"nihilo aliud esse, quam gemmas, cum codem modo ac ille inulant intra fe futurum plantam; fed eorum tumici evantur succulentae a copioso nutrimento, quod haumeant e terræ cui inasangatur, quo repleti non pollut amplius extendi;\" i.e. bulbs, we have asserted, are no other than gams; for like them they include the future plant, but their coats are rendered succulent by the copious nourishment which they draw from the earth, and in consequence of this reflection become incapable of farther extension.

Of these two concise definitions of a bulb, that given in the Philosophia Botanica is evidently inaccurate: since it is so expressed, as to include the root buds of perennial herbaceous plants, called by some authors, but not by Linnaeus, turions; which have not the form, and have never been known either in popular or scientific language, by the name of bulbs. That in the Terminii Botanici, as we have seen, deficient in perspicuity; and when properly explained, does not appear to possess sufficient precision. Bulbous plants are defined by Mr. Ray to be those which consist of a single tuber or head, either scaly or tunicate, throwing out numerous fibres from its base. In this definition our great countryman should not have introduced the word tuber; for in the preceding sentence he has expressly divided the flabby roots which swell laterally, into bulbous and tunicated. A bulb, therefore, and a tuber, were, in his ideas, as we believe them to be in nature, different things.

A bulb is now universally understood to be a species of bud of a peculiar structure suited to its situation on the plant. A bulbous root consists of this bud, of the proper radicles, and of the intermediate caudex. A tuber, if we mistake not, is a radicle, swollen, either wholly, or in part, to an extraordinary thickness, and having generally, if not always, imbedded within its substance the rudiments of one or more future buds; as in the well known root of the potato, solanum tuberosum. See \textit{Tuber}. 

Bulbs are divided by Linnaeus, in his Philosophia Botanica, into four kinds, the squamous, the tunicated, the solid, and the articulated.

The squamous bulb consists of imbricated lamelles; i.e. of scales laid partially one over the other, like the tiles or slates
flats on the roofs of buildings, but more loosely connected, and a little diverging at their points; as in several species of lily. The root of the white lily is described and figured by Malpighi in his "Anatome Plantarum." It is composed of scales, or, as he calls them, leaves, gibbous without, and a little concave within, so adapted to each other as to form a bulb. These scales proceed at different elevations from a solid elongated body, luted by Malpighi a radical trunk, the developing caudex of *Linnaeus*, which sends out from its base a number of compound radicles, and from its upper extremity, within the scales, the root leaves and stem of the plant. The tunicated bulb consists of numerous tunics or coats, as in the common onion, allium cepa. These coats lie close together in concentric layers, and proceed from a short broad caudex, having its upper surface more or less convex. They envelop at their centre the embryonic plant of the ensuing season; and between them, at different distances from the centre, other bulbs, called caseyux by the French naturalists, and offsets by English gardeners, for the future increase of the species. The solid bulb is said by Linnaeus to consist of a solid substance, and the tulip is given by him as an example: but he must be understood to speak comparatively, not strictly and absolutely. The tulip root is thus described by Dr. Darwin in his Phytologia: "In the tulip root diffused in the early spring, just before it begins to shoot, a perfect flower is seen in its centre; and between the first and second coat, the large next year's bulb is, I believe, produced; between the second and third coat, and between this and the fourth coat, and perhaps further, other leaves and bulbs are visible, all adjoining to the caudex at the bottom of the mother bulb; and which, I am told, require as many years before they will flower as the number of coats with which they are coated." It is evident from this description, that the bulb of the tulip is as really coated as that of the onion. Indeed it had been arranged by Mr. Ray among the tunicated bulbs long before the time of Linnaeus. It differs only in having its coats more fleshy, and less easily separated from each other: characters found in a still greater degree in several other bulbs which are, nevertheless, by no means truly solid. It appears to us that no proper bulb is or can be so. If we adhere to the idea given of it by Linnaeus, as a kind of hypanthecum, or winter quarters of the embryo plant, it must have a space within it for that purpose: it must also, as we conceive, have coats or coats, within which caseyux, or offsets, for the future increase of the plant may be formed. The bulbs which have been called solid, have coats, either comparatively thick, and so closely compacted together, as, on a slight inspection, to resemble one indistinguishable mass; or, so small and few, as to be exceeded in bulk by the full grown caudex. Hence has arisen the difference in authors with respect to their distribution of this kind of root. The bulb of the crocus, for instance, has so doubtful an appearance, that Mr. Ray, in his "Historia Plantarum," has placed it among the tuberose roots; but our great naturalist would not have so classed it, had it pulsed under his eye in an early stage of its growth, when it is clearly tunicated. It is considered by Philibert in his "Introduction a l'Etude de Botanique," lately published at Paris, as a mixed bulb, or rather a tunicated tuber. "In the bulb properly so called," says that acute naturalist, "the caudex is less in bulk than the tunics, and the rudiments of the stem embraced by them: in the tunicated tuber the caudex is more considerable; and in the pure tuber, the tunics are entirely wanting." "Thus," continues he, "in the crocus are found only two or three tunics, which are finally lengthened into a spathe, and closely embrace the leaves implanted on the caudex; whereas, in the true bulb the leaves are surrounded by a great number of tunics which never increase in length. Take up a crocus some time after it has flowered, and you will find that the exterior coats are destroyed; the caudex is naked, and several small bulbs appear sealed on its convex face; or, as it is somewhat ambiguously expressed in the original, le caudex en a découvert: & fur plusieurs de ses points, vous remarquez de petits bulbules, nains de la tubérose même du caudex." It seems evident, from the latter part of the sentence, that this ingenious writer, in the present case, confounded the tuber and the caudex, which are, in fact, always distinct parts of a plant; and was thence led to give the root of the crocus a character which it does not possess. This root has nothing about it equivalent to a tuber but it is firmly bulbous, and, like that of the onion, consists of proper radicles, a caudex, and a tunicated bulb. The only difference between them arises from the relative proportion of the caudex and the tunics: a difference which, though sufficiently obvious in the extremes, may be lost in such gentle gradations, as to render it impossible to draw a line of distinction, and which therefore cannot be received as a specific character. In the instance before us, it exists, we believe, only in those bulbs which have arrived, or are nearly arriving at maturity, and are about to produce flowers. We this day, March 12th, dissected a young bulb which had produced leaves above ground, but would not have flowered during the present year. Its coats bore a considerable proportion to the caudex, and contained within them, distinctly formed, two new bulbs, each enclosing an embryonic plant, furnished with the rudiments of its future leaves. An older one, in flower, examined at the same time, was, to all appearance, completely solid, with the exception, however, of the usual thin, brown, dry, and boisterous envelopes, which were, doubtless, the shrivelled remains of the former coats. All the rest was the proper caudex, greatly increased in size, and having on it, at different distances from the central flower-flask and leaves, two caseyux, or offsets, seated on its naked surface. Each of these offsets consisted of an apparently new and very small caudex, springing from a shallow concavity in the surface of the old one, and of numerous coats much exceeding their proper caudex in bulk, and all extended either into the feathers, the leaves, or the spathe of the future flower. Another mature plant had two flowering stems proceeding from two bulbs, so closely connected together as to resemble one, but separated near the top by the usual brown membranous coverings. These bulbs were, doubtless, formed in the same season, and within the same coat of the parent bulb, on opposite sides of the flowering bud of the preceding season; and appear to have so far exhausted the caudex, though now arrived at its full size, as to render it incapable of producing any more offsets. The bulb of the common corn flag, described and figured by Malpighi, approaches still nearer the naked developing caudex, or what has been improperly called the solid bulb. It was considered, indeed, by this eminent naturalist as a tuber, consisting of homogeneous matter collected into one continuous substance: but it is evident, from his description, that it has the characters of a true bulb. The external surface of the tuber or bulb, says he, "stripped of its scaly and involucres, presents to the view various gemmae: and a little below their origin, leaves, as usual, break out, which, being plucked off, leave fragments of their stalks, as represented in his figure, and give to the whole the appearance of a trunk or stem."
The root of the orobanche, figured and described by the same author, is of a more dubious nature. In the first place, it does not belong to the monocotyledinous division of plants, in which the legitimate bulbous plants are usually, if not always, found. In the next place, it produces on its surface scattered gem, each supported by an external, caduceous leaf; some of which gem springs also from the stem, or ascending cædax. We presume, therefore, that it may be a fending cædax, with germ-bearing leaves, analogous to those of trees and shrubs. It may be proper, however, to remark, that Bernard Jaffenci, as we learn from La Mareck's "Flora Françoise, Discours Preliminary," p. 54, placed in the royal garden at Trionon, orobanche, lathrex, and some others, in the division of the monocotyledinous plants. Anthony Jaffenci, on account of their having both a calyx and a corolla, and their evident affinity to other dicotyledonous genera, has judged them to be dicotyledinous. What induces his illusion to think otherwise we are not told. The parasitical growth of all the species of orobanche renders it difficult to ascertain in what manner they spring from the seed; but the disposition adopted by so eminent a botanist, and the description of the root given above from Malpighi, seem to indicate something of a monocotyledonous character, and afford ground for a conjecture, that in these plants a connecting link between those great natural divisions may be found.

The root of the common turnip (brassica rapa) which has been called a bulb by many writers, though not by Linnaeus, is nothing more than an intumescence of the descending cædax, produced by a luxuriant foil; and most generally the effect of cultivation, differing from the cultivated carrot (daucus carota), which no one ever thought a bulb, merely in form. Neither of them has any claim to the character of an hypernucumal.

The articulated, or jointed bulb, confius of lamelle or scales, linked or chained together; such as are found on tuberosum moxchate (adoxo moxchatella), the greater toothwort (lathrex tuberosa), and bulbiferous coral-root (den- taria bulbifera). The only instance of this kind of root given by La Mareck, is that of white faxifrage (faxifraga granulata), but he thinks it should rather be ranked with the tuberosus than the bulbous roots.

Ventricat, in the "Botanic Dictionary," prefixed to his "Tableau du Regne Vegetal," confines the term bulb to those which are strictly tunicated or coated, among which, as we have seen, those folid by Linnaeus ought to be placed; and has ranked with the tubers universally so called, (such as those of the common potato), the globular root of the turnip radish, (a variety of raphanus fativus), intending, doubtless, to include the common turnip; the fcaly root of the lily; the knotty root of the common dropwort (spirea ficipenda); the articulated root of tuberosum moxchatel; the falciculated root of aphedonius lutosus and eruciaceus; the graminous root, of the garden ranunculus (R. Alis-ticus); and the heteriform, or diluculent root of several species of orchis. We are inclined to think that this able botanist is right in separating all those from the proper bulb; the essential character of which will then depend on its tunicated structure, and the difference of the species will arise from the various thicknesses of the coats, and the proportion of their whole substance to that of the descending cædax; but the remaining ones are so dilustrous to each other in several important respects, that they cannot, with any degree of precision, be called by the same name.

The true distinction between a bulb and a tuber appears to us to be in their relative situation with respect to the descending cædax. The bulb crowns the proper root, and has the cædax interposed between it and the radicles. The tuber is situated under the cædax, either on the same plane with the radicles, as in some species of orchideae; or, still lower, when it is evidently an intumescence of the radicle itself, as in the common potatoe. Linnaeus, in his practical works, uniformly calls those roots of the orchideae, which answer this description, bulbs; solely, it should be seen, on account of their general appearance; for they are not mentioned under any of his four divisions, and do not correspond with either of the definitions quoted above from the "Philosophia Botanica," and the "Termini Botanicae." That they do not essentially differ from the tuber of the common potatoe, is evident from the folio by which, in different species, they approach that well known and invaluable eculent. In orichis bifolio, pyramidalis, tubiflua, &c. they spring immediately from the cædax along with the proper radicles; in orichis maxilla, orphylo apicera, &c. they swell suddenly from the radicle itself at a small distance from its origin; and in orphylo monarchi, the new tuber is so far from the cædax as to be apparently not different from that of the potatoe. These ferioriform tubers differ only in name from the palmate, falciculated, and aggregate tubers of other species, between which, and those of common pilewort (Rnunculus ficaria), aphedonius luteus, &c. as far as the subject has hitherto investigated, no certain line of distinction can be drawn. All the radicles of orphylo nidos avus, birds-nett orchis, are swollen into tubers. The rare orphylo Loesedi appears to differ from all the rest of its natural family, in having a true bulb. A tuber, therefore, is an intumescence of the radicle, as the turnip, carrot, &c. are of the cædax; and, like them, may possibly be, in some cases, merely a refervoir for the nourishment of the present item, particularly in a droughty season. In this light the singular tubers of spirea ficipenda are confidered by Dr. Smith. But it is more commonly, and as no actual observations have been made on the roots of ficipenda to determine the question, we are rather inclined to think it always a real hypernucumal, having imbedded in its substance the rudiments of one or more future buds in a leaf advanced state than that of the bulb. When the tuber is small, and contains only a single bud, as in several leguminous plants, and perhaps some graffes, it is called a tubericle.

Ventricat is probably correct in placing the grumous root of the garden ranunculus under this head. But the scaly root of the white lily, &c. differs essentially from the tuber in being placed upon the cædax; as it does from the true coated bulb, in having a looser texture; being, in fact, composed of unconnected scales, which, by their concave shape, are so adapted to each other, as to produce the appearance of a bulb. The scales of common wood forrel (oxalis acetosella) are of the same kind, but smaller, and somewhat less compact; those of tuberosum moxchatel have, in a still less degree, the form of a bulb; and in the bulbiferous coralwort the resemblance totally vanishes. They all, we apprehend, agree in having the rudiment or bud of a future plant situated at their axis, to protect which seems their proper use; and if torn off with a small part of the cædax, and planted in a fuitable soil, will readily take root. Radical fibres are indeed plentifully thrown out under the scales of tuberosum moxchatel while they are attached to the parent plant; they are found more sparingly in bulbiferous coralwort; and sometimes, as appears from Malpighi's figure, occur in the white lily. Roots of this kind seem to form a connecting link between the true tunicated bulb, and the proper bud or gem of the ascending cædax in trees and shrubs. The greater toothwort, having no other radicles, is, we conceive, rather allied to the orphylo nidos avus; and in this...
this opinion we have the satisfaction to find that we are sup-
ported by the authority of Dr. Smith. See English Botany, p. 50. The granules of the white fastigium, which Linnæus calls stem-bulbs, though he has constructed his definition of the term bulb so as to ex-
clude them. They are placed either in the axils of the leaves, as in lilium bulbiferum, dentaria bulbifera, &c.; or on the common receptacle of the head of flowers, as in sev-
eral species of allium; or, within the calyx, instead of a pro-
per seed, as in polygonum viviparium. Botanists have paid little attention to their natural history; and have, for the most part, done nothing more than announce their existence. We know not that any inquiry has ever been made, whether those which are found in the three very different situations just mentioned are precisely of the same nature and structure, or whether they do not so far differ from each other as to render it expedient to give them distinctive names. It ap-
pears, from Dr. Darwin's description of what he calls the
summit bulbs of allium magicum, that in every thing but
situation they are exactly similar to the root bulb of that and other kindred plants. "In cutting one of them hori-
izontally," he tells us in his Phytologia, "I observed three
young bulbs inclosed in the concentric fleshy membranes of
the summit bulb in the following manner; five thick, fleshy,
concentric coats of the general summit bulb being taken
away, there appeared one fingle naked small bulb; and on
the sixth coat being removed, two other bulbs became visible, which were included in it." A philosophic view of
all the different methods in which plants are propagated
without the intervention of an impregnated germ; and of
the order in which they are connected together, so as to
form a regular gradation from the germ or proper stem-bud
to the tuber of the common potatoe and the tubercles of
vicia, lathyrides, and many other plants, is one of the
numerous desiderata in vegetable physiology. The history
of bulbs alone would require a long course of experi-
ments.

BUL, in Vegetable Anatomy. This term is commonly
applied to the enlargements of the roots of many herbaceous
plants, which are therefore said to possess bulbous roots. See
Bulbous Roots. The true bulb, however, does not in strict
ness constitute any part of the root, but in its structure and
uses bears a perfect analogy to the bud. See Bud. Bulbs are
in some instances met with in the axillo of the leaves, as in
the lilium bulbiferum, and even in the flower itself, in many
species of allium and agave; but their most usual situation
is upon the root. It is there that they are found in the
hyacinth, tulip, the lilies, the common onion, and a number of
the herbaceous monocotyledons. The root in all these in-
stances is an irregular circular plate, from the lower part of
which proceeds a tuft of the fine or fibrous roots; the upper
part fulfills the bulb.

The bulb is composed of a number of lamine, which are
placed one upon another; and contain in their centre the
embryo of the plant.

When the lamine have not been exposed to the air, they
are thick, and loaded with juices, are generally of a white
colour, and contain chiefly of parenchyma, in which there are
spread some fibres, forming nervures. They resemble very
much etiolated leaves.

When the bulbs have been removed from the earth, and
kept for any length of time in an open and dry situation, the
external layers shrink up, become thin and glossy upon the
surface, and often acquire a brilliant metallic colour.

The lamine in the onion, hyacinth, tulip, and many others,
are covered of circular tunics, the one entirely enveloping the
other; but in the lilies they assume the form of scales, and
more exactly correspond with the covering of buds. See
Plate II. in Vegetable Anatomy; fig. 18, gives the bulb and
root of the onion; a is the bulb, which has the superior part
cut off to bring it into view the concentric layers of which it is
composed; b indicates the circular plate forming the com-
mon centre of the fibrous roots, which are marked by c.
Fig. 19, of the same plate exhibits the bulb of a lily, which
is made of thick imbricated scales; from the base which sup-
ports the scales the fibrous roots take their origin.

The bulby lamine, which constitute the great mass of
all bulbs, are analogous to the scales of the bud, and, like
them, serve to protect the young plant or flower from all
external influences, until the embryo attains a certain degree
of development, or becomes vigorous enough to be nourished
by its own independent actions. The embryo in the bulb,
as in the seed and bud, is always formed in the year pre-
ceding its evolution. Thus we may clearly discern in the
bulb of the tulip, as early as the month of August, the linea-
ments of the flower which is to make its appearance the en-
tering April. See Plate II. of Vegetable Anatomy. Fig. 22,
represents a bulb of the tulip, cut down through the middle in
the month of September; a e the various investments of the
bulb; b c the innermost tunics, thinner than the rest, and
containing the young flower; e the embryo tulip, implanted
as it were in the circular root, which serves as the basis of
all the parts of the bulb; d the circular plate, or common
radicle.

As bulbous plants do not produce buds in the axillo of their
leaves, the circular root, which supports the bulb, gives origin
to small bulbs, which are in many respects analogous to the
lateral bud. They exist, like them, for a certain period in
an immature or embryo state, inclosed by the leaves or tunics
of the parent bulb. They are formed in many species at the
commencement of the season of vegetation; when they be-
come apparent, they are as small as a grain of corn; they
increase at first slowly, but afterwards they grow with
rapidity, and when the flower is ready to blow, they acquire
fibrous roots preparatory to their detachment from the
parent bulb. When the root-buds approach maturity, the
bulb, from whence they arise, ceases to vegetate, and ulti-
mately dies and rots. It is in this manner that the root of a
tulip becomes apparently removed from its situation, the
original bulb being replaced by others which produce the
flowers of the following year.

There are some bulbs, as those of the hyacinth, which fur-
nish, for several years, the lateral bulbs or root-buds; but in
these cases it is only at the end of two or three years that
the small bulbs attain the magnitude of the original one. If,
however, they are detached during the first year, they will
grow independently of the parent bulb, which in this case
does not perish, but continues to exist for several years, and
to produce new effects.

Bulbs, like buds, may be distinguished into leaf bulbs and
flower bulbs; as an example of which, let a seed of tulip be
fowm, it produces in the first summer a plant, which dies in
the autumn, but leaves in the earth one or more bulbs. These
afford stronger plants, the ensuing spring, than those of the
first year, but which do not yet bear flowers. They also
perish in the autumn, and leave behind them other leaf
bulbs, strong or more perfect than those of the preceding
year; and a succession of leaf bulbs is thus generated for four
or five years, until at length the bulb acquires sufficient
vigour for seminal generation; and then it produces, in its
place, a large flower bulb, surrounded by several leaf bulbs.
BULBINE, Plinius, in Bestzey. See Hyacinthus com-
mosus.

Bulbine, Hort. Clf. See Anthericum frutescens
and aloides.

Bulbine, Gmel. See Crinum asiaticum. Gert-
ner's crinum is the agapanthus of 'Hercutier, Schreber, and
this dictionary.

Bulbocastanum, C. Bauh. Townefort. See
Bunium.

Bulbocastanum, bulboi. C. Bauh. See Chero-
phyllum bulbosum.

Bulbo-cavernoi, in Anatomy. See Accel-
ratores urinæ.

Bulbocodium, in Botany. (from Bolsc a bulb, and
Gen. char. Cal. none. Cor. six-petalled, funnel-shaped;
claws very long, linear; throat connecting the petals;
petals lanceolate, concave. Stam. filaments six, awl-shaped,
inferted on the claws of the petals; anthers incumbent.
Pet. germ ovate, awl-shaped, obtusely three cornered, su-
prior; style thread-sided, the length of the filaments; ligmas
three, oblong, erect, channelled. Peric. capsule triangular,
acuminate, angles oblique, three-celled; seeds num-
eros.

Obs. It has sometimes only four flaments and four
petals.

Spec. B. vernum, La March, Iluifl. Pl. 230. (Colchicum
three, lanceolate, enveloped in their lower part by a
thin membranous sheath. Flower little, if at all longer
than the leaves, white at first, but afterwards acquiring dif-
cent shades of purple, rising almost immediately from the
root; borders of the petals arrow-shaped, and their narrow
acuminate segments fo fitted to each other, and so closely
connected, as to give the whole the appearance of a mono-
petalous corolla like that of colchicums. Stamens shorter
than the petals. It flowers early in the spring, and has the
general appearance of the crocus, from which it differs in the
number of its flaments, as does from colchicum in hav-
ing only one style. Lam. Encyc. and fig. A native of
mountainous situations in Spain, the south of France, and
Ruffia. It appears to have been cultivated in England by
Parkinson, so early as 1629, but is now become very rare in
our gardens, its bulbs being tender, and not much inclin-
ed to increase. It may be propagated by offsets like other
bulbous rooted plants, removed soon after the leaves decay,
but this should not be done more than once every three
years. It may also be produced from seed found in the lat-
er end of September, or any part of October, in pots filled
with fresh loamy earth, where they should remain, only va-
rating the tuition according to the season: till the next
summer but one, when as soon as their leaves are de-
cayed, the roots should be taken up, and planted in the bor-
ders of the flower garden. Miller.

Narcissus and N. minor.

Bulbocodium, Raim. ang. See Anthericum seroti-
num.

Bulbocodium, gracium, Town. See Anthericum
gracum.

Bulbocodium, croceifolium, Town. Mil. Icon. See
Ixia Bulbocodium.

Bulbous roots, in Gardening, are such roots as are
composed of bulbs, and which differ essentially from the tu-
herous roots, which consist of an entire solid fleshy substance.
Under this head are comprehended some eulent plants,
such as garlic, onions, leeks, shallots, &c. and a numerous
train of flowery plants, mostly herbaceous perennials, pro-
ducing beautiful flowers, many of them being hardy enough
to succeed in beds and borders in the open ground, and
others in the flower or greenhouse. The principal of the
flowery tribe belong to the following genera: the amaryllis,
including the Guernsey lily, bell-donna lily, Jacobean lily,
&c.; nareiffus, or daffodil, including jonquils, hyacinths,
tulips, frutillaria, and crown imperial lilium, or common
lily, including martagon, ornithogalum, or star of Beth-
lehem; galanthus, or the snow-drop; leucojum, or great
snow-drop; fliella, or fia onion; colchicums, or meadow saf-
tron; alliucia, or bafard star of Bethlehem; muscaria, or
musk and grape hyacinth; iris, the bulbous and perian,
baconnatus, or blood flower; allium, or moly; crocus,
including spring and autumn kinds; bulbocodium, and paen-
trium, or sea daffodil. The different species and varieties
of which are seen under their respective genera.

Bulbous roots may in fact be said to be annual or bien-
nial, as the fame individual root lasts for a certain time only,
in some, not more than a year after having attained a flower-
ning stalk; in others, longer, as previous to their dilution,
they afford from their sides a supply of suckers or offsets to
perpetuate these respective kinds, so that at the end of many
years, what is still often considered as the same individual
root, is in reality another. All bulbous rooted plants re-
nov their leaves and flower flems annually; and their prin-
cipal season for flowering are at different times during the
spring and summer months, some producing their flowers at
one time, and their leaves at another, as in some species of
amaryllis and colchicum; others produce their flowers and
leaves together, as in the hyacinth, tulip, narcissus; and the
leaves and flower flems of all the forpest perished annually at
a certain period after flowering, after which time, the root
becomes in a state of maturity in respect to its growth for a
few weeks, in which new fibres are prepared for the future
plant. This is the proper time to remove the roots, either to
separate the offsets for propagation for planting the roots in
fresh prepared earth, or for removing them to any other
part of the garden or other ground. And, likewise, for
preferring the bulbs out of ground for autumn and spring
planting, when the beds or borders can be more conve-
niently prepared for their reception; for most forst taken
up at this period may be kept out of ground several months;
or if occasion require, some forst admit of being kept out
of the ground from the time of the flowers and leaves de-
caying, until the following spring, as is often practised
when intended for spring planting, to obtain a longer suc-
cession of blooms by succeeding the autumn planting.

Bulbous roots may, however, remain several years unre-
moved, and when greatly increased by offsets be only taken
up at the proper period to separate the increased progeny,
and replanted again as may be necessary. It is, however,
particularly necessary to take up all the choice kinds of bu-
lbous roots annually to separate the offsets for increase, as
well as to prepare the earth of the beds and borders aforehand,
to promote the beauty and merit of the succeeding year's
bloom, especially for the curious tulips, hyacinths, narcis-
sums, &c. The more inferior sorts of bulbous roots should
also be removed every other, or as often as their offsets are
considerably increased in number, which, if permitted to re-
main so long as to increase into large bushes, cramp each
other in growth, and produce small ill nourished flowers of
little beauty.

All the bulbous roots which have been taken up at the
above
above period in summer, should be chiefly planted, where practicable, again in the following autumn, about October or November, as they flower much stronger than when kept out of the ground till the spring season.

The Rev. Mr. Marshall, in his work on gardening, however, directs that autumn flowering bulbs, when their leaves are decayed, should be taken up in May, and that none of the kinds remain long without being taken up, as they are liable to be cramped and confined in their growth, and of course decline in their beauty.

It is recommended as the best practice with flowering bulbs, to plant the spring kinds in the beginning of the autumn, as in the latter end of September, or beginning of the following month; and those of the summer flowering sorts in October, or the succeeding month; and those of the autumn blow in the latter part of July, or in the following month; too early and too late planting being equally to be avoided, as when put in too soon, they are liable to be injured by being too farward when the winter and early spring proves severe, and when delayed too long they are apt previously to exhaust themselves by forming new root fibres.

Bulbous roots of the lamiated kinds, such as lilies, should not be kept out of the soil longer than six or eight weeks; the summer flowering sorts being set at separate periods in the autumn, and in the beginning of the year before the latter end of February, so as to produce a proper succession of flowers.

With others of the same nature, this method is also common, but they should have dry sandy loam in order to stand the winter without rotting, where there happens to be much wet, succeeded by severe frosts. In these cases, the protection of mats and the hunting of peas may often be found useful. When bulbous roots have remained in the ground longer than the proper period, so as to have struck out new roots, they should always be removed with bulbs of earth, as where this is not attended to, they grow weak. On this account, the exact period for removal should be attended to with great care.

The offsets of bulbous roots should in general be put into the ground a considerable time before the periods of planting out the full sized roots: those from lamiated bulbs mostly requiring to be immediately planted.

The soil most adapted to the growth of bulbous roots, in general, is that of a sandy loam where there is no stagnation of moisture below; many sorts of these roots are not however very difficult in this respect, provided there be not an over proportion of moisture. The ground for them should be prepared by digging it to the depth of six, eight, or ten inches, or more, reducing it well in the operation. After this has been done, it should remain a week or ten days before they are put in to become perfectly settled.

In regard to the disposal of these roots in planting, it is generally for the more large and curious sorts in beds a little rounded, of three or four feet in width according to circumstances; or in patches in the common borders, for the smaller kinds, in clusters of three, four, or five together, according to their growth. With the large sorts, such as the white orange lilies, crown imperial, &c., one in a place is sufficient. The roots of fancy flowering bulbs when planted in beds, are usually put in rows, eight or more inches apart, and from five to seven inches distant, in proportion to their growth. Some prefer less room; but where a strong blow is required, these distances are not too great. Hyacinths should in general have the space of seven or eight inches, and tulips eight or nine, though it is often the practice to allow the former not more than five or six inches. The depths of setting roots of the bulbous kinds, are, in general, according to their sizes or growths, as three or four inches from their upper parts. But some sorts, as the crown imperial, and crocus, will rise from a considerable depth, as six inches or more, and others from still greater, which has induced some persons to plant them to such depths as are sufficient to prevent their being injured by digging over the surface ground; but in such cases, they must be liable to rot in wet seasons.

Different methods are employed in planting bulbous roots, as those of putting them in by the dibble, and in drills drawn by a hoe. The latter is in general to be preferred, as they are apt to lie hollow in dibbling, while by placing them in a drill, they may be gently pressed into the soil, and be perfectly covered up. When they are set in the beds, the best method is to draw off the mould to a sufficient depth on one side, leaving the surface perfectly level, watering it a little in dry seasons, and then forming it into proper squares, placing a bulb in the middle of each, covering them with the mould drawn off, so as to leave the bulbs in an upright position. After the bulbs have been put into the earth, if the weather continue very dry, a little water should be sprinkled over the beds or other places, to forward their vegetation, and prevent their rotting. Some protection is necessary in raising the more curious sorts of these roots, as before they appear during the winter, the beds should be sheltered from too much wet, in order to guard against the effects of frost. And when they first present themselves above the ground, they should have the protection of an awning of cloth, mats, or other contrivances, in the nights when the weather is severe; but they should not remain on in the day time, when it is tolerable. Some sort of covering of the fame sort is also necessary when they are in blow to shield them from the sun and rain, and continue them much longer in a perfect state of flowering.

There is a method of getting spring flowering bulbs forward, which is by setting them in pots or glass flasks for the purpose, in warm rooms, or in moderate hot beds, as by these means, they flower in winter. The hyacinth and narcissus, as well as several others, may be managed in this way with facility. These should be placed in pots of light dry sandy earth in autumn, as about the beginning of October, water being occasionally given. They may likewise be put into glass flasks at the same period, and occasionally every three or four weeks, till the latter end of February, in order to have them flower in succession. In this method the bottom of the bulbs should be just immersed in the water, which should be renewed once a week, or oftener, so as to keep it constantly up to the bottom of the bulbs. Soft water is the best for this purpose. The blow is said, by Mr. Marshall, to be considerably strengthened, by dissolving a portion of nitre, about the size of a pea, in the water each time it is changed.

Besides the raising of flowers from root-bulbs in these modes, there are some produced from little bulbs, forced on the sides of the top parts of the stems, as in the bulbiferous lily. These should be taken off about August, and after being dried a little in the sun, planted out in rows in the nursery in the same manner as the offsets.

By these means the various bulbous-rooted plants may be continued; but, in order to produce new varieties, recourse must be had to seed, which should be carefully saved, when fully ripened, from the bell and most curious flowers; and which, after having been hardened a little in the sun, should be sown in boxes of light rich earth, setting them in sheltered sunny situations, but not under covers. This is usually done about the latter end of August, or beginning of the following month, the seeds of hyacinths, tulips, and other large sorts, being covered to the depth of nearly an inch. A little
BULGAR, a mountain of Asiatic Turkey, in the province of Carmania; 30 miles S. of Cogni.

BULGARIA, GR. "the name given by some geographers to a province of Asia, in Ruffian Tartary, situated beyond the Volga, on the banks of the rivers Kama, Bieblik, and Samara, but now incorporated into the dominions of Russia, and forming part of the government of Caucasus. Its ancient capital was Bulgar, Beloger, Belgar, or Bargar, which lay 30 versts below the mouth of the Kama, and 5 from the Volga; but according to other accounts the Volga flowed by the town. Bargar was first ravaged by the Tartars in 1234, and in 1500 entirely destroyed by the Russians. See Bulgarians.

Bulgaria, Lit. a province of European Turkey, bounded on the north by the Danube and Walachia, on the east by the black sea, on the south by Mount Haamus, which separated it from Romania and Macedonia, and on the west by Servia. It was formerly called the Lower Myria, but derives its present name from the Bulgarians, by whom it was occupied. Its extent is about 280 miles in length and 180 in breadth. The country in general is mountainous, but the plains and valleys, washed by the Danube and rivers that flow into it, are rich and fertile, and produce corn and wine in great abundance. Its ancient capital was Tarnova, but its kings principally resided at Nicopoli; but its present capital is Sophia. It now forms a part of the Ottoman empire. The inhabitants are mostly Christians of the Greek church, ignorant and superstitious, having one patriarch and three archbishops, subject to the authority of the patriarch of Constantinople. They are intermixed, however, with Turkish Mahometans and Jews. Their language is the Slavonic, (which fee,) but in pronunciation differing little from the Servian. The country is divided by the Turks into four Sangiakhkips, viz. those of Vidin or Widin, Sardic comprehending Sophia, Nicopoli, and Shilibla. The present inhabitants, though descended from ancestors who disinguished themselves by their martial achievements, are occupied in grazing, agriculture, and handicrafts. This country is famous for a gate, constructed by the emperor Trajan in the hills south of Sophia, among steep rocks and precipices almost inaccessible, in commemoration of his having marched with his army along a road formed by himself through places that were before impervious. It consists of two stone pillars, with an arch over them, representing a gate; but is now in a mutilated and ruinous condition.

Bulgarians, or Bulgarians, in Ancient History, a tribe of Scythians, who are supposed have inhabited Asiatic Scythia and the countries lying north of the Caspian sea, near the Volga, whence it is said they obtained the name Volari, which was changed into Bulgar; and thence their country was denominated Volgaria and Bulgaria. Others, however, reject this etymology, alleging that the Volga was anciently called Rau, or, in Arabic. Idel, and deduce the appellation of Bulgarians either from their famous and large city Belgar, or from the denomination of Bulgarians which they assumed. The Bulgarians, after having extended their borders along the Don and the Yarik, about the Volga and the Kama, carried on a great trade to Persia, Bucharia, India, Greece, and even to Italy and France, by the Iuicine. They also traded considerably with the Russians, and, by their instrumentality, with the northern nations. Bulgaria was therefore, in former times, the emporium of the European and Asiatic commerce. The Bulgarian empire fell afterwards under the dominion of the Tartars, and when the Russians conquered the
the Tartars, became subject to Russia. Their country was rich and extensive; its borders extended along the Volga, from the mouth of the Oka downwards to the Kholbites, or Nether-Bulgarians, where they had their peculiar sovereignties; and the Azov or Volisaks, along the Kama, were under their supremacy. It is not known how far it reached westward, and on the Don; however, the ‘Tscherniplies and Tschuvashches were subject to them. Their language was the Sarmatic. The ruins of large towns and stone buildings are evidences of their opulence, their civilization, and their industry; and the coins that are dug out of the earth, with Arabic and Indian inscriptions, demonstrate their extensive commerce.

It was not till the reign of Zeno, about the year 485, that they began to be heard of and dreaded by the Romans. Ennodius, the most ancient writer who mentions them, informs us, in the panegyric which he composed on Theodoric, king of the Ostrogoths, that they were a warlike and numerous nation, enured to the toils of war, ever ready to prefer death to slavery, and never known to have been put to flight, till they engaged this hero. From Aisatic Scythia and other countries which they occupied, they advanced, in quest of a more fertile country, to the Tanais, and from thence, in the reign of Zeno, to the banks of the Danube, under the conduct of their king or leader Bladimir. Having passed this river, they made an irruption into Thrace, with a view of settling in that country; but they were opposed by Theodoric, the Ostrogoth, at that time general of the Roman troops in that province, and compelled to repass the Danube. In 489, they made a successful irruption into Thrace and committed dreadful ravages, and defeated the army of the emperor Anastasius, commanded by Arilutus, which was sent to refit them. Three years after this expedition they again invaded Thrace, and carried off an immense booty, of which they plundered the province. In 539, the 13th year of the emperor Justinian, they made an incursion over the Danube into Moesia, defeated the Roman troops, and were retreating with their spoils and captives, after having destroyed by fire and sword what they could not remove, when they were attacked by Justinian’s army under the command of an experienced officer, and obliged to surrender their booty and to save themselves by flight. However, in the following year they again entered Thrace, which they plundered and laid waste; but they were routed with great slaughter, and the loss of many prisoners. For these victories the emperor assumed the appellation of “Bulgarianus,” which appears on his coins. Hillory gives no account of them till the reign of Justinian III. or V. (Blair) furnaced Pogonatus, which commenced in the year 608. In his time they passed the Danube, and entering the Roman territories, committed great devastations in the provinces bordering upon that river. They were fiercely opposed by the powerful army of Justinian, and left at full liberty to ravage the open country at pleasure. At length, in 678, Justinian agreed to pay them an annual pension, on condition of their not infesting the Roman territories, and joining his forces against all other barbarians, wherever he required their assistance. About this time some of them settled in the dukedom of Benevento.

It is said that Justinian allowed them to settle in Lower Moesia, to which they gave the name of Bulgaria, which this province still retains. Other writers, however, suppose that they had settled there several years before the reign of Justinian. In 687 Justinian II., refusing to acquiesce in the treaty stipulated with them by his father, invaded their country, and reduced them to great distress; but the Bulgarians, animated by despair, determined to make a last effort in defence of their liberties; and falling unexpectedly upon the emperor’s army, put it to flight, and obliged him to confirm his father’s treaty. In 713 they made an irruption into Thrace and advanced to the gates of Constantinople, and after having ravaged the country, returned home, with an immense booty, unmolested. When Constance Copronymus, in the 9th year of his reign, A.D. 749, ordered forts to be built on the borders of the provinces, adjoining the country of the Bulgarians, they renounced; but their ambassadors were dismissed with a disdaining answer. Upon this the incensed Bulgarians made a sudden irruption into the Roman territories, and having laid waste the country, returned home loaded with booty. The emperor collecting his forces marched against them in person; but whill he was laying waste their country, they took advantage of attacking him in a narrow path, obliged him to fly, and pursued him with great slaughter to the gates of Constantinople. In the years 763 and 775 the Bulgarians suffered great injury in their contests with the Romans; but upon the accession of Leo IV. A.D. 775, he concluded a peace with their king, whose daughter Irene he had married; but his son and successor Constanzt Porphyrogenitus, in the 12th year of his reign, A.D. 791, deluded by some ambassadors, attacked the Bulgarians, and was totally defeated. The Bulgarians renewed their irruption into the Roman provinces in the reign of Nicephorus; and the emperor retaliated by marching with a large army into their country and ravaging it with fire and sword. The ambassadors of the Bulgarians, who were sent to him to sue for peace and to request his leaving their country, were treated with scorn; upon which their king Crumus, actuated by despair and the thirst of revenge, began to fortify all the passes through which the emperor was to retire, and then proceeded to attack the Roman camp. This he forced, flew the emperor, and cut off almost his whole army. The savage conqueror ordered the head of Nicephorus to be strung off, and after having exposed it to public view, he inclosed the skull in silver, and used it in all grand entertainments instead of a cup. In 811 Michael I. ascended the throne, and a peace was concluded between the Romans and Bulgarians; but it was of very short duration. Crumus, offended by the treacherous escape of some Roman prisoners, levied a considerable army, entered the Roman territories, and assisted by an Arabian in the use of military engines, reduced several fortified places, and ravaged the whole country. Among other cities which he reduced, he made himself master of Mesembria, in the vicinity of Mount Hsemus, and put the garrison to the sword. The emperor prepared for an engagement, and the two armies met in the neighbourhood of Constantinople. After a furious conflict of doubtful issue, the Romans were utterly defeated; and Michael retired to a monastery, and resigned the purple to Leo V. A. D. 813. The Bulgarians, wanting triumphing in their success, refused to listen to any pacific overtures; and a second engagement took place, in which the Romans, after an obstinate resistance, were routed. But whilst the Bulgarians were busily engaged in plundering the Roman camp, Leo renewed the fight and obtained a complete victory. The Bulgarians remained for five years in a state of tranquillity; but at length, in the year 877, they took occasion to re-enter the Roman territories, and in their usual manner to ravage them with fire and sword. A battle ensued, and the Roman army was routed. The prisoners were led by the victor in triumph round his camp, and having caufed their noses to be cut off, he sent them, thus defaced, to Constantinople. After subsequent advantages gained on
the part of the Bulgarians, and repeated defeats and severe losses sustained by the Romans, Adrianople was besieged and taken, A.D. 972; and preparations were made for besieging Constantinople. But, before the close of the following year, an interview took place between Theodosius, the king of the Bulgarians, and Romanus the eastern emperor, and a peace was concluded between them. In the year 972 the Ruffi or Rossii, who inhabited the present Podolia, invaded Bulgaria and ravaged the country; but having invaded Adrianople with a powerful army of more than 300,000 men, they were defeated and cut to pieces by a body of 12,000 Romans. The Bulgarians submitted to Zamfes, their deliverer; but upon his death, A.D. 975, they revolted from the Romans and renewed their usual ravages of their provinces. After a long and difficult struggle between the Bulgarians and the emperor Basil, he at last prevailed, and, in the 44th year of his reign, A.D. 1018, reduced Bulgaria into the form of a Roman province. From this time the Bulgarians remained in subjection to the emperors of Constantinople, whom they profited in both against the Turks and the Turks, and were, on that account, allowed to choose a king of their own nation, who nevertheless owned himself a vassal of the empire. The Bulgarians, however, revolted again in the reign of Isaac Angelus, A.D. 1185. In 1275, Stephen, the fourth king of Hungary, having vanquished the prince of Bulgaria and cut his whole army in pieces, obliged the Bulgarians to acknowledge him as their sovereign. With the assistance of the Greek emperors they shook off the Hungarian yoke; but attempting, in 1396, to recover Adrianople, which had been taken by the Turks, they were totally defeated by Amurath I.; and Bajazet, who succeeded Amurath, made an absolute conquest of the whole country in 1396, and reduced it to a province of the Turkish empire, in which it has continued ever since. BULGARIAN Language, the same with the SCALONTO, which &c.

BULGNEVILLE, in Geography, a town of France, in the department of the Vosges, and chief place of a canton in the district of Neufchateau, 31 leagues south of it. The town contains 9,555, and the canton 19,883 inhabitants. The territory comprehends 262½ square miles and 27 communes.

BULIA, or BULIS, in Ancient Geography, a maritime town of Greece, in the Pheacie, situate towards the gulf of Corinth, near the frontiers of Aetolia. It had two temples, one of Bacchus and another of Diana; the statues of which were formed of wood.

BULIMIA, in Medicine, a term signifying excessive hunger, from bulus, a particle denoting excess, and λυσις, hunger. It is also called fames cunic, fames lupina, dog's appetite, wolf's appetite, &c. This symptom occurs in cafes where the food is not retained long enough in the stomach to be digested, as in cafes of habitual vomiting, and in insomnity; also where the aliment, duly prepared or concocted in the stomach, is nevertheless but scantily conveyed into the circulation, as in the case of worms, and obstruction of the mesenteric glands; and it is said that this symptom occurs where much acidity is present in the alimentary canal. Savages, with his usual superstition, has enumerated seven different species of bulimy; but in most of the instances which he has mentioned, it is rather to be regarded as a concomitant of other disorders, than as a distinct and specific affection. Ruyseh gives an instance of this complaint, which was connected with a dilatation of the pylorus, in consequence of which the food slipped through the stomach into the intestines, before there was time for digestion to take place; and it is recorded by Lienhart, that upon opening the body of a patient who had died of a disorder, in which a voracious appetite was a leading symptom, he discovered a preternatural termination of theculus cholechochus in the stomach. In this case the bile effused into the stomach seems to have kept up a confluent irritation in that organ, and to have stimulated the stomach to expel the ingesta before they could be duly acted upon by the principal agent in the work of digestion, the gastic fluid.

From these observations it is evident: that the plan of treatment must be varied, according to the diversity of the morbid conditions with which it is connected. Thus, when it is the consequence of an immediate rejection of the food by vomiting, the irritability of the stomach should be counteracted by mild glutinous food, by opiates, tonics, &c., aided by stimulant epitetms, and other topical applications. At the same time nutritive enemata should be injected into the intestines. In like manner, when it is the consequence of the food passing off too rapidly by stool (as in lentency), the remedies adapted to that condition of the body should be referred to. (See LENTENCY.) If it proceed from worms, calomel, jalop, cowitch, and other anthelmintics, should be preferred; if from melenicteric obfuration, rhubarb, neutral febiles, and afterwards chalybeates; and, lastly, when it arises from acidity in the stomach and intestines, biters and abominales should be given.

After this view of the various causes of bulimy, and of the treatment as adapted to each of those causes, we shall proceed to notice some remarkable and well-authenticated instances of this affectation. In 1700 there lived at Stanton, seven miles from Bury, a labouring man of middle age, who for many days together had such an inordinate appetite that he would eat up an ordinarq leg of veal, roasted, at a meal. He would eat raw-thistles, and various other herbs, as greedily as cattle are wont to do; and all he could get was little enough to satisfy his hunger. He voided several long worms. This case is related by Dr. Burroughs, in the 22d vol. of the Phil. Trans. Two other cases are recorded in the 43d vol. of the fams Transactions, one by Dr. Mortimer, the other by Dr. Cookson. The subjects of this affectation were in both instances boys. The first of them was 12 years old, and lived at D idle Barnsley, in Yorkshire. His appetite was so ravenous, that if he was not supplied with food when he craved it, he would gnaw the very flesh off his own bones. When awake he was constantly devouring. Nothing pafled his roach; it was always thrown up again. In the space of six days he devoured 354 lbs. of liquid and solid food. The other boy was 10 years old, and had been feized with a fever about 15 months before, which continued for a fortnight, and was followed by constant vomitings. As in the former case, so in this, the food was no sooner swallowed than thrown up again. In the space of six days this boy devoured 371 lbs. of meat and drink, besides 1 lb. 10 oz. of salt. After more than a twelvemonth from the first attack, he died greatly emaciated.

In the third vol. of the Memoirs of the Medical Society of London, is inserted the history of a case of bulimy, accompanied with vomiting, wherein 379 lbs. of meat and drink were swallowed in the space of six days, yet the patient lost flesh rapidly. A cure was effected by giving food boiled down to a jelly, frequently, and in small quantities. In this form the food was retained, and the body being duly supplied with nourishment, the stomach and intestines recovered their proper tone and energy. But the most extraordinary instance of bulimy which perhaps ever occurred, is that
that recorded in the third vol. of the Medical and Physical Journal, communicated by Dr. Johnfon, commissioneer of sick and wounded men, to Dr. Blane, formerly physician to the navy. The subject was a Polish folder, named Charles Domery, in the service of the French, on board of the Hoche frigate, which was captured by the squadron under the command of Sir J. Borlase Warren, off Ireland, in 1710. He was 21 years of age, and stated that his father and brothers had been remarkable for their voracious appetites. His began when he was 13 years of age. He would devour raw and even live cats, rats, and dogs, besides bullock's liver, tallow-candles, and the entrails of animals. One day (viz. September 7th, 1759) an experiment was made of how much this man could eat in one day. This experiment was made in the presence of the before-mentioned Dr. Johnfon, admiral Child, and Mr. Porter, agent for prisoners at Liverpool, and several other gentlemen. He had breakfasted at four o'clock in the morning on 4 lbs. of raw cow's udder; at half past nine o'clock there were put before him 5 lbs. of raw beef and 12 tallow candles of 1 lb. weight, together with 1 bottle of porter; these he finished by half past ten o'clock. At one o'clock there were put before him 5 lbs. more of beef, 1 lb. of candles, and 3 bottles of porter. He was then locked up in the room, and fenciers were placed at the windows to prevent him from throwing away any of his provisions. At two o'clock he had nearly finished the whole of the candles, and great part of the beef; but without having had any evacuations by vomiting, stool, or urine; his skin was cool, pulse regular, and spirits good. At a quarter past six he had devoured the whole, and declared he could have eat more; but the prisoners on the outside having told him that experiments were making upon him, he began to be alarmed. Moreover, the day was hot, and he had not had his usual exercise in the yard. The whole of what he consumed in the course of one day amounted to:

<table>

<tr>
<td>Candles</td>
<td>10 lbs.</td>
</tr>
</tbody>
</table>

Besides 5 bottles of porter.

The eagerness with which this man attacked his beef when his stomack was not gorged, resembled the voracity of a hungry wolf; he would tear off large pieces with his teeth, roll them about his mouth, and then gulp them down. When his throat became dry from continued exercise, he would lubricate it by slipping the grace out of a candle between his teeth; and then, wrapping up the wick like a ball, would send it after the other part at a swallow. He could make shift to dine on immense quantities of raw potatoes or turnips, but his choice would rather taste bread or vegetables. He was in every respect healthy, 6 feet 3 inches high, of a pale complexion, grey eyes, long brown hair, well made but thin, his countenance rather pleasant, and he was good tempered. His evacuation by the bowels was by no means proportioned to the quantity of food he devoured, and even did not exceed that of other men; but his periphrases were profuse, not only when in bed, but also when up and eating. To the profusion of this evacuation, Dr. Johnfon, and the other medical gentlemen, have ascribed the rapid diffusion of the ingesta, and his incessant craving for fresh supplies of food. It does not appear that he had wounds.

BULINUS HEMASTOMUS, in Catechology. See Turbo Hemastomus.

BULITAGA, in Geography, a range of mountains which separates the empire of Ruflia from Perhia. N. lat. 43° 30' to 51° 15' E. long. 72° 14' to 73° 14'.

BULITHOS, lapis bexinctus, a calculus or stone found in the gall-bladder, kidneys, or urinary bladder of oxen. Influences hereof are given by Brunelli, the Academy Nature Curiatorium, and other naturalists, by which it appears that Aristotol was mistaken in alleging, that man alone is subject to the stone, and inquiring solicitously into the reason hereof. Arith. Probl. x. n. 42.

BULK of a ship, denotes her whole content in the hold for cargo or goods.

BULK, to break. See Breaking.

BULK-heads, are partitions made across a ship, or lengthways, with boards of timber, whereby one part is divided from another. The bulk-head afore is the partition between the fore-castle and gratings in the head, and in which are the chaise-ports.

BULKA, in Geography. See Bulcau.

BULKLEY, Charles, in Biography, a Protestant dissenting miller, was born in London in 1710, educated in Dr. Doddridge's academy at Northampton, whither he removed from Cheffer in 1739, and commenced preacher in 1742. After some time he settled in London, where he was baptized by immersion, and joined the general Baptists. After having conducted his labours with ability and reputation, in connection with a congregation of this description, for a long series of years, during which he succeeded the eloquent Dr. Fother in his lectures at the Old Jewry, he died in 1797, in the 75th year of his age. Besides several single sermons, preached on particular occasions, he published "Discourses on several Subjects," 1752; "A Vindication of Lord Shaftesbury's Writings," 1753; "Notes on Lord Bolingbroke's Philosophical Writings," "Observations on Natural Religion and Christianity," candidacy proposed in a Review of the Discourses lately published by the Lord Bishop of London, in 5 volumes; "Economy of the Gospel," 4 vols. 1764; "Discourses on the Parables and Miracles of Christ," 4 vols. 1770; "Catechetical Exercises," 1774; "Preface to Notes on the Bible," 1791; &c. Evans's Funeral Sermon, 1797.

BULL, in Astronomy, the constellation Taurus, which for

BULL, Dr. John, in Biography, was born about 1560, in Somersetshire, and became, by his great abilities on the organ and virginal, the wonder of his time. Indeed, the prosperous reign of queen Elizabeth was, perhaps, not rendered more illustrious by the musical productions of Tallis, Bird, and Morley, than the performance of Dr. Bull. His music-master was William Mithman, organist of the chapel royal to queen Elizabeth, in which capacity he held a very high rank. Bull, on the death of his master, in 1591, was appointed successor to the queen's chapel; and in 1592, at the recommendation of his majesty, he had the honour of being the first that was appointed a music-professor to Gresham college. And though unable to compose and read his lectures in Latin, according to the founder's original intention, such was his favour with the queen and the public, that the executors of Sir Thomas Gresham, by the ordinances, bearing date 1597, dispensed with his knowledge of the Latin language, and ordered, "The solemn music lecture to be read twice a week in manner following, viz. the theoretical part for one half hour, or thereabouts, and the practice by concert of voice or instruments, for the rest of the hour: whereas the first lecture should be in the Latin tongue, and the second in English." But because at this time Mr. Doctor Bull, who is recommended to the place by the queen's most excellent majesty, being not able to speak Latin, his lectures are
BULL.

people to be altogether in English so long as he shall continue in the place of music lecturer there." Ward’s Lives of the Professors of Gresham College, Pref. p. viii. The first lecture read by Bull, at Gresham college, was printed the same year that it was pronounced, under this title: "The Oration of Master John Bull, Doctor of Musick, and one of the Gentlemen of his Majestie Royall-Chappell, as he pronounced the same, before divers worshipful persons, the Aldermen and Commoners of the citie of London, with a great multitude of other people, the 6th day of October, 1597, in the new erected Collidge of Sir Thomas Gresham, Knt. deceased: made in the commendation of the founder, and the excellent science of Musick." Imprinted at London by Thomas Ege.

At first, application was made to the two universities, by the lord mayor and corporation of London, jointly with the mercers’ company, left trustees of this institution, to nominate two persons in all the liberal arts fitly qualified to read lectures in their several faculties; but this application was not continued, as some jealously seems to have been awakened at Oxford and Cambridge, left this new college should be prejudicial to those ancient seats of learning.

What effect this liberal foundation had on other faculties let the friends and patrons of each particular science say; but as to music, it is hardly possible to read the lives of the professors without lamenting that the design of so noble an institution, established on such an extensive plan, should be so entirely frustrated as to become wholly useless to that city and nation for whose instruction it was benevolently intended. Dr. Bull, the only person on the list of music professors, who seems to have been able to inform by theory, or amuse by practice, those who attended the musical lectures, resigned his professorship in 1607. Indeed, during more than a year of his professorship, Mr. Thomas Bird, son of the venerable William Bird, exercised the office of a substitute to Dr. Bull, while he travelled on the continent for the recovery of his health. So that except about nine years from the date of the establishment, to the present times, it does not appear that the science of sound, or practice of the musical art, has been advanced by subsequent professors. For in the following list, given by Dr. Ward, up to the year 1240, including Dr. Clayton, elected 1607; John Taverner, 1610, who was no relation of the musician of that name; Richard Knight, 1638; William Petty, 1650, afterwards the famous Sir William Petty; Dr. Thomas Baynes, 1660; William Perry, 1681; John Newy, 1666; Dr. Robert Shippen, 1703; Dr. Edward Shippen, his brother, 1712; John Gordon, 1723; and Thomas Brown, 1739; though all men of learning and abilities in other faculties, yet no one of them had ever distinguished himself, either in the theory or practice of music; nor are any proofs remaining that they had ever studied that art, the arca of which they were appointed to unfold! What an abuse of reason and munificence does it feem, that those who had never meditated on the art, or been taught, themselves, should be fixed upon to teach, and direct the studies of others!

A silly story has been told by Anthony Wood (Falli Oxon. vol. i. c. 131) concerning a feat performed by Dr. Bull, who, at St. Omer’s, when he first visited the continent, to a composition originally written in forty parts, added forty more in a few hours; which is so improbable, as not to be worth relating.

After the decease of queen Elizabeth, he was appointed organist to king James. And July the 16th, 1607, when his majesty and prince Henry dined at Merchant-Taylors’ hall, the royal guests were entertained with music, both vocal and instrumental, as well as with several orations. And while his majesty was at table, according to Stow, "Mr. Doctor Bull, who was free of that company, being in a citizens gowne, cappe, and hood, played most excellent melody upon a small p阃e of organs placed there for that purpose only." (Chron. p. 891. ed. 1615.) In December, of the same year, he resigned his professorship of Gresham college, but for what reason does not appear, as he continued in England several years afterwards.

In 1613 he quitted England, and entered into the service of the archduke, in the Netherlands. He afterwards seems to have been settled at Lubeck, at which place many of his compositions in the lit published by Dr. Ward, are dated; one of them as late as 1622, the supposed year of his decease.

Dr. Bull has been censured for quitting his establishment in England; but it is probable that the increase of health and wealth was the caufe and consequence. Indeed he seems to have been prais’d at home, more than rewarded; and it is no uncommon thing for one age to let an artifl flave, to whom the next would willingly erect statues. The professorship of Gresham college was not then a finecure. His attendance on the chapel royal, for which he had forty pounds per annum, and on the prince of Wales, at a similar salary, though honourable, were not very lucrative appointments for the first performer in the world, at a time when scholars were not so profitable as at present; and there was no public playing, where this most wonderful musician could display his abilities, and receive their due applause and reward.

A lit of more than two hundred of Dr. Bull’s compositions, vocal and instrumental, is inserted in his life, which, when it was written in 1740, were prefixed in the collection of Dr. Pepusch. The chief part of these were pieces for the organ or virginal, which we have seen and examined, having been transcribed into queen Elizabeth’s virginal book, and printed in a collection called Parthenia. An In nomine, of five parts, we have scored from the Church Church set of manuscript books, in Dr. Aldrich’s collection, and have attentively perused his choral composition in the collections of Dr. Treway and Dr. Boyle, which is the same verfe anthem, with different words, for two voices, with a chorus. In all this vocal music that we have seen, there seems to be much more labour and study than genius. Tallis and Bird had so long accustomed themselves to write for voices, that the parts in their compositions are much more natural and flowing than those of Bull. In looking at the single parts of Tallis and Bird, there are notes and passages which appear wholly insipid and unmeaning, as melody; but which, when heard in harmony with any other part, produce admirable effects.

Indeed, possessed as he was of such extraordinary powers of execution on keyed instruments, we have been frequently astonished, in perusing Dr. Bull’s lefions, at the few new and pleasing passages which his hand suggested to his pen. It has been said, that Dr. Pepusch preferred Bull’s compositions to those of Couperin and Scarlatti, not only for harmony and contrivance, but air and modulation: an assertion which rather proves that the doctor’s taste was bad, than Bull’s music good. Though we should greatly admire the hand, as well as the patience, of any one capable of playing his compositions; yet, as music, they would afford us no kind of pleasure: ce font des notes, et rien que des notes; there is nothing in them which excites rapture. They may be heard by a lover of music with as little emotion as the clapper of a mill, or the rumbling of a post-chaise.

After such frequent mention of the extreme difficulty of these old pieces, in mercy to modern performers, it may with truth
truth be said, that the loose, to refined ears, would not be very
great, if they should for ever remain unplayed and unde-
ciphered. For being generally built on some old and vulgar
psalmody tunes, unmeaning in themselves, the crowded har-
mony and multiplied notes with which they are loaded, have
not rendered them more pleasing. Indeed the infallible
consequences of a young practitioner flowing such tune
and labour on them as may be necessary to subdue the diffi-
culties of execution they contain, would be corruption of
taste, and neglect of more useful studies.

The instrumental music of queen Elizabeth's reign seems
to partake of the pedantry and foppishy of the times:
eterial fugues upon dry and unmeaning subjects were the
means of establishing reputation for learning and contribute;
as dull divisions and variations, in which the change was
generally from bad to worse, seem to have been the only
qualifications which entitled a professor to eminence for style
and invention.

The very terms of canon and fugue imply restraint and
labour. Handel was perhaps the only great fuguiler, except
from pedantry. He seldom treated barren or crude subjects;
his themes being almost always natural and pleasing. Se-
bastian Bach, on the contrary, like Michael Angelo in
painting, disdained facility so much, that his genius never
flopped to the easy and graceful. We never have seen
a fugue by this learned and powerful author upon a motive,
that is natural and abounding; or even an easy and obvious
passage, that is not loaded with crude and difficult accompa-
niments.

As the youth of Bull must necessarily have been spent in
subduing the difficulties of other composers, he seems, in his
riper years, to have made the invention of new difficulties of
every kind, which could impede or confound a performer, his
fugue study. It seldom happens that those perfected of great
natural force of hand, on any instrument, submit to the
drudgery of much dry study; but this gift was so far from
relaxing the labour and diligence of Dr. Bull, that he entered
deeply into all the arcana of the art, and pedantry of the
times, than most of his contemporaries. That he was "ex-
quisitely skilled in canon," has been given as one of the most
irrefragable proofs of his being a great musician; and canons,
residet rotur, and per asini et beotum, in triangular, and other
fantastical forms, are carefully preserved, as stupendous spe-
cimens of his abilities.

Walsingham has been a subject upon which Dr. Bull and
Bird have exercised their abilities in the most elaborate man-
ner. In the fifteenth century, popular tunes were the
foundations upon which the greatest contrapuntists constructed
even the masses which they set to music; and in the next, the
English, no longer in want of these tunes in the church,
polished and tricked them up for the chamber, with every art
and embellishment they could devise.

Both Bird and Bull have likewise worked on the hexa-
chord, ut re mi fa sol la, ascending and descending; upon
which theme they have constructed elaborate and ingenious
lessons, of the most difficult execution. That of Bull has
passages for the left hand, which perhaps none but himself
could play during his own time, and which we have never
seen introduced in any compositions of the present century,
except those of Sebastian Bach; or heard executed, but by
Pallaga, near forty years ago; who must have vanquished them
by the incessant labour of several years, out of his short
life; for he was then but eight years old. A new, but
similar difficulty, has lately been devised for keyed-instru-
ments, in the rapid divisions for one hand, in dittones, which
great application only can vanquish. The execution of long
and rapid divisions of thirds and sixths; and even of common
chords, is not frequently wanted in modern music, and there-
Bull.

However, escape the mimadversions and cenures of several Pluriform writers. Five years after the completion of this book, the author was preferred to the valuable rectory of Avebury, in Gloucestershire. Soon after, in 1688, he was prorogued by archbishop Sancroft, to the archdeaconry of London, and in consideration of his eminent services to the university of Oxford, conferred upon him the degree of doctor in divinity. During the reign of James II. he preached with great ardour against the errors of popery. In 1663, he published his “Judicium Ecclesie Catholicæ, &c.” in defence of the anathema, decreed by the first council of Nice. For this work the author received the thanks of the whole body of the clergy of France; though, considered as the vindication of an anathema, which condemns some of the highest ornaments of literature and Christian truth both in and out of the church, it will not now be regarded as entitling Dr. Bull to any very distinguishing commendation. The last treatise written by this learned author, was his “Primitive Apologetic Tradition of the Doctrine received in the Catholic Church, concerning the Divinity of our Saviour Jesus Christ, asserted, and evidently demonstrated, against Daniel Zurchick the Priftinum, and his late Followers in England.” All his Latin works, published by himself at different times, were collected and printed in 1753, in one volume, folio, by Dr. J. E. Grabe, with a preface and annotations. In 1765, Dr. Bull was promoted to the bishopric of St. David’s, and taking his seat in the house of peers, in the session, when the bill passed for the union of both kingdoms, he bore testimony in favour of the church of England, as being “in her doctrine, discipline, and worship, most agreeable to primitive and apologetic institution.” He resided constantly in his diocese, and carefully discharged all the episcopal functions; but in 1770, he closed his laborious and useful life at Brecknock, the customary place of his residence, where he was interred, leaving behind him a widow and two children, the survivors of eleven. His constitution was naturally firm and vigorous; but his most unusual application had to a considerable degree impaired it before the close of his life. His temper was lively, irritable, and inclined to melancholy; nor does he seem to have been entirely free from a tincture of superstition. He was remarkable for the firmness of his mind, and for an habitual sense of religion, which influenced his conduct after the first devotions of his youth. His learning was recommended by the modesty that accompanied and adorned it; and his patience, piety, and Christian hope were signally exemplified during the painful paroxysms of the disease that terminated his life. Bishop Bull’s sermons and larger discourses were published in 1713; by Mr. Neilton in three volumes, 8vo. The first of these volumes contains two sermons on the intermediate state, which were re-published in 1765 by the late professor Chappelow, and which have been animadverted upon by the author of the “Historical View of the Controversy concerning the intermediate State, &c.” All the bishop’s works have been published together, in folio, by Mr. Neilton, who also published his “Life” in 1717, 8vo. Biog. Brit.

Bull, in Ecclesiastical Writers, denotes an instrument dispatched out of the Roman chancery, sealed with lead; answering to the edicts, letters patent, and provisions, of secular princes.

The bull is thus described by Matthew Paris, anno 1257: “In bulla domini pape flat image Paulo a destinis crucis in medio Bulla figurae, et Petri in fingura.”

The word bull is derived from bulla, a seal; and that from bulla, a drop, or bubble: or, according to others, from the Greek, βοῦς, κονίλ: according to Pezron, from the Celtic bull, or bull, a bubble.

We meet with four kinds of these bulla or bullæ; golden, silver, waxen, and leaden; all in use among the emperors and kings of the middle and barbarous ages. In form, the impression is made on the solid metal itself; in others on wax; and only enclosed in a metalleous box, or case.

Sealing with metals is an illustrious privilege, belonging only to princes, though assumed also by prelates, as princes of the church. The doges of Venice durst not arrogate this honour, till leave was given them by pope Alexander III. about the year 1170, to seal their diplomas with lead.

The bull is the third kind of apostolical rescript, and the molt in use, both in affairs of justice and of grace. It is written on parchment; by which it is distinguished from a brief, or simple signature, which is on paper. A bull is properly a signature enlarged: what the latter comprehends in a few words, the former dilates and amplifies.

If the bulls be letters of grace, the lead is hung on filken threads; if they be letters of justice, and executory, the lead is hung by a hempen cord. They are all written in an old roman or Gothic letter.

The bull, in the form wherein it is to be dispatched, is divided into five parts; viz. the narrative of the fact; the conception, that clause; the date; and the fiatulation, in which the pope takes on himself the quality of “servant of the servants of God,” that is, a servant of God.

Properly speaking, it is the seal or pendant lead alone that is the bull: it being that which gives it both the title and authority. The seal presents, on one side, the heads of St. Peter and St. Paul; on the other, the name of the pope, and the year of his pontificate.

By bulls, jubilees are granted: without them no bishops in the Roman church are allowed to be consecrated. In Spain, bulls are required for all kinds of benefices; but in France, &c. simple signatures are sufficient; excepting for bishoprics, abbeys, dignitaries, and priories conventual. According to the laws of the Roman chancery, no benefices, exceeding twenty-four decans per annum, should be conferred without bulls; but the French would never submit to this rule, except for such benefices as are taxed in the apostolical chamber: for the rest, they reserve the right of disvaluing the benefit, expressing it in general terms: Conus & illi foro annorum fravius 24 decanorum auri de cantari, frommund cummum aminationem, velibem annum non exsect.

The bulls brought into France were limited and moderated by the laws and customs of the land, before they were registered; nor was any thing admitted till it had been well examined, and found to contain nothing contrary to the liberties of the Gallican church: those words, proprio motu, in a bull, were sufficient to make the whole be rejected in France. Nor do the Spaniards admit the papal bulls implicitly; but, having been examined by the king’s council, if there appear any reason for not executing them, notice thereof is given to the pope by a supplication; and the bull, by this means, remains without effect: and the like method of proceeding with the court of Rome is observed by most of the other courts of Europe, in the papal comission.

To culminate bulls, is to make publication thereof, by one of the three commissioners to whom they are directed; whether he be the bishop or official. This publication is sometimes opposed; but when it is, the fault is not charged on the pope who issued the bull; but an appeal is brought
BULL.

to him against the person who is supposed to make it; thus the fault is laid, where it is known not to be just, to evade affronting the pontiff. See Fulmination.

The bull in cena Domini, is a bull read every year on Maundy-Thursday, in the pope's presence; containing various excommunications and excretations against heretics, those who disfigure the see, who disurb or oppose the exercise of ecclesiastical jurisdiction, &c.

After the death of the pope, no bulls are dispatched during the vacancy of the see, to prevent any abuses; therefore, as soon as the pope is dead, the vice-chancellor of the Roman church takes the seal of the bull; and in the presence of several prelates, orders the name of the deceased pope to be erased; and covers the other side on which are the heads of St. Peter and St. Paul, with a linen cloth, sealing it up with his own seal, and giving it, thus covered, to the chamberlain, to be preferred, that no bulls may be sealed with in the mean time.

These decrees of the pope are often mentioned in our statutes, as 25 Edw. III. 28 Hen. VIII. c. 15; and 2 Ph. and M. c. 8; and 13 Eliz. c. 2. They were formerly used, and of force in this country; but by Stat. 28 Hen. VIII. c. 16, all bulls, &c. obtained from the bishop of Rome are void; and by 13 Eliz. c. 2. (see also 23 Eliz. c. 1.) the precuring, publishing, or using of any of them is high treason.

Bull, golden, is a denomination peculiarly given to an ordinance, or statute, made by the emperor Charles IV. in 1356, laid to have been drawn up by that celebrated lawyer, Bartoli, and still reputed the magna charta, or fundamental law of the empire. It was composed and published at a diet convoked by the emperor at Nuremberg; and is thus called from a golden seal fixed to it, such as were used by the emperors of Constantinople, annexed to their edicts.

Till the publication of the golden bull, the form and ceremony of the election of an emperor were dubious, and undetered; and the number of electors was not fixed: this solemn edict regulating the functions, rights, privileges, and pre-eminences of the electors. The original, which is in Latin, on vellum, is kept at Frankfort. On the back side of it there are several knots of black and yellow flax, to which hangs a bull, or seal of gold. It is pierced through the middle with a golden wire, the ends of which are fastened by a seal of gold, about the size of a half crown, one side exhibiting the figure of Charles IV. upon a throne, and the reverse, a kind of gate, inscribed "Aurea Roman." On the exergue are these words: "Caroli IV. Rom. Iap. dim. Augustus, rex Bohemiae." This is prefixed in a square wooden box. This ordinance, containing thirty articles, was approved of by all the princes of the empire, and remains still in force. The election of the empire is by it declared to belong to seven electors; three of them ecclesiastics, viz. the archbishops of Mentz, Treves, and Cologne; and four seculars, viz. the king of Bohemia, prince Palatine, duke of Saxony, and marquis of Brandenburg.

Bull, Caroline, a famous constitution published by Charles IV. A.D. 1359, which cancelled all the statutes or regulations that had been made to prejudice of ecclesiastical liberty, and denounced the severest penalties against those who should aggrieve the persons of the clergy. It was issued in order to pacify pope Innocent VI., who had been alarmed and offended by some plans of reformation which the emperor had adopted. With a view of reforming the German clergy, he communicated to the bishops the measures he had taken for this purpose, and threatened to debar the revenues of those who should refuse to obey his orders. The pope, believing the honour and liberty of ecclesiastics at stake, desired the emperor to forbear meddling with the reformation of the clergy, which was his province, and inflicted upon his refractors what the secular noblemen had at different times suffered from ecclesiastics. This circumstance occasioned the publication of the Caroline bull.

Bulls, golden, were set in use among the eastern emperors for a considerable time, leading being confined to matters of a smaller moment. Spelman mentions a golden bull, in a treaty of alliance with our Henry VIII. and Francis I. of France; the same author relates, that the instrument, whereby Clement VII. gave king Henry VIII. the title of Defender of the Faith, had golden bulls affixed to it; and there are other influences in Du Cange and Alphenna.

Bulls, silver, were not in so frequent use, though influences of them are not wanting.

Bulls, leaden, were sent by the emperors of Constantinople, to despots, patriarchs, and princes; and the like were also used by the grandees of the imperial court, as well as by the kings of France, Sicily, &c. and by bishops, patriarchs, and popes. Polydore Virgil makes pope Stephen III. the first who used leaden bulls, about the year 772. But others find influences of them as early as Sylvestre, Leo I. and Gregory the Great. The later popes, besides their own names, strike the figures of St. Peter and St. Paul on their bulls; a practice first introduced by pope Pachial II.

Bulls, waxen, are said to have been first brought into England by the Normans. They were in frequent use among the Greek emperors, who thus sealed letters to their wives, mothers, and sons. Of these there were two sorts, one red, the other green. Du Cange, Gloss. Lat. tom. i. § Gloss. Græce. Montfacon, Palæolog. lib. vi.

Bull of Phalaris, or Perillus, a brazen bull made by Perillus the Athenian, to flatter the cruelty of Phalaris, tyrant of Agrigentum, for the purpose of tormenting criminals. It was formed in the shape of that quadruped, and when perfumes were inhaled in it, fire was applied, and their cries are said to have resembled the roaring of a bull. Perillus is said to have been the first who suffered in it, for having extorted too great a recom pense for the construction of it. Phalaris himself was punished by the people of Agrigentum for his cruelty, by being put to death, as some say, in his own bull. When Hannibal took the city, this bull, among other treasures and valuable curiosities, was sent to Carthage; and it was afterwards referred to the Agrigentines by Scipio, when he took Carthage, in the third Punic war. Cic. l. iv. in Verrem. c. 33.

Bull, in Geography, a large rock in the Atlantic ocean, about three miles W. of Durley island, on the coast of the county of Kerry, Ireland. N. lat. 51° 33'. W. long. 10° 59'.

Bull, a rock near the west point of the island of Rag- liu, in the North channel, about seven miles N.W. of Fairhead, in the county of Antrim, Ireland. N. lat. 53° 19'. W. long. 6° 10'.

Bull, North and South, two banks of sand in the bay of Dublin, Ireland, between which lies the small sand banks, called the bar. There are buoys to mark these banks, but notwithstanding every improvement of the harbour, and every precaution, they sometimes occasion shipwrecks.

Bull, in Rural Economy, an animal of much importance to the flock farmer. For the purposes of the breeder the head of the bull should, according to Mr. Culley, "be rather long, and the muzzle fine; his eyes lively and prominent, his ears long and thin, his horns white; his neck, riding:
BULL

rising with a gentle curve from the shoulders, and small and fine where it joins the head; his shoulders moderately broad at the top, joining full to his chine, or crops and chelt backwards, and to the neck vein forwards; his bosom open, breast broad, and projecting well before his legs, his arms or fore thighs muscular, and tapering to his knee; his legs straight, clean, and very fine-boned; his chine and chelt to fail as to leave no hollows behind the shoulders, the plates strong, to keep his belly from sinking below the level of his breast; his back or loin broad, straight, and fat, his ribs rising one above another in such a manner, that the last rib may be rather the highest, leaving only a small space to the hips or hooks, the whole forming a round or barrel-like carcase; his hips should be wide placed, round or globular, and a little higher than the back, the quarters from the hip to the rump long; and instead of being square, as recommended by some, they should taper gradually from the hips backwards, and the turf or pott-bones not in the least protuberant; rumps slope to the tail, the tail broad, well haired, and set on so high as to be in the same horizontal line with his back.

This is an animal chiefly kept for the purpose of propagation, though he is capable of being subjected to the yoke; but there is no certainty of his working quietly; and the use he may make of his prodigious strength should constantly be guarded against. Bulls are for the most part naturally unrulable, stubborn, and fierce; and frequently in the bulling season absolutely furious and uncontrollable; however, by education, they may be rendered perfectly tame and quiet, without the least diminution of their strength. They also often grow larger, more heavy and unwieldy, and become more adapted to labour, as well as more tractable, by this operation. See Ox and CATTLE.

The disposition of these animals is, however, shown to depend greatly upon the manner in which they are reared by the practice of Mr. Bakewell, who had all his bulls fo tame and gentle, that they could be managed with the greatest facility.

Among the Ancients, those who triumphed, sacrificed a bull, when they arrived at the capitol. Bulls were offered to Apollo and Neptune. It was held a crime to sacrifice them to Jupiter, though we do not want instances of that practice.

Bulls were ranked by the Romans in the number of military rewards.

Bull, African, in Natural History, a small wild bull, common in that part of the world, and supposed to be the true bubalus of the ancients. See Bubalus.

Bull's blood, fresh drawn, is said to be a powerful poison, as coagulating in the stomach. This is related on the authority of Pliny, xxviii. 9. and xi. 38. and many persons among the ancients, such as Aslon, Mida, Hannibal, and Tullus the Tulous, are said to have been poisoned by it. But the fact has been questioned by some, and denied by others. See Apollodorus, lib. i. cap. 27. Strabo, lib. i. p. 106. Plutarch in Hannib. and Valer. Maxim. vol. vi. ext. 5.

Bull's gall, is an intense bitter, more pungent and acrimonious than that of any other animal; whence it is sometimes used to destroy worms.

Bull, bannal, denotes a bull kept by a lord, who has a right to demand all his tenants to bring their cows to be served by him.

Bull, free, according to Du Cange, signifies the same with bannal bull. Hence tauri liberis libertas; which, however, should rather seem to denote a privilege of keeping a bull independent of the lord.

Bulls, wild. The wild bulls, now so numerous on the continent of America, are said to have sprung from one bull and seven cows, which were carried thither by some of the first conquerors.

In the island of Hispaniola, the French buccaneers pursue bulls with dogs, and kill them with fire arms. See Buccaneers. At Buenos Ayres, the Spanish toradores chase them on horseback, armed with a long lance, at the end of which is a half-moon of sharp steel. Having drawn a number of the horned kind together, they let the cows escape, but dexterously take the bulls with their half-moons on the hind-legs, by which, disabling them from flight, they are easily dispatched.

Bull-baiting. See Baiting.

Bull-fighting, a sport or exercise much in vogue among the Spaniards and Portuguese, confining in a kind of combat of a cavalier or torador against a wild bull, either on foot or on horseback, by riding at him with a lance. The Spaniards have bull-fights, i.e. feasts, attended with fheaves, in honour of St. John, the Virgin Mary, &c. This sport the Spaniards received from the Moors, among whom it was celebrated with great eclat. Some think, that the Moors might have received the custom from the Romans, and they from the Greeks. Dr. Plott is of opinion, that the fourioned bulls amongst the Thessalians, who first instituted this game, and of whom Julius Cesar learned and brought it to Rome, were the origin both of the Spanish and Portuguese bull-fighting, and of the English bull-running. Nat. Hist. Staff. chap. x. § 76.

The practice was prohibited by pope Pius V. under pain of excommunication, incurred into fact. But succeeding popes have granted several mitigations in behalf of the toradors.

Mr. Gibbon, in his "History of the Decline and Fall of the Roman Empire," (vol. xi. p. 421.) has extracted from Muratori (Script. Rec. Ital. tom. 12.) an account of a bull-feast, which was celebrated in 1332, after the fashion of the Moors and Spaniards, in the Coliseum at Rome. The nobles were invited by a general proclamation, communicated as far as Rimini and Ravenna, to execute their skill and courage in this perilous adventure. The Roman ladies were marshalled in three squadrons, and seated in three balconies, which were lined on this occasion with scarlet cloth. When the company was collected and arranged, the lots of the champions were drawn by an old and respectable citizen; and they descended into the arena, or pit, to encounter the wild bulls with a single spear. Amidst the crowd, the annalist has selected the names, colours, and devices, of 20 of the most conspicuous knights. Several of the names are the most illustrious of Rome and the ecclesiastical state; the colours were adapted to their taffie and situation; and the devices are expressive of hope or despair, and breathe the spirit of gallantry and arms. The combat of the amphitheatre were dangerous and bloody. Every champion successively encountered a wild bull; and the victory may be ascribed to the quadrupeds, since no more than eleven were left on the field, with the loss of nine wounded, and eighteen killed on the side of their adversaries. Some of the nobles families might mourn, but the pomp of the ceremonies in the churches of St. John Lateran, and Maria Maggiore, afforded a second holiday to the people.

Similar combats with bulls in the amphitheatre, have been justly regarded as a striking feature of Spanish and Portuguese manners. Some have supposed that these spectacles, by rendering bloodshed familiar to the people, tend to deaden sensibility, and to make the national character ferocious and brutal. Others think, that they form an antidote to timidity, and as a means of cherishing resolution and valour. But theories of this kind are not justified by facts.
faits. Modern Italy, it is said, has no gladiators, but numer-
ous assailants; whereas ancient Rome had scarcely one
assailin, but whole armies of gladiators. As far as it re-
pects the national character, it seems to be of little mo-
moment, whether bulls be killed by butchers or by cham-
pions; and it is well known, that such spectacles have little or no
influence on the disposition, because they are attended by peo-
ple of all ages and stations, and yet they neither give
to the fede, and boldness to the timid, nor make
any alteration in the mildness of their manners. The bull-
ights of Spain and Portugal attract a crowd of spec-
tators, and yield very considerable sums of money to those who
undertake and conduct them, of which part is appropri-
ated to the purpose of defraying the expence of horses and bulls,
and of paying the hire of the toreros; and part is applied
to the support of religious and charitable establishments.
These entertainments have formed one of the chief funds of
the hospital at Madrid. The bulls that are selected for these
combats are of a peculiar breed, and the connoisseurs can rea-
dily distinguish by a view of them where they have been bred.
The arena, where these shows are exhibited, is a kind of circus
surrounded by ranges of seats, one above another; and the
highest of them is covered. The lower part of the edifice is oc-
cupied by boxes. At Valladolid, which has no circus appro-
priate to these sights, the principal square is converted into a
theatre, and the balconies of the adjoining houses are made to
project in such a manner as to accommodate the numerous
spectators that assemble on these occasions. The spectacle
commences by a kind of procession around the square, in
which the combatants appear both on horseback and on
foot; and they are preceded by two alguazils on horseback,
who are deputed to obtain of the president of the show an
order for its commencement. Upon a certain signal, the
animal appears; and the officers of justice by hastily with-
draw, give notice to the speculators that their cruel pastime
is about to begin. The bull is received, on his appearance,
with loud shouts; and the contest is begun by the
"picadors," who are mounted on horses and dressed in the
ancient Spanish mode, each of them being armed with a long
lance. To the honour of this part of the combat, which
requires strength, courage, and dexterity, several perfons of
rank occasionally aspire. When the bull darts upon these
combatants, without any previous irritation, his courage is
applauded; and if in spite of the pointed weapon which re-
false his assailant, he returns to the charge, the shouts of the
spectators are redoubled, and their joy seems to transport
them into enthusiasm; but if the bull is timid, and avoids
his persecutors, he is hoasted at and hissed by the speculators,
and insulted with reproaches and blows by those who are
near him. If these modes of provocation are insufficient to
rouse his ferocity, large dogs are let loose upon him, which
seize him in a furious manner by the neck and ears; and
which he teethes into the air, so that they fall to the ground
flamed, and sometimes mangled. At length, however, the
combat is renewed, and the animal, overcome by his affil-
ants, perishes ignobly. If the animal manifests spirit and
fierceness, the picador pierce him with their lances; and thus
irritated, he furiously attacks the horse which carries the
combatant, rips up his sides, and overturns him and his ri-
der. The picadors thus difmantled and endangered, are
relieved by other combatants on foot, called "Chulos," who
divert the animal's attention by shaking pieces of dif-
ferently coloured cloth before him; the provoked animal
purifies; and they escape merely by their agility. Some-
times they are under a necessity of throwing themselves over
a barrier that encloses the arena. When this barrier is
fingle, the bull pursuing the chulo, sometimes jumps over
Vol. V. it, and causes great consternation among the spec-
tators on the lower benches, so that in their precipitance for es-
caping, they suffer as much as they might have done from
the fury of the animal, who, however, becomes incapable
of this kind of pursuit. The picador, when effectually
reduced, mounts his horse, or if the first horse be killed or
become unfit for service, procures another, and continues the
combat. When the picadors have sufficiently tormented the
bull, they withdraw, and leave him to the irritation of the
combatants on foot. These latter, denominated "banderil-
eros," go before the animal; and when he aims at them,
they plunge into his neck darts, called "banderillas," with
hooked points, and ornamented with small streamers of col-
doured paper. The fury of the bull is now renewed; he
roars and tosses his head, and aggravates by the violence of
his motion, the pain occasioned by his wounds: and in this
situation, the agility of his adversaries is signalally displayed.
The danger that threatens them alarms the speculators; but ac-
customed to this kind of combat, they secure themselves
by their address and dexterity. When the vigour of the
bull is almost exhausted, and he is bathed with blood, and
the people are anxious to witness the combat of another vic-
tim, the president of the entertainment signals the signal of
death, which is proclaimed by the sound of trumpets. The
"matador" then advances; and holding a dagger in one
hand, he waves before his adversary with the other hand a
kind of flag. They both stop and gaze at one another;
and the speculators are again amused for some time by the
impetuousness of the bull, and the agility of the matador.
The assembled observers witness this scene in profound
silence: and the matador coolly dispatches the furious animal
by a blow, where the spinal marrow joins the head. The
death is bloodless and inanes, and deferves imitation,
as humanity would wish to save pain to the animals
slaughtered for food. When the animal falls, a thousand
voices proclaim with loud shouts the triumph of the con-
queror. If the blow is not decisive, and the bull survives,
murmurs succeed applause, and the matador is regarded
only as an unskillful butcher. When the tragedy termi-
nates, three mules ornamented with bells and streamers ap-
pear, and the bull is dragged by means of a rope tied
round his horns from the arena. Sometimes the bull is
pierced in various parts with lances, to which spurs are
fastened, which being set on fire, the maddened animal
stands pawing the ground while he draws in and exhales
volumes of smoke. Sometimes an American is introduced,
who, after the manner of hunting the wild bull in his own
country, throws a rope round the horns, and entangling him
as in a net, then kills him with perfect safety.

On each of the days set apart for these entertainments,
fix are thus sacrificed in the morning, and 12 in the af-
noon: at least this is the case at Madrid. The three last
belong exclusively to the matador, who, unaided by the
picadors, exerts his ingenuity to diversify the pleasures of
the speculators. The Spanish government are not inflexible
of the moral and political inconveniences arising from this spec-
ies of frenzy. So far from encouraging, they discourage
it, whilst it would be dangerous precipitately to abo-
lish it. The court itself formerly reckoned it among the
number of its festivals, which occurred at certain periods.
The theatre of them was the "Plaza-Mayor," and they
were honoured with the presence of the king and royal fa-
ymily; and his guards presided there in good order. His
halberdiers formed the interior circle of the scene; and their
long weapons, held out in a defensive posture, were the only
barrier which they opposed against the dangerous caprices
of the bull. These entertainments, which by way of ex-
cellence
bulls, that endeavoured to-polish the nation, and to direct the public attention to useful objects, was very defective of suppressing a tale from which inconvenience sprang; but he was too wise to employ violent means for this purpose. He, however, confused the number of bull-fights to those, the profits of which were applied to some charitable institutions, with a design of substituting to these other funds afterwards. Bull-fights being thus rendered less frequent, will, perhaps, gradually lose their attraction, until more favourable circumstances allow the entire abolition of them.

**Bull-running**, denotes a scandal custom obtaining in the honour of Tullbury in Staffordshire, where anciently, on the day of the Assumption of our lady, a bull was turned loose by the lord to the minds race, if they could catch him before he palled the river Dove, were to have him for their own, or, in lieu thereof, to receive each forty pence; in consideration of which custom, they pay twenty pence yearly to the lord. *Plat. Nat. Hist. Staff.*

**Bull and baw.**—By the custom of some places, the parson is obliged to keep a bull and baw for the use of his parishioners, in consideration of his having tithes of calves and pigs, &c. 1 Kol. Abr. 550. 4 Mod. 241.

**Bull-comber**, in Entomology. See *Scarabæus Typhæus*.

**Bull-dog**, in Zoology, a kind of mastiff upon a smaller scale; with a somewhat flatter front, and a greater ferocity of aspect. The bull-dog is remarkable for the unadorned and savage pertinacity with which he provokes and continues the fight; and when he has fixed his bite, is with much difficulty disengaged from his antagonist. This is the dog employed in the barbarous diversion of bull-baiting. See *Canis*.

**Bull's eye**, in Aeronautics. See *Aldebaran*.

**Bull's eye**, in Meteorology. See *Scarabæus Typhæus*.

**Bull's eye**, in Sea language, denotes a sort of small oval block without heaves, made of hard wood. It is turned in a lathe, has a groove round the outside, and an oval hole gouged through the middle. These blocks are used instead of blocks and iron thimbles; but, indeed, they are very seldom used at all.

**Bull-finch**, in Ornithology. See *Loxia Pyrrhula*.

**Bull-frog**, in Zoology. See *Rana Catesbiana*, and *Ocellata*.

**Bull-bay river**, in Geography, lies to the east of Port Royal, or Kingston harbour, in Jamaica, between Caney river and Four-mile wood.

**Bull and cow**, rocks near the south coast of Newfoundland. N. lat. 46° 55'. W. long. 53° 42'.

**Bull Sand**, lies about a league S. W. from the Spurn point, or eastern entrance of the Humber, on the coast of Yorkshire, between which and the point is a fine channel of ten or eleven fathoms.

**Bull's barrow and island**, or Seewc bay, lies on the coast of South Carolina, in North America, to the south-west from Cape Carteret. The entrance of the harbour, which is within the island, is at the N. E. end of it, having a small island within that: between them is a palaige, in N. lat. 32° 56', and W. long. 78° 24'.

**Bull-head**, in Geography, a cape of Ireland, on the north side of Dingle bay in the county of Kerry, near three miles S.E. of Dingle. W. long. 10° 4'. N. lat. 52° 6'.

**Bull-head**, in Ichthyology, is a trivial English name applied most commonly to that small kind of fish which we distinguish farther by the name of *river-bull-head*, (*Cottus Gobio Linna.*) Another fish of the same genus, *Cottus cataphractus* is called the *armad-bull-head*; this last lives in the ice.

**Bull-trout**, an English name for a fish of the salmon kind caught in many of the rivers of England; it is also called the *feur*. See *Salmo Trutta*.

**Bull-roar**, in Botany. See *Scirpus fluviatilis*.

**BULLIA, in Antiquity**, a golden ornament, of a globular figure, and generally supposed to have been hollow within, wherein was contained some amulet, to serve as a preservative from witchcraft and envy, hung about the neck by those who triumphed among the Romans; and also by the children of the patricians, and even *ingenii*, as a badge of their hereditary nobility and freedom, by which they might be animated to behave themselves in a manner worthy of their birth. Authors are divided in their opinions about the form of this ornament, which the Sabine women, in acknowledgement of that increase of wealth and power for which Rome was indebted to them, were allowed to hang about the necks of their children. Plutarch (in Romul.) says, that they resembled the little bubbles which are formed by the drops of rain, when they fall upon running water. Hence it has been inferred, that they were hollow and light; others think that they were half globes, flat on one side, and globular on the other. Some have supposed, that they were originally made in the shape of a heart, in order to prompt their wearers to the acquisition of wisdom; and others say, they were round, with the figure of a heart engraved on them. The form, in process of time, is said to have varied from a complete circle to that of a segment. Such was the shape of the golden bulla lately found at Manchecomber; and as this had no aperture by which an amulet could be introduced, Mr. Whitaker (Hist. Manchecomber, vol. i. p. 79) concludes, that they were not hollow; and he supposes, that they were intended at first rather as amulets than as ornaments; alleging that they were frequently impressed with the figure of the sexual parts. As to their origin, it has been affirmed by some, that they were first introduced by Romulus, and that he gave one of them to Tullius Hostilius, the first child born of the rape of the Sabines. Others ascribe the introduction of them to Tarquin the elder, who gave a bulla to his son, at the age of 1, together with the prætexta, because he had killed an enemy; and hence it was afterwards assumed by other patricians. But Macrobius says, that Tarquin extended the right of wearing this ornament to all the children of the patricians; and that accordingly he began with his own.

The bulla was not allowed to the children of slaves, or even of *liberti*, who, in lieu thereof, wore a leather collar round the neck, much after the manner of the purple ring to which the bulla was hung. But the great veltal, and the Roman ladies, wore a bulla; the former by way of ditionet, the latter as a piece of drefs. We may add, that bullae were sometimes allowed to statues; whence the phrase, "flature bullata." M. Lepidus, having killed an enemy, and faved a citizen, even when a boy, had a "bullated" statue erected to him in the Capitol, in memory of the exploit. The Roman youth laid aside the bulla, together with the "prætexta," and consecrated it to the Lares, when they arrived at their fifteenth year; as appears from the faction of the "cum primum":

"Cum primum pavido cullos mihi purpura celsit, Bullaque fuccinatius Laribus donata pependit." 

Perf.
BUL

**Bulla** was also a denomination given to divers other metallic ornaments made after the form of bulla.

In which sense, bulla seem to include all golden and silver ornaments of a roundish form, whether worn on the habits of men, the trappings of horses or the like. Such were those decorations used by the ancients on their belts and doors. Virgil, speaking of Pallas’s belt or girdle, says:

"Notis fulcruent cinqua bullis"

Pallantis pura.†

**Bullaria** is, in Conchology, a species of **Voluta**, the shell of which is cylindrical, very glabrous, reddish, with somewhat livid belts; spire obtuse; pillar-lip with four plaitts within; aperture oblique. Chemnitz. Inhabits the Indian seas.

**Bullata**, in Conchology, a species of **Solin**, the shell of which is roundish, inflated, and slightly pointed; anterior part of the shell retained open by the crenatures with which it is becet.—This shell inhabits the American seas, and it is believed those of India also. The shell is thin, somewhat pellucid, longitudinally striated, white, and spotted or clouded with purple. Hinge with a single tooth. Marginal teeth remote, compressed, and inserted in a kind of hollow in the opposite valve.

**Bullatus**, a species of **Conus**, the shell of which is yellow, clouded with white. *Linn.* Native place unknown. Adanson calls it **Potam**.

This shell is thin, sometimes of an uniform colour, but more frequently spotted, clouded, or striped; aperture of the mouth for the most part large, and blunt.

**Bulla**, in Geography, a town of Switzerland, in the canton of Fribourg, where the insurgents of Gryeres assembled in 1781, in order to concert measures for obtaining a redress of grievances; 10 miles S. of Fribourg. N. lat. 46° 40'. E. long. 6° 54'.

**Bullenmeer**, a town of Germany, in the circle of Wellphalia, and county of Oldenburg; 18 miles N. of Oldenburg.

**Buller**, Cape, a cape of South Georgia, to the west of the bay of islands, and about 7 leagues from Cape North, nearly E. of it. S. lat. 53° 58'. W. long. 27° 45'.—Allo, a cape on the coast of Terra del Fuego island, in S. lat. 53° 58'. W. long. 67° 45'.—Allo, a cape on the coast of New Britain, in the East Indian ocean. S. lat. 45° 56'. E. long. 157° 25'.

**Bullers**, or **Bouliers** of Buchan, a natural harbour, on the east coast of Scotland, about 6 leagues N. from Aberdeen, and 2 S. from Peterhead. It is only frequented by fishermen, and formed by a rock of an irregular oval form, projecting into the sea from the middle of the bay to the distance of 100 yards. Vessels of all sizes may shelter here from the weather; but landing is impracticable. It derives its name from boiling, on account of the turbulence of the water.

**Bullies**, a small town of France, in the department of the Oise and district of Clermont, seated on the river Brecue, and celebrated for its fine flax and linen; 2 leagues N. W. of Clermont.

**Bulllet**, an iron or leaden ball, or shot, wherewith firearms are loaded. Some derive the word from the Latin.

---

*Helix heliotoides*

**Bulla regia,** or **Bullaria** of Ptolemy, in Ancient Geography, a free town of Africa, on the route from Carthage to Hippo, between Simiutta and Nuce Aquilline. Anton. Itin.

**Bullace-tree**, in Botany. See *Prunus insititia*.

**Bullæum**, in Ancient Geography, a town of the Silures in Britain, placed by Camden at Bualt or Bulth in Brecknockshire, by Baxter at Caerphilly, and by Horshay at or near Uik in Monmouthshire: thus uncertain is its situation.

**Bullan-bay**, in Geography, a bay on the west coast of Ireland between the northern part of the Isle of Achill and the main land of the county of Mayo.

**Bullanspaur**, a town of Hindoostan, in the hilly country of Calhore, seated near the river Setle, 159 miles E. of Lahore, and about N. 26° E. 60 geographical miles from Sirhind. N. lat. 31° 31'. E. long. 76° 40'.

**Bullarii**, in the court of Rome, the makers or drawers of bulls or constitutions. See *Bull*.

**Bullary, Bullarium*, a collection of papal bulls.

We have extant divers kinds of bullaries; some containing only the bulls of particular popes; such are the bullaries of Innocent XII. and Clement XI. Others contain the bulls granted to particular communities; such is the bullary of the order of Cluny, &c.

A general bullary of all the papal constitutions from Gregory VII. to Sixtus Quintus, was compiled by order of pope Sixtus Quintus, in 1586; since which has been published a great bullary, by Laert. Cherubin, containing the bulls of all the popes from Leo in 440, to Paul V. in 1559; since continued by Ang. Cherubin to the year 1644, and by Ang. a Lantufca and Jo. Paulo to the year 1676; and, lastly, by an anonymous editor to the time of Benedict XIII. under the title of "Bullarium magnum Romanum." We have a few digested in a new method by Buochardus; a commentary on it begun by Vinh. Petra, and a summation of it by Novarius. Fabric. Bibl. Med. Avvi. Lat. lib. ii. tom. i. p. 816. 582.

**Bullata, in Conchology, a species of Voluta, the shell of which is cylindrical, very glabrous, reddish, with somewhat livid belts; spire obtuse; pillar-lip with four plaitts within; aperture oblique. Chemnitz. Inhabits the Indian seas.**
BULLETS, others from the Greek βαλλειν, to throw. Bullets are of various kinds, viz. red-hot bullets, made hot in a forge; intended to set fire to places where combustible matters are found. See Shot.

Hollow bullets are shells made cylindrical, with an aperture and a fuse at one end, which giving fire to the inside, when in the ground, bursts, and has the same effects with a mine.

Chain-bullets, consisting of two balls, joined by a chain three or four feet apart.

Branch-bullets, two balls joined by a bar of iron five or six inches apart.

Two-headed bullets, called also angels, being two halves of a bullet joined by a bar, or chain, are chiefly used for cutting of cords, cables, stakes, &c.

Quarter-bullets. See Quarter.

The diameter of a leaden bullet, weighing one pound, is 1.66 inches, according to Sir Jonas Moore; or by a table in Muller's "Treatise of Artillery" (p. 50), 1.672 inches; and the diameter of any other bullet is found by dividing 1.66 inches by the cube root of the number, which expresses how many of them make a pound; or by subtracting continually the third part of the logarithm of the number of bullets in the pound from the logarithm .2278867 of 1.66, and the difference will be the logarithm of the diameter required.

Thus the diameter of a bullet, of which 12 make a pound, will be found by subtracting .3597479, a third part of 1.0791812 the logarithm of 12, from the given logarithm .2278867; or because this logarithm is less than the former, an unit must be added, so as to have .2278867; and then the difference .861507 will be the logarithm of the diameter found, which is .738 inches, observing that the number found will be always a decimal, because the number subtracted is greater than the other.

We may also deduce the diameter of any bullet from its given weight, provided that the specific gravity of lead is known; for, since a cubic foot of lead weighs 11.25 pounds, and 67.8 is as 3.55 as the cube of a foot or 12 inches, i.e. 1728, to the content of a sphere, which is therefore 5929.7 ounces; and since spheres are as the cubes of their diameters, the weight 5929.7 is to 16 ounces, or one pound, as the cube 1728 is to the cube of the diameter of a sphere, which weighs 16 oz. or 1 lb.; which cube is 4.66263, and its root is 1.6796, the diameter sought.

By the rule above laid down is calculated the following table, shewing the diameters of leaden bullets, from 1 to 39 in the pound.

N. B. The upper horizontal column shews the number of bullets to a pound; the second, their diameters; the third, the diameters of those of 10, 11, 12, &c. and the fourth, those of 20, 21, 22, &c. and the last thereof of 30, 31, 32, &c.

The government allows eleven bullets in the pound for the proof of muskets, and 14.5 in the pound, or 29 in two pounds for service; 17 for the proof of carbines, and 20 for service; and 28 in the pound for proof of pistols, and 34 for service. The diameter of musket bullets differs but 1-50th part from that of the musket-barrel; for if the shot but infl rolls into the barrel, it is sufficient. Cannon-bullets or balls are of different diameters and weights, according to the nature of the piece.—See Caliber and Shot.

The first mention of iron-bullets in the "Faedera" occurs A.D. 1570, in an antiquity for delivery of the artillery and ammunition of Boulogne; and yet stone-bullets remained in use considerably later than this time.

According to Merians, a bullet, shot out of a great gun, flies 92 fathoms in a second of time, which is equal to 589.5 English feet; and, according to Huygens, it would be 25 years in passing from the earth to the sun; but according to some very accurate experiments of Dr. Derham, it flies, at its first discharge, 710 yards in five half-seconds; or about 7 miles in a minute; allowing therefore the sun's distance 95000000 English miles, a bullet would be near 26 years in its passage at the full speed.

Bullets shot into the water undergo a refraction; several experiments concerning which are given by Mr. Carré. Vide Mem. Acad. Scienc. ann. 1705, p. 277.

The extraction of bullets from wounds is an operation described by chirurgical writers. Bullets sometimes remain easy in the body during many years.

Swallowing of musket-bullets is sometimes practised to remove haemorrhage and colic pains. Mr. Young gives a case wherein this had a terrible effect: the bullet happening to miss its way down, instead of the osophagus, got into the trachea. Mr. Chirac has a dissertation on the question, which of the two is safer in like cases, to swallow leaden bullets, or crude mercury? He gives the preference to the bullets. Phil. Trans. No. 263.

Bullet-moulds consist of two concave hemispheres, with a handle whereby to hold them; and between the hemispheres is a hole, called a gate, at which to pour in the melted metal. The chops or hemispheres of bullet-moulds are first punched, being blood-red hot, with a round-ended punch, of the shape and size of the intended bullets. To cleanse the inside, they make use of a bullet-bore.

Bullet-bore, is a steel COX, having a globule at one end, wherewith to bore the inside of a mould, clean of the size intended.

Bullet-iron, a denomination given by some to Spanish or Swedish bars of iron.

DULLEYN, William, of a respectable family of the same name, in Suffolk, was born in the Isle of Ely, in the early part of the reign of Henry the eighth. At a proper age he was sent to Cambridge, which he quitted, probably after taking his bachelor's degree, and went to Oxford, where he applied himself to the study of medicine, and read the Greek and Arabian writers, in both which languages he appears to have been tolerably skilled. While resident there, he made excursions through the neighbouring countries, paying great attention to the plants that he had found recommended in the cure of diseases; and after taking the degree
degree of doctor, he extended his excursions, travelling over the greatest part of England and Scotland. He afterwards visited the continent, with the same view. On his return, he was made rector of Blaxhall in Suffolk, through the interest, probably, of his family, and practiced medicine there. On the accession of queen Mary, he removed to Durham, thinking it more safe, being a protestant, to live at that distance from the court. He lived here in great intimacy with sir Thomas Hilton, governor of Tintern fort, and became a scholar, or joint proprietor of the falt pans. Sir Thomas dying under his care of a putrid fever, he fell into such disgrace, that he found it necessary to remove from Durham, and Mary being dead, he came to London; but the vengeance of the family pursuing him, he was taken up, arraigned, and tried for the murder of his friend; and though he easily cleared himself from the imputation of this crime, he was continued in prison, at the suit of the prosecutor, the brother of sir Thomas, for a debt due to the family. While in prison, he tells us, he wrote the greater part of his medical works. Having at length discharged his debt, he returned to London, was made a member of the College of Physicians, and acquired considerable reputation for his skill in the practice of medicine, which he enjoyed to the time of his death, January 7, 1576. His recitory he gave up, at the time of his quitting Blaxhall. He was an ancestor, Granger says, of the late Dr. Stukely. There are two portraits of him, both cut in wood: the one a profile, with a long beard, published with his Government of Health, an octavo volume, 1548; the other a whole length, to his "Bulfinch's Bulwark of Defence against all Sicknes, Soarens and Wounds that do daily afflict Mankinde," fol. 1626. His last work is entitled, "A Dialogue, both plaintive and pietifull, wherein is a goodly Regiment against the Fever Petilence; with a Consolatation, and Comfort against Death," 8vo. 1654. In this work, not more than a seventh part of which, Dr. Aikin says, is on the subject of medicine, the author appears as a person of much humour, and fancy. Haller mentions a work by Richard Bulleyn, who was also, like our author, both a divine and a physician: "De Nephritis, ejusque Remedibus," which was published in 1592. These works, which are now only sought for by collectors, as speciments of the engraving, and printing of the time, passed through several editions, and doubtless contributed in rating the reputation of the writer. This shews the little progress our ancestors had then made in civilization and knowledge, as our author was no better informed than to imagine, that beards made of ebony might be successfullly worn as a charm against certain diseases, and that witchcraft was more hurtful in the realm than either quartern, pox, or pestilence; lamenting, 'that damnable witches should be suffered to live unpunished, while so many blessed men (protestants) were burned.' But these prejudices continued more than a century after his time; for in Charles the Second's reign we find doctor Chamberlain, then in high repute as an acconceur, factioning the folly of putting necklaces on children to facilitate dentition, and writing a treatise, to shew the manner in which the beads effected this purpose. Aikin's Biographical Memoirs of Medicine, &c.

BULLIALDUS, or BOULLIUS, ISMAEL, a celebrated astronomer and scholar, was born of protestant parents at Houdun in France, September the 28th, 1625; and having finished his studies in philosophy at Paris, and in civil law at Poitiers, he applied to mathematics, theology, rhetoric and profane history, and civil law, with such ability, that he became eminent in each of these departments, and acquired the reputation of an universal genius. As he had travelled for his improvement into Italy, Germany, Poland, and the Levant, he formed an extensive acquaintance with men of letters, and maintained a correspondence with the most distinguished persons of his time. Although he had been educated a protestant, he changed his profession at the age of 27 years, and became a catholic priest. His life was prolonged to his 80th year; and having retired to the abbey of St. Victor at Paris in 1689, he died there November the 25th, 1694. Besides his pieces concerning ecclesiastical rights, which excited attention, and the history of Duces, printed at the Louvre, in 1649, in the original Greek, with a Latin version and notes, he was the author of several other works, chiefly mathematical and philosophical. His "Treatise on the Nature of Light," was published in 1634; and his work entitled, "Planisphaerium, life de vero Systemate Mundii," or true system of the world, according to Philolaus, was printed at Amsterdam in 1658, and re-published in 1645, under the title of "Althromania Philelaisca," grounded upon the hypotheses of the earth's motion, and the elliptical orbit described by the planet, illustrated with various methods of demonstration. To this work were added his "Tabula Philolaicae," much approved and recommended by Riccioli, who style the author "Althromus profundus indagator." Upon examining the hypotheses, or approximation of bishop Ward, he found that it did not agree with the planet Mars; and in his defence of the Philolac astronony against the bishop, he shewed that from four observations of Tycho on the planet Mars, this planet in the first and third quarters of the mean anomaly was more forward than it ought to have been upon Ward's hypothesis; but that in the second and fourth quadrants of the same, the planet was not so far advanced as that hypothesis required. He therefore undertook the correction of the bishop's hypothesis, and made it more conformable to the orbits of the planets, which were most eccentric, and introduced what Street has called in his "Caroline Tables," the "Variation." For these tables were calculated by means of the correction of Bullialdus, and were thus more accurate than any which had preceded them. Dr. Gregory declares this correction a very happy one, considered as a correction of an approximation to the true system; for we are thus enabled to deduce the coequant, or true anomaly apriori and directly from the mean, in a manner very well corresponding to the observations; which no one, says Mercator, had effected before. Bullialdus, while he makes every planet move in an ellipse, supposes it to be such a one as if cut out of a cone, would have the axis of the cone pass through one of its foci, or that next the aphelion. See Gregory's Alton, lib. iii. prop. 7.

In 1644 Bullialdus published a translation of "Theo, the Plutonius of Smyrna," with notes; and in 1657 his treatise "De Lineis Spiralibus, Excric. Geom. et Alton.," Paris, 4to. In 1663 he published a treatise of "Pтолemvos de Judicandis Facultatis," and in 1682 appeared at Paris, in folio, his large work, entitled "Opus Novum ad Arithmet. Infinitorum," being a diffuse amplification of Wallis's Arithmetick of Infinities. Upon being consulted by M. Thouand concerning the appearance of the moon in the month of March, and 33rd year of the christian era, he made the requisite calculations, and replied, that it could not have been seen in Judea till the 19th of that month, and that it was probable that Jesus Christ was crucified on the 3d of April of the same year. Bullialdus also published two admonitions or notices to astronomers; the first, concerning a new star in the neck of the whale, sometimes appearing, and sometimes disappearing; and the second, concerning a nebula in the northern part of Andromeda's girdle, which
had not been discovered by any of the ancients, and which is subject to periodical changes. Moreli, Martin.

BULLIG, in Geography, a rocky shoal in the Atlantic near the west coast of Ireland; it is about half a mile S. of Carrick-a-island near Carlin head, in the county of Galway. W. lon. 5° 47'; N. lat. 53° 17'.

BULLIMONY, or Bollimong, denotes a mixture of several sorts of grain, as oats, peas, and vetches, called also maflin, or mong-corn.

BULLINGER, Henry, in Biography, a Swiss reformation, was born in 1504, at Bremgarten, on the borders of the canton of Zurich; and educated at Emmerick in the duchy of Cleves, whither he was sent by his father at the age of 12 years, and where he was supported for three years by the alms he procured for singing from door to door. Having been accustomed to the mortification and hardships attendant on this mode of subsistence, he entertained thoughts of entering among the Carthusians. But diverted from this resolution by the admonitions of his elder brother, he removed to Cologne at the age of 15 years, and devoted himself to the study of the school-philosophy, and of classical literature. About this time his attention was directed to the writings of Melanthon, and other reformers, the perusal of which produced a dislike of the doctrines of the Roman church, though he did not yet separate from it. Having finished his studies at Cologne in 1522, he returned to his father's house, and in the following year he was invited by the abbot of La Chapelle, near Zurich, to be a teacher in his convent, into which the reformation of Zuingli was introduced in 1526, principally by his influence. Attaching himself to this reformer, he accompanied him to the conference held at Berne in 1528; and he afterwards settled as a reformed pastor at his native place. In 1531, after the victory obtained by the catholic cantons over the protestants, he was obliged to retire to Zurich, where he succeeded Zuingli, who had lost his life in the battle. In this situation he applied with affinity to his ministerial labours and his studies, and edified his church by his writings as well as by his sermons. When Bucer attempted to reconcile the Lutherans and Zuinglians, by introducing a kind of middle doctrine with regard to the eucharist, he counteracted his efforts; and he was appointed by the Swiss churches in 1545 to reply to the harsch commentaries, which were published by Luther against his doctrine respecting the sacrament. In 1549 he concurred with Calvin in drawing up a formulary, expressing the conformity of belief which subsisted between the churches of Zurich and Geneva, and intended, on the part of Calvin, for obviating any speculations that he inclined to the opinion of Luther with respect to the sacrament. In the same year he urged many reasons against renewing the subfidiary treaty between the protestant Swiss and Henry II. king of France, and by his influence the proposal for this purpose was rejected. Among other arguments, he urged upon their consideration, "that it was not lawful for person to hire themselves, in order to kill those who had done them no wrong;" a position, which, however consonant to the principles and spirit of christianity, many professed believers have too frequently disregarded. Bullinger afforded kind assistance to the English divines who fled into Switzerland from the persecution of queen Mary; and he drew up a confutation of the pope's bull that excommunicated queen Elizabeth, which has been translated into English. He also persuaded the magistrates of Zurich to erect a new college in 1558; and he prevailed with them to establish a school, on the site of an old nunnery, in which 15 youths were taught and maintained, free of expense. In 1551 he wrote a book, the purport of which was to shew, that the council of Trent had no other design than to oppress the professors of sound religion; and, therefore, that the cantons should pay no regard to the invitations of the pope, which solicited their sending deputies to that council. In 1571 he commenced a controversy with Buresius concerning the ubiquity of the body of Christ, zealously maintained by the one, and as vehemently opposed by Bullinger, which continued till his death, that happened on the 17th of September, 1575. Besides a great number of printed works, amounting to ten volumes, he left several pieces in manuscript. Although Bullinger had been once married, and had eleven children, he was blamed for not taking another wife, when he became a widower at the age of fifty; such was the importance annexed by the first reformers to the communal plate, especially with regard to ministers, as it afforded a manifest proof of their renunciation of popery. Gen. Dict.

BULLION, denotes gold or silver in the mass or billet, before it is coined. 9 Ed. III. f. ii. e. 2.

The word is apparently formed from the French billet, a mass of gold or silver below standard, which Du-Cange derives farther from bulla, as being bulla aureum aut argentinum in manu juxta billem, i.e. baculum conflatum.

The term is applied to these metals, either when smelted from the ore, and not perfectly refined, or when re-refined, and melted down in bars, or ingots, or any unwrought body of a certain degree of fineness. In order to render gold and silver fit for use, it is necessary to reduce and harden them by an alloy of some base metal: and the quantity of this alloy is ascertained by the legislative regulations of different countries, so that the proportion of the one to the other may constitute the standard silver of such countries. According to the laws of England all forts of wrought plate should be made in conformity to the legal standard; and the pieces of standard gold and silver, regulate the value of the bullion, consisting of ingots, bars, dust, or foreign specie; consequently, in order to ascerntain the value of bullion, it is first asayed. See ASSAY. See also GOLD and SILVER.

Silver bullion is sometimes also denominated plate.

Silver and gold, whether coined or uncoined (though used for a common measure of other things), are no lefs a commodity than wine, tobacco, or cloth; and may, in many cases, be exported as much to national advantage as any other commodity.

In all great commercial countries a good deal of bullion is alternately imported and exported for the purposes of foreign trade. This bullion, as it circulates among such countries in the same manner as the national coin circulates in every particular country, may be considered as the money of the great mercantile republic. Whilst the national coin receives its movement and direction from the commodities circulated within the precincts of each particular country, the money of the mercantile republic derives its movements from those that are circulated between different countries. Both are employed in facilitating exchanges, the one between different individuals of the same, the other between those of different nations. However, the importation of gold and silver is not the principal, much less the sole benefit which a nation derives from its foreign trade. It is, indeed, part of the business of foreign commerce to supply countries which have no mines with the gold and silver that are wanted in them: but this is, comparatively, a very insignificant object; nor is it by the importation of gold and silver, that the discovery of America has enriched Europe. But by opening a new and inexhaustible market to all the commodities of Europe, it gave occasion to new divisions of labour and improvements of art, which, in the narrow circle of the ancient
cient commerce, could never have taken place for want of a market to take off the greater part of their produce.

Gold and silver, according to Mr. Locke, are the most solid and substantial part of the moveable wealth of a nation; and to multiply these metals should, he thinks, on that account, be the great object of its political economy. Countries that have political connections with foreign nations, and that are obliged to carry on foreign wars, and to maintain fleets and armies in distant countries, and to subsidize foreign princes, are under a necessity of sending money in some form or other, abroad; and therefore it has been said, that in time of peace it should endeavor to accumulate gold and silver, that when occasion requires, it may supply the means of carrying on foreign wars. Upon these popular principles, all the different nations of Europe have studied, though to little purpose, every possible means of accumulating gold and silver in their respective countries. Spain and Portugal, the proprietors of the principal mines which supply Europe with those metals, have either prohibited the exportation of them under the severest penalties, or subjected it to a considerable duty. The like prohibition seems anciencty to have made part of the policy of most other European nations. But when those countries became commercial, the merchants found this prohibition extremely inconvenient, and renounced it against it, as hurtful to trade. They represented, first, that the exportation of gold and silver, in order to purchase foreign goods, did not always diminish the quantity of those metals in the kingdom, but might frequently increase that quantity; because those foreign goods, if not consumed in the country, might be re-exported, and sold in foreign countries for a profit, which would bring back with it the treasure originally sent out for the purchase of them. They, moreover, reprented, that this prohibition could not hinder the exportation of gold and silver, which, on account of the smallness of their bulk in proportion to their value, could easily be smuggled abroad. These arguments produced the withers-for effect; and the prohibition of exporting gold and silver was retracted in France and England to the coin of those respective countries. The exportation of foreign coin and bullion was made free, and the first law for this purpose in England was passed in 1662. In Holland, and in some other places, this liberty was extended even to the coin of the country. A country that has no mines of its own, must undoubtedly draw its gold and silver from foreign countries; and, on account of their small bulk and great value, they are as easily transported as obtained. When the quantity of gold and silver imported into any country exceeds the effectual demand, no vigilance of government can prevent their exportation. All the fanguinary laws of Spain and Portugal are not sufficient for keeping their gold and silver at home. As they are easily transported from places where they abound, to those where they are wanted, their price does not admit of the same fluctuation with that of many other commodities, that are not so conveniently and speedily removed. The changes which take place in their value are generally slow, gradual, and uniform.

Instead of accumulating gold and silver, with a view to the augmentation of the real wealth of the country, Dr. Adam Smith (Wealth of Nations, vol. ii. p. 157.) recommends their being considered, under whatever form they exist, as utensils; and increasing the use for them, by increasing the consumable commodities, which are to be circulated, managed, and prepared by means of them, as the most effectual and most certain method of increasing their quantity, which will ever keep pace with the use to which they are applied; and beyond this, no law can ever prevent their being immediately sent out of the country. He adds, that it is not always necessary to accumulate gold and silver, in order to enable a country to carry on foreign wars, and to maintain fleets and armies in distant countries. Fleets and armies are maintained, not with gold and silver, but with consumable goods: and the nation, which, from the annual produce of its domestic industry, from the annual revenue arising out of its lands, labour, and consumable stock, has wherewithal to purchase those consumable goods in distant countries, can maintain foreign wars there. See Coin and Money.

Bullion is also used for the place where the king’s exchange is kept: or where gold and silver are brought in the lump to be tried or exchanged.

BULLIT’S LICK, in Geography, a salt-spring lying in Salt river, in Kentucky, America, and giving name to the river. It is distant 20 miles from the rapid of the Ohio, near Saltburgh, and is the finest spring that was worked in the county.

Bulloch-More, a rocky shael, about a quarter of a mile long from call to well, which lies above a mile W. of St. John’s point, in the mouth of Killibeg’s harbour in the well of Ireland: the keat water in it is fix feet. Mc-Kenzle.

Bulloch, in Rural Economy, the male of the cattle kind of animals, after being cultured. It is the fame with ox. Animals of this kind are generally termed bullocks from two to live, fix, or more years old.

The author of the “Synopsis of Husbandry” has observed, that in bullocks “a smooth coat and healthy countenance are proofs of their kindly disposition,” and that they will not deceive the buyer in the future progress; whereas, a drooping countenance, a hank belly, and a fusing coat, may be considered as unfavourable circumstances, and certain indubitable signs, either that such beasts are unhealthy, or by nature unprofitable.” Besides these, much depends on the form and construction of the animal: “a close well-fitted bullock, with a large dewlap, stout legs, deep chest, broad buttocks, and thick flank, will rarely deceive the purchaser; whereas those of a contrary shape, loose-jointed, long-legged, with a prominent back-gone, great length of body, short buttocks, and a belly tucked up, though to appearance larger than the first mentioned, are not likely to pay so well for their meat, and will be found much lighter in the scale from these defects.”

Fattening bullocks, it is observed, “require to be faddled with hay in the fummer of the winter months, and for this feaon it is always a prudent measure, where it can be done, to lay in for mowing a certain portion of marsh or other good grazes land, that there may be no want of fodder in the winter and fpring of the year; for it is in March and April, if those months turn out to be unpropitious, that flock of every kind is more apt to suffer than in the depth of winter; and when young bullocks become much reduced in flesh at that seaon, it is a very difficult task to raise them, and they will continue during the proceed of their fattening, to betray marks of the check they met with in their youth, so as never to arrive at the weight when fattened, that they would have done if they had not been suffered to pitch in the early stage of their life.”

Good water is likewise a very effential requisite in feeding horned cattle; and such grazers will never find their account in setting about this busines, whose grounds do not abound with a continual and plentiful supply of it; nor will the beasts thrive on dry lands, though the grazes should be in the largest abundance, for bullocks require a large quantity of water to dilute their victuals, and delight in the fummer time to chew the cud in pools or rivulets, where they may enjoy a cool

give too large a quantity at one time; and if any of the left
serving should casually remain in the troughs when the bai-
ting time comes round, these must be removed for a fresh
supply. The hay too, which is allowed to these beasts,
either when fed with turnips, or on oil-cake, should be the
sweetest that can be got, and be apportioned out to them
in small quantities. Turnips are more palatable, and likewise
more nutritious, when given to the beasts drawn fresh out
of the field; but to guard against the contingency of a
frost, or of incessant rains, the first of which would render
this business impracticable, and the other inconvenient;
it seems a very judicious method to provide a flock of turnips
in dry open weather, that they may be in readiness at those
times when they cannot be procured fresh carted out of the
field. Thence, when deepd of their leaves and top roots,
and cleansed from dirt, may be piled up in a covered shed,
where no moisture can penetrate, and, in this manner, main-
tain their goodnies for some length of time.

When bullocks are at first shut up to fatten on turnips,
care should be taken that this food is given in moderation,
and with a proper allowance of hay; otherwise, the sweet-
nness of the turnip may tempt the beast to feed so voraci-
ously, as to occasion too great a fullness in the maw,
which is called hoving, or blowing, an accident which fre-
quently happens to ruminant animals, when taken from dry
meat or natural grass to turnips, clover, or other succulent
kinds of food. See HOVEN.

Sometimes accidents happen to bullocks, when feeding
on turnips, from pieces slipping into the throat and stick-
ing there. To prevent suffocation, which would fre-
quently be the consequence in such cases, the outside of the gullet
should be rubbed down with a flick in order to force the piece
down into the stomach; or, should it fail, a turned
flick, or piece of cane formed so as to make a kind of pro-
bang may be introduced into the throat, and the turnip by
that means be removed. See STALL-FEEDING.

By some, the black, red, and brindled bullocks are con-
cidered as most hardy, and better disposed to fatten than
those of other colours. See CATTLE and LIVESTOCK.

Bullock’s eye, in Architecture. See Eye.

Bullock’s Heads, in Rural Economy, the houies in which
bullocks are kept while feeding. In the construction of these
buildings, attention should always be had to their being well
aired, to the facility of feeding and cleaning the animals in
them, and to their being kept dry and clean by their hav-
ing suitable drains and conveniences for urine and dung.
In the rural economy of Norfolk, Mr. Marshall remarks, that
a bullock-house there, consists of a central building, thirty-
three feet long, nineteen feet wide, and about eleven feet high
to the eaves, with a pair of wide folding doors at each end,
and a lean-to on each side, the whole length of the build-
ing, and eleven feet wide. The central building is the tur-
nip-house; the lean-toes, shed for the bullocks, which stand
with their heads toward, or rather in the turnip-house, from
which they are parted by a range of mangers only; hav-
ing the full freedom of breathing in its spacious area. By open-
ing the doors at each end, a sufficient degree of air and
coolness may be given in close weather, while, behind, the
eaves of the sheds are brought down to within five feet of the
ground, and are boarded with rough boards, except an opening at each end for the bullocks to creep in at, to pre-
vent too great a coldness in severe weather, thus preferr-
ing a due temperature. The shed of these dimensions,
thus constructed, holds twenty bullocks, ten on each side,
fattened by the neck, with chains, twines and rings playing
freely upon pofts seven feet high. At each corner of the tur-
nip-house, is a triangular bin for containing the topped and
tailed turnips, or other provisions.

In autumn, it is farther observed, the entire building is
sometimes used as a temporary barn for buck-wheat, peas,
&c. and in summer the centre part is an excellent waggon-
hed: had the doors been made a foot and a half higher, it
is suggested that it would have been an admirable refuge for
loads of corn or hay in a showery harvest. The main build-
ing is covered with reed, the lean-toes with tiles. And in
the rural economy of Gloucestershire, the same writer re-
marks, that each bullock has a hovel and a yard to himself,
in which he goes free, occupying them by turns, as ap-
petite or amusement directs him, having a manger and a drink-
ing trough to go to at pleasure; of course, he eats when he is
hungry, and drinks when he is thirsty. He is also fiffent liberty
to rub or to lick himself, as well as to keep his body in a proper
degree of temperature as to heat and cold. Theory, says Mr.
Marshall, could not readily suggest more rational principles.

The construction of these, however, varies in the minute.
The water trough, for instance, is sometimes placed by the manger in the hovel or shed, sometimes in the open
pen. Other less noticeable variations may likewise be seen
in different buildings. But the plan and dimensions, which
at present seem to lend highest in esteem, and on which se-
veral elevations of this nature have been made within the last
fifteen or twenty years, are the following: The building fifteen
to fifteen feet and a half wide within, and of a length propor-
tioned to the number of stalls required: the height of the
plates five feet to fix feet four inches, supported on the side
to the north or east by close wailing; on that to the south
or west by posts, set on stone pedestals: the gables wailing:
the covering plain tiles on a single pitch-roof: against the
back wall is a gang way, three and a half to four feet wide,
formed by a length of mangers, three feet to three and a
half feet wide, from out to out, at the top narrowing to about
fifteen inches within at the bottom: the perpendicular depth
fourteen or fifteen inches; the height of the top rail from
the ground, about two feet nine inches: the material two
inch plank, stayed and supported by posts and crofs
pieces, and stiffened by strong top-rails: the dimensions of
the area of the covered stalls, about eight feet three
inches square: of the open pens the fame. The partitions
between the stalls are of broad nails, flowing from the
outside pillars to similar posts, rising on the inner or stall
side of the manger, and fixed at the top by slender
beams, reaching across the building, each stall, or each
partition, having a beam and a pair of principals. The par-
titions of the pens are gates, reaching from the pillars to
the boundary wall; and likewise from pillar to pillar. When
they are fixed in that situation, each bullock has its stall
and its little yard. When in this, each is shut up in his
stall, the yards form a lane, or driftway, for taking in or
turning out any individual. The boundary wall of the pens
is about four feet high, coped with blocks of copper-drofs.
On the outer side of it is a receptacle of manure; on the
inner, a range of water troughs, with a channel of communica-
tion for the convenience of filling them. The materials
of the troughs, are stone; of the channel, gutter-bricks, cov-
ered with slabs. Thefe stone troughs, which are about
fourteen inches by two feet six inches within, have a conven-
ience in their construction, which is entitled to notice; in-
fed of the sides and ends being all of them pecked down
to an angle, square with the bottom, one of the ends is left
bevelled, sloping, making a very obtuse angle with the bot-
tom. This simple variation renders them easy to be cleaned,
either with the shovel or the broom.

Vol. V.
The floor is paved with hard burnt bricks, laid edgewise in mortar, being formed with a deep defect from the wall to a channel, from three to four feet from it, and with a gentle fall from the manger to the same channel, which becomes the general drain for rain water and urine. At one end of the pens is a pump (where a natural till cannot be had) for supplying the troughs of water; and, at the other, a lack of fluble for litter, which is used in the flall only, the yard being left untittered. At one end of the building is a cake box, at the other the rick-yard; with a door at each end of the gongway to receive the hay and the cake.

In some instances, he has a double range of flalls on this plan, the area between them being the common receptacle for the dung. When a number of flalls, as twenty or thirty, are required, their arrangement brings them within a convenient compass, and the two ranges, with a proper aspect, become flitter to each other. Beside these box flalls, there are others built nearly on the same plan, but without gates, and on a somewhat smaller scale, in which the cattle are fastened to the manger, or the partition pots, with a long chain, which gives them liberty to rub and lick themselves, and move about in their flalls. In this case, a water-trough is generally placed at the end of every second partition, level with the manger, with a general pipe of communication to fill them, each trough supplying two bullocks. This plan, he observes, lessens the expence in some degree, and prevents the bullocks from fouling their mangers. In the Cotwold hills, he remarks, that each bullock has different troughs, a small one for corn, a larger one for hay, with a water-trough, which runs the whole length of the shed, and is covered by a board, each bullock having a hole to drink at. There are various other constructions of sheds for this use, which will be more particularly described under their proper heads. See CATTLE-SHEDS, and FEEDING-HOUSES.

BULLOCK's flalls, the parts that are partitioned off in the sheds, in which the bullocks stand to eat their food. They should always be made sufficiently roomy. See CATTLE-SHEDS.

BULLOCK, in Geography, a new county of the state of Georgia in America.

BULLOCKS' point and neck, lie on the eastern side of Providence river, in the state of Rhode island.

BULLIS, bay of, lies on the north of Cadiz in Spain, within Rota point, and affords a fine shelter from the N.W. to the N.E. winds; about N.N.W. from Cadiz-bay.

BULLS, bay of, or Boulout bay, a noted bay on the east coast of Newfoundland island, about six leagues to the south of St. John's harbour. It has 14 fathoms of water, and is very safe, being land-locked. The only danger depends upon a rock, 20 yards from Bread-and-Cheese point, and another with nine feet water off Magoty cave. N. lat. 47° 20'. W. long. 52° 20'.—Another bay of the same name lies on the west side of Trinity bay, running so far well, that it is scarcely three miles over land from the head or bottom of it to the bay of Placentia.

BULLSKIN, a township of Fayette county in Pennsylvania.

BULLULLOS, a town of Spain, in Andalusia, four leagues from Lucena.

BULLY, a town of France, in the department of the Lower Seine; six leagues N. of Rouen.

BULLY-tree, in Botany. See ACERS and BUMELIA.

BULMAN, in Geography, a rock or shoal on the east coast of Ireland, on which there is never less water than four feet. It lies near Hangman's point on the east side of the entry into Kinfale harbour, and must be carefully guarded against by those who enter that port. N. lat. 51° 40'. W. long. 8° 28'.

BULN Monou, a county of Africa, on the coast of Guinea.

BULONGA island, lies off the mouth of Aracan river, on the east side of the bay of Bengal.

BULSEDI, a town of Arabia, in the county of Yemen, 22 miles S. E. of Lohëa.

BULTEAU, Lewis, in Biography, a learned and pious French author, was born at Rouen in 1615, and succeeded his uncle as king's secretary, which office he occupied for 14 years, till he withdrew from it to study and religious retreat. Having entered as a lay-brother among the Benedictines of St. Maur, he passed the remainder of his days at the abbey of St. Germain des Prés, near Paris. His principal works were "An Essay on the monastic History of the East," 1685, 2 vol. 4to. "Translation of the Dialogues of Gregory the Great," with Notes, 1689, 2mo. His modelly would not allow his annexing his name to his works; his style was formed on the model of the writers of the Port Royal; and his knowledge of languages was very extensive. He died of an apoplexy in 1693. Nouv. Dét. Hist.

BUTELI, derived from the barbarous Latin butelleum, or butellum, a scare, or boulter, denotes the bran or refuse of meal after drifing.

BUTELI also denotes a bag wherein meal is dreffed, called also a butler, or rather boulter. See BOLTERS.

BULTER-clotb. See Bolting-clotb.

BULTERS, are strong lines, five hundred feet long, with sixty hooks, eight feet asunder, and batted with pilchards or mackerel, which are used on the coast of Cornwall in the fishery of eelers. They are funk to the ground by a flone fastened to them; and sometimes such a number of these are tied together as to reach a mile.

BULWARK, Propugnaculum, in the Ancient Fortification, amounts to much the same with bastion in the modern. See Bastion, and also Rampart.

BULWER, John, in Biography. This writer, who lived in London, and was in repute in his time for his skill in teaching deaf and dumb persons, and others, to communicate their thoughts, by motions of their fingers and hands, is now only known by his works, which are sufficiently singular to merit attention: viz. "Chirologia, or the Natural Language of the Hand; as also Chironomia, or the Art of Manual Rhetoric." London, 1644, 8vo. Rabelais gives an account of a curious contell of this kind, where the disputants, without speaking, communicated their opinions, by motions of the hands and fingers. The art is not entirely lost, but is now principally practised as an amusement by young people at schools. "Pathomatomyia, or the significant Mufcles of the Palpions of the Mind, and Différence of the Mufcles of the Affections," London, 1649, 8vo. He describes the mufcles of the head, and denominates them from the expression in the countenance, occasioned by their contractions, as love, fear, rage, &c. "Man transformed, or the Artificial Changeling, shewing the several Ways how divers People alter the Natural Shape of some Parts of their Bodies," 1653, 4to. Joseph Clark, the famous pasture-mutter, was a remarkable instance of a man possessing this power. He made himself tall or short, fat or lean, deformed or straight, at his discretion. He had also an equal power in altering his countenance,
countenance, so as to be unknown to his most intimate acquaintance. Haller. Bib. Anat.

BULZIG, in Geography, a town of Germany, in the electorate of Saxony, 2 miles S. of Zohna.

BUM-bailiffs, or Bound-bailiffs. See Bailiffs of Sheriffs.

Bum-baum, in Sea-Language. See Bant.

BUMALDA, in Botany. Thumbl. nov. gen. p. 63. 

B. trifoliata. A small dense shrub, smooth in all its parts. Branches cylindrical or obtusely angular, jointed, purple. Branchlets opposite, leathery, thread-shaped, much spreading, in other respects similar to the branches. Leaves opposite, petiolated. Leaflets ovate, acuminate, finely serrated, pale underneath; on short, capillary, spreading or reflexed petioles. Racemose terminal. Native of Japan.

BUMBUNNY, a name given by the people of Guina to a plant common in that place, which serves them as an emetic; they boil a few of the leaves in water, and drink this liquor, which works very easily. Phil. Trans. No. 232.

Gen. Ch. Col. Perf. fifth leaf alternate. Leaves rounded, ovate, incumbent, concave. Cor. one petal, five-cleft or five-parted; tube very short, round; border five-parted; segments ovate, entire, spreading, concave, with two little scales at the base of each; nectary with five leaves, smaller than the segments of the corolla, at the base of the filaments, surrounding the germ, acute. Stam. filaments five, the length of the tube, inserted into its bottom between its looser segments; anthers ovate, erect. Fil. germ funiculare, ovate; style thick, erect, shorter than the filaments; stigma obtuse. Drupa oval, kernel single, oblong, smooth, with a lateral scar.

Eff. Char. Corolla five-cleft; nectary five-leaved; drupe one-seeded.

La Mark says, that all Swartz's species should be referred to Sideroxylum, which he describes in his "Illustrations" as submonopetalous, or, as he expresses it in the alphabetical part, having from one to five flowers. Bumelia, a separate genus, differs from Sideroxylum only in the number of flowers. Willdenow enumerates the following twelve species, all natives of America.

B. pallida. Swartz. "Leaves terminating, elliptic, obtuse; peduncles crowded, lateral; branches erect." It resembles B. nigra, but is a smaller tree, with whitish bark, having branches less spreading, with larger flowers and drupes. Swartz. Native of Jamaica.

B. teuma. Wildd. (Sideroxylon teuma. Linn. Mant. Chryophyllum carolinense Jacq.) "Leaves obovate, obtuse, filary, very-tomentous underneath; peduncles axillary, crowded." A tree 20 feet high, with a whitish bark, and very tenuous branches. Corolla alternate, each producing numerous one-flowered peduncles, about an inch long. Leaves five or six, below or among the peduncles, petiolated, very entire, deciduous. Flowers small. Calyx ovate; leaflets five, ovate, obtuse, the outer ones broader, convergent. Corolla tube the length of the calyx; border five-parted; segments ovate, shorter than the calyx; nectary in the throat of the corolla, five-parted; segments with three clefts, the middle one generally the longest. Stamens the length of the corolla. Fil. germ pentagonal; style and stigma simple. Drupa oval, kernel ovate, thinning, with two apertures at the base, sepa- rated by a bowed partition. It varies with very short spines, thinly scattered on the branchlets. Linn. Observed by Dr. Garden in the dry parts of Carolina. 4. B. retusa, mountain basilaid bully-tree. Swartz. (Achras 7. Brown. Jam.) "Leaves wedge-ovate, obtuse, rigid; peduncles crowded, axillary." Native of Jamaica. 5. B. falcifolium Wildd. (Sideroxylon falcidifolium Linn. Mant.) "Leaves lanceolate-oblong, obtuse, a little engonate; peduncles crowded, axillary. A shrub, 12 feet high. Leaves rather alternate, thinning. Peduncles one-flowered, numerous. A native of St. Domingo. 6. B. falaisfolia, Swartz. (Achras falaisfolia. Linn. Sp. Pl. under which name it has already been given in this work. La Marek refers his Sideroxylum falaisfolium to the Achras falaisfolium of Lambs with a mark of doubt. Willdenow gives, as a synonym to the present plant, Jacquin's Sideroxylon multichodendrum, which La Marek has inferred in his Illustrations, but not in the Dictionary under the same name). "Leaves lanceolate, ovate, acuminate; peduncles crowded, axillary and lateral." Native of Jamaica and the Bahamas islands. 7. B. mangillo, Wildd. (Sideroxylon mangillo La Marek End. Chryophyllum mangillo La Marek Illust. Duhemich mangillo Domb. Peruv. Mangillo Juff. 151). "Leaves oblong, obtuse, smooth, with whitish beneath; flowers axillary and lateral, aggregate, with short peduncles." An evergreen shrub, 10 or 12 feet high. Leaves alternate, very entire. Flowers small, white, in numerous small fasicles, either in the axils of the leaves, or scattered below the leafy part of the branches. Peduncles short. Style none. Fruit about the size of a small grain of pepper. Observed by Dombey in the neighbourhood of Limn. 8. B. montana, Swartz. "Leaves oblong, obtuse; peduncles long, axillary, distinct." Native of Jamaica. 9. B. nervosa, Wildd. (Chryophyllum macrophyllum Lam. Illust. C. eainfo Aub. guin.) "Leaves alternate, oval, of a different colour beneath; flowers aggregate, lateral, and axillary, tumescent, peduncled." Native of Cayenne. 10. B. pentagona Swartz. "Leaves lanceolate, acuminate, thinning; peduncles axillary; drupes pentagonal." Native of the West Indies. 11. B. rotundifolia Swartz. "Leaves roundish, red gined, veined, leathery, smooth on both sides." Native of Jamaica. 12. B. cuneata. "Leaves wedge-obovate." Native of Jamaica. Fruit of this and the preceding unknown.
BUN

BUN, BUN, or Boonk'in, in Sea Language, a short boom or bar of timber, projecting from each bow of a ship, to extend one edge of the forecastle to windward; for which purpose there is a large block fixed to its outer end, through which the rope is passed that is fastened to the lower corner of the fall to windward, called the tack; and this being drawn tight down brings the corner of the fall close to the block, which being performed, the tack is laid to be aboard. The buonkin is secured by a strong rope, which confines it downward to the ship's bow, to counteract the strain it bears from the forecastle above dragging it upwards.

BUN, the dry stalk of hemp, stripped of its rind.

BUNCH, a cluster or assemblage of certain things, as of grapes.

Bunch also denotes a tumor, or protuberance, natural or preternatural, either on an animal or a vegetable body.——The bunch growing about the graft of a plant is a sort of callus formed by the extravasated sap. See Camel's. See Camels.

Bunch, in Surgery, denotes an elevation of the back, arising from an exterior location of the vertebrae thereof. The cure is begun by keeping emollients a long time on the vertebrae, whereby to soften the ligaments, and finished by wearing an iron bodice, which compressing the vertebrae, by degrees drive them back to their natural situation.

Bunches in horses, called also knabb, south, and sons, are diseasie arising from foul meat, bruises, hard labour, or the like; whereby the blood becoming putrid and foul, occasions such excrescences.

Bunched boughs, among Frits, are those which stand out and wherein the fex is lodged. See Bull and Root.

BUNCRAHY, a Geography, a small port town of the county of Donegal, Ireland, situated on Lough Swilly, in the peninsula of Inishowen. It is 12 miles N.W. of Londonderry, and 124 N.W. of Dublin.

BUNCUMB, the largest and most western county of North Carolina, and supposed to be the most mountainous in the United States. It lies in Morgan district, and is bounded W. by the state of Tennessee, and S. by that of South Carolina. The Blue ridge passes through this county, and gives rise to many large rivers, as Catawba, Wateree, Bread river, and Pacolet.

BUNDAMIR, a central river of Peria, which passes between Scirius and Inlakar, or the celebrated ruins of Persepolis, and is supposed to be an ancient Araxes, which See. This famous river flows into a salt lake called Baktagan. Between this river and the Kuren, a branch of the mountains of Elwend, extends S. E. See Elwend.

BUNDE, a town of Germany, in the circle of Welfphalia, county of Ravensberg and prefecture of Limberg. At this place a considerable trade is carried on in yarn and coarse linen, and near it is a medieval spring, discovered in 1758.

BUNDEL1, a ridge of mountains in Hindostan, which runs parallel to the Ganges river on the south, but at a considerable distance from it.

BUNDEL, or BUNDLEUND, a territory of Hindostan, lying on the south-west side of the Jumna, and separated from it by a narrow tract of low country. It is inhabited by a tribe of Rajpoets, who are deemed inferior to their brethren of Amurrie. Bundelund is surrounded by the dominions of Oudee, Benares, and the Maharrats, and was formerly subject to a rajah named Hindoooput; but it is now chiefly divided among his sons, or their descendants. It

is a mountainous tract of more than 100 miles square, and contains the celebrated diamond mines of Punna or Purna (probably the Panashe of Ptolemy), together with some strong fortresses, the principal of which is Callinger. It is subject to the depredations of the Maharrats, and has of late years been attacked by Madajee Sindu, who failing to make himself master of the principal fortresses, abandoned the open country. The ancient limits of Bundelund were much more extensive than the present; extending much further towards the Nerbuddah river. Chatterpore is reckoned the capital. Where the soil is not strong, it produces all sorts of fruits, but neither rice nor figs. Cotton trees are abundant, and a species of tree from which is gathered a black nut.

The territories of Adjiring are contiguous to Bundelund, on the west; to the Maharrats, on the south and south-west; and to the Benares territory, on the south. Their whole extent, including some tributary Zemindars on the south-east, may be about equal to Bundelund; and like that, subject to the occasional depredations of the Maharrats. Its capital is Rewaddo or Roobah, which see. Rennell's Mem. Intro.

BUNGERKOLE, a town of Hindostan, in the district of Kullatwur, situated between the two branches that form the Cunnabab river, near the foot of the Imaus or Himalavie mountains. N. lat. 33° 40'. E. long. 74° 58'.

BUNDLE, a collection of things wrapped up and bound together. A bundle of paper consists of 40 quires, a bundle of Hamburgh yarn consists of 20 skeins, and of basket rods, the band is 3 feet.

BUNDLES, in Laws, denote a sort of records of the chancery, lying in the office of the Rolls, in which are contained the files of bills and answers; of bills, co. arms and ciphers; censors; attachments, &c.; feire fac-sims; certificates of statute flaps; extents and liberates; superfecundis; bills on special pardons; bills from the Exchequer of the name of sheriffs; letters patent surrendered; and deeds cancelled; inquisitions; privy-seals for grants; bills signed by the king; warrants of executioners; customers, &c.

BUNDURAL, in Geography, a district of Hindostan, adjoining to the Imaus or Himalavie mountains, in N. lat. about 33° and E. long., about 75° 30'.

BUNEL, Peter, in Biography, an elegant scholar of distinguished eminence, was born at Touloufe in 1499, and educated at Paris. Unable to procure a subsistence at home, he went to Padua, and afterwards to Venice, where he was entertained in the house of Lazarus du Baiff, the French ambassador, and where he studied the Greek and Hebrew languages; of Latin he was before so complete a master, that he wrote it with such purity as to have been deemed the founder of the Ciceroian feet which prevailed so much among the Italian scholars. With George de Selve, bishop of Lavaur, who succeeded du Baiff at Venice, he retired to Lavaur, and upon his death, returned to Touloufe, where he was refused from indigence, and patronized by Meffrs. de Faur. He accompanied the son of one of those in the capacity of tutor on a tour to Italy, and at Turin, was carried off by a fever in his 47th year. His reputation for literary taste and for a philosophical contentment of mind was eminently distinguished. In early life he seems to have incurred the fulmination of hereby, by manifesting an inclination to the opinions of the reformers; but he was rejected by Calvin, because he seemed to have had too favourable sentiments of the Pelagian dogmas. A collection of his Latin letters, written with peculiar purity of style, and containing much curious matter, was printed by Stephens in 1551, and afterwards reprinted at
at Toulouse. The capitols of Toulouse have placed his bust in their town-hall among other ornaments of their city.

Gen. Diet.

BuEeT, Jacop, a painter of history, was born at Blois in 1538, and became the disciple of Frederick Zucchero. He was in high reputation as a painter both at Rome and at Paris; and in the church of the Augustines, in the latter city, he painted a "Defect of the Holy Ghost," which was preferred by that excellent judge, Nicolò Pouffia, to all the paintings in that city. Fikkington.

BUNG, the flopping of a cask, barrel, or the like. The bung is a wooden plug, serving to stop the hole left in the top of a vessel to be filled by. It answers to what, among the ancients, was called plenum, and in the middle ages, fillius, the flesh of a vessel, because in those days it was usually sealed.

After turning new wine, or cyder, the bung is usually left open for some time, that when the liquor comes to work, there may be vent for the froth or foam, and that the hoops may not be in danger of being burst by the violence of the fermentation. Yet, in some cases, they leave wines to ferment, without giving them vent by the bung, in order to render them more brilk and spirituous: in which case, it is necessary the vessel be hooped with iron, and other precautions taken lest the bung may not hold.

BUENGAY, in Geography, a town of Suffolk, England, is built on the banks of the river Waveney, which divides this county from Norfolk, and is navigable for barges from Yarmouth on the coast. This place is memorable for a dreadful fire which, in 1688, consumed nearly the whole of the town, and destroyed property to the amount of £9,890. The town, however, revived after this deplorable event, and its houses, &c. were re-erected in an improved and more convenient style. The town consists of two parishes, and has two handsome churches. That, dedicated to St. Mary, is a large structure, with a lofty steeple. Between the two churches are the ruins of a Benedictine nunnery which was founded in the time of Henry II. Here are also the remains of a very strong castle, which appears to have been built by the Bygods, earls of Norfolk. In the time of the barons' wars, this place was strongly fortified by Hugh Bygod, who is said to have publicly defied the king, but he was obliged to compound with Henry II., by a sum of money, and hostages, to save it from a siege, and demolition by that monarch.

The inhabitants of Bungay have the privilege of a very extensive common in the vicinity of the town. Here are a weekly market on Thursday, and two fairs annually. It is 126 miles N.E. of London, and contains 187 houses, and 903 inhabitants in Trinity parish, and 305 houses, with 1,400 inhabitants, belonging to that of St. Mary.

BUNGO. See Bongo.

Bongo, a province of Africa, in the kingdom of Loango. BUNGURY, a town of Hindostan in Lahore, seated near the river Rauce. N. lat. 32° 20'. E. long. 74° 58'.

BUNGUSH, a district of Cabul, situate to the south of the Cow river and east of the Sindé, terminating on both. N. lat. about 33° and E. long. about 70°.

BUNIALU, a town of AfREDIT Turkey, in the province of Natalia; 28 miles W. of Caftanoni.

Gen. Char. Sal. perianth four-leafed; leaves ovate-oblong, spreading, deciduous. Cor. four-petalled, cruciform; petals obolate; claws attenuated, etc. Stemm. ox, the length of the calyx, two opposite ones a little shorter than the others; anthers erect, bild at the base. Fil. gem oblong; stigma obtuse. Silphii irregular, ovate-oblong, somewhat four-sided, not opening, deciduous.

Eff. Char. Silphii deciduous, four-sided, with unequal acute angles, not opening. Dr. Smith.

Spec. 1. B. cornuta, Linn. (Maliagrum cornutum, Linn. Poriolum cornutum, Gen. Willd. and Vent.) "Specie with two spreading horns, spinius at the base," Linn. Laurea tongue-shaped, very entire, glaucous, without veins, half embracing the stem. Racemes terminal; very loose in a state of maturity, with wide-spread peduncles. Flowers small, not larger than those of Draba verna. Petals narrow, very entire, acuminate, white, a little longer than the calyx. Core somewhat hidip, two-celled. Silphii membranous, lenticularly-compressed, transversely oval; furnished at each extremity with a long, compressed, sword-shaped process, producing the appearance of two wide-spread horns; rafinated on each side with veins; somewhat transparent between the veins, and armed with four pair of small divaricating spines proceeding from the veins. Cells naturally two, placed by the side of each other and separated by a thin partition; but, in the mature fruit, one is constantly obliterated. Seed single, ovate oblong, compressed, inclosed in an aril. Gen. Tab. 142. Fig. 3. Native of the Levant and of the defect of the Calmucks near the Caspian sea.

all the leaves lanceolate." Root annual. Stem near a foot high, somewhat branching, rough with minute prickles. Lower leaves are finely lanceolate, upper ones lanceolate, little toothed; with a few white, forked and thin hairs. Flowers yellow, in racemes. Calyx for calabash ventroso, convex. Silicles oblong, thick, covered with four opposite furrowed angles; and terminated by a pyramidal, obtuse style, the length of the silice. Retz. Obs. 2 p. 21.

Native country unknown. 7. B. orientalis, Lam. (Crasbe orientalis, Tourne. Myag. orient. La March.) Gart. Tab. 147. "Silicles ovate, pubes, warty; lower leaves runcinatae, filiform, upper ones lanceolate?" W. D. Root perennial. Stem branching, upwards of two feet high, branched. Flowers yellow, in long, terminating racemes. Silicle drupace, roundish or obovate oblong, gibbous, warty, ending in a fruit. Rind furrowed, black-coloured. Shell bony, of the shape of the silicle, smooth without; with two cells on the above the other, the upper one, in such silifices are roundish, generally obliterated. Seeds roundish, rufcicent. Miller and Gartner. Gathered by Tournefort in the Levant, and by Gmelin in Siberia. 6. B. coccobradioides, Wild. "Silicles ovate, blunt, somewhat wrinkled; radical leaves oblong, item-leaves arrow-shaped, embracing the stem." Root annual; a native of France, Italy, Hungary, &c. 7. B. tatarica, Willd. (Vella tenuifolia, Dalla 11. tom. 5. P]. 6. French T. floration.) "Silicles globular, somewhat hexagonal, with long beaks; leaves lanceolate, blunt, petiolar." Root annual. Stem erect, branching, half a foot high. Leaves very entire, hifpid, attenuated into a petiole at the base. Flowers white, in fiform racemes. Silicle four-furrowed, crowned with the thick, cylindrical, permanent style, two-celled, not opening. 8. B. Myagroides, Link. Nat. 36. (Cakile myagroides, Vent.) La March Illurt. Tab. 534. fig. 1. "Silicles two-edged, two-jointed, a little swelling above; leaves pinnate, with reflected nerves." Root annual. Stem straight, two feet high, even, irregularly branched. Lower leaves pinnate or bipinnate, rather broad, not flufhy, deep green, with oblong, toothed divisions or pinnas; the upper ones very similar, but narrow and linear; all with reflected nerves. Racemes terminal, long, ftraight. Flowers nearly fuffila. Cakile oblong, cd; Peduncles very ealr, pale, purple. Authors yellow. Style fword-shaped. Silicle sub-cylindrical, rigid, approximating to the rachis; on a short peduncle; lower joint cylindrical, two-valved, generally with only one seed, the valves marked with a fingle treafk; upper joint, compressed, obtusely two-edged, generally with only one seed, blunt, with a protruberant auricle on each side. Linn. A native of Siberia. 9. B. pygmaea, Linn. Sy-db. Nat. tom. 3. p. 231. (Myagrum verrucosum, Lab March) Gart. Tab. 142. copied by La March in Illurt. Pl. 534. fig. 3. "Silicles four-angled, rugged with warts on all sides; leaves runcinate." Root annual. Stem a foot high, branched, hifpid below, fmoother above. Leaves runcinate, somewhat toothed, even; with a few hairs beneath on the petiolis. Racemes solitary, terminal, long. Flowers pedicelled. Clafyx yellow, spreading. Pedals dark yellow, ob ovate, obtufe, spreading, with erect claws. Stamens yellow, dilat. Germ. ovate, four angled, green. Style none: stigma capitate, yellow. Silicle drupaceous, small, oval, four angled; the two narrower sides rugged with warts; the two broader marked with a double, longitudinal, elevated freak, which is crenulate, or lightly tubercled: rind very thin, membranaceous: shell bony, mucrate, two celled; cells placed by side. Seeds follar, ovate, convex on one side, flat on the other, rufcicent. Linn. and Gart. A native of Egypt. 10. B. balentica. Linn. Nat. 429 (Myagrum bol. Lab March) Jacq. hort. Tab. 144. Gowan illurt. tab. 20. "Silicles hilipid; leaves pinnate; foliolas somewhat toothed." Root annual. Stem a foot high, much branching, spreading, angular, smooth. Leaves petioled; pinna lanceolate, sinuate, obtuse, smooth. Peduncules in racemes, very long, erect; pedicels shorter than the flowers. Calyx closed, smooth, lanceolate, concave, tiliaceous. Corolla yellow; petals oblong, obtuse, the length of the calyx. Silicles globular, elongated on every side to oblong, flat, Franck, longer than the silicle. A native of Majorca and Minorca. 11. B. profusa. Wild. Pest. Atl. tab. 170. "Silicles one-feeded, toothed; leaves pinnati- fed; segments subulate." Stems numerous, profusely, pubescent from the root. Leaves pubescent, deeply pinnatifid; segments obtuse, toothed. Flowers white. Silicles roundish, compressed, terminated by the permanent style, pubescent. A native of the sandy soil in the northern part of Africa. 12. B. Cakile Linn. Hufion. Withering, Smith. (Cakile maritima Tourn. La March, Vent. Wild. Cakile Scapitifions Lorb. Gart.) Eng. Bot. Pl. 321. La March illurt. Pl. 534. fig. 2. Gart. Tab. 147. "Silicles ovate, two-edged, smooth, one-seeded; leaves flufhy." Smith. Root annual, slender, woody, running deep into the ground. Stem round, much branched, woody, divided from the base into widely dilated, zig-zag, twisted branches. Leaves alternate, thick and fucculent, rather glaucous, smooth, more or less deeply pinnatifid and toothed; their segments all obtuse. Flowers pale purple in dense, terminal corymb, which afterwards grow out into spikes. Calyx gibbous at the base. Silicle smooth, oblong, acuminate, obsolete, four-angled, but so compressed as to make two opposite edges very prominent, two jointed, separating at the joints: the upper joint largest, deeply emarginate at the base, spongy, distinctly fertile, one celled, not opening spontaneously, but easily separated into two valves at the prominent angles: the lower joint smaller, somewhat top-shaped, sometimes perfectly solid, and sometimes furnished with a cell, which is either barren or contains a single flegel; but a hotter lower joint is very rare, and never occurred to the observation of Gartner. Miller, Gart, and Smith. An inhabitant of the sea-coasts of Europe, Asia, Africa, and America. Willdenow describes the variety B. Vahl, which he conjectures to be Iphis Egyptianus of Linnaeus, as a second species of his genus Cakile, under the trivial name of Egyptianus. It differs chiefly in having larger leaves, longer peduncles, and more flowers in each involucre; but it seems to be only a variety of the common species.

Onf. This genus, like several others of the same natural family, is very perplexed and obscure, and differently treated by different authors. Linnaeus, at first, formed it of such species as bore rough or mucrinated fleshes or flices, including the Erucago of Tournefort, and framed its generic character accordingly: but afterwards, without changing the character, admitted the Cakile of Tournefort, which has not rough or mucrinated fleshes, and which in his Hornus Cliftonianus and Flora Suecica, he had placed under Raphanus. La March has abolished it entirely, keeping Cakile distinct, and placing the other species under Myagrum, which, he says, forms with them a very natural genus, consisting of species with fleshes, in some respects so different from each other, that, if not united under one very general character, they must conllude nearly as many genera as species. Jussieu, instead of uniting it with Myagrum, is rather inclined to divide it into three, Bunias, Erucago, Cakile. Gartner makes its essential character depend on a drupaceous silicle, adding that those who are delighted with
with a multitude of genera, may divide it according to the
internal structure of the drupe, and the seeds into Bunias,
Lactia, and Aruciago. In conformity of this established
principle, he has not only reared the genus Carake de
Tournefort, but has also introduced a new one for the
Bunias corumata of Linnæus, under the generic name Potio-
nium, from пожа a dagger, suggested by the shape of the sin-
ular processes from the bicle. Willdenow and Ventenat
have admitted the three genera, and the latter has also
given names to a distinct genus. In this diversity of
opinion, we have thought it but to keep the Linnaean gen-
us entire, only adopting the essential character given by Dr.
Smith in his Flora Britannica, which appears to be equally
comprehensive of the proper species and exclusive of oth-

Bunias Syriaca, of Gartner and Willdenow. See
Anastatica Syriaca. La March says that it is not the fruit
of Myra gramm, and consequently cannot belong to the
genus Anastatica. Gartner, when his plates were engraved,
followed the arrangement of Linnæus, but, when he wrote
the descriptions, had discovered that the Linnæus is a
druepe, though the rind is so thin as to be scarcely discern-
able, and that, therefore, it belongs to the genus Bunias.

Bunias, Gerard. - See Brassica Napus.

Bunium, (supposed, like Bunias, to be derived from
βανος, a hill, as is laid, from its affecting high situa-
tions, but that being neither its peculiar nor universal character,
it is probably so called from the form of its root) Earth-
nut. Kuper-nut, Pig-nut, or Hawk-nut. Linn. gen. 255.
30. Gart. 807. Bulboceenam Tourn. Chas and order,
petantrum diggiua. Nat. Ord. Umbel. Linn. Umbel-
liffere Juif.

Gen. char. Umbel universalis, with many drus not
twenty: partial, very short, crowded. Involute uni-
versal short, of many linear leaves, sometimes not more than
three, or one only, and after the flowers are opened, often
entirely wanting: partial locossse, the length of the par-
tial umbel. Perianth proper scarce apparent. Cordal uni-
versal uniform. Florets all fertile. Cor. proper of five
flex-cordate, equal petals. Stem. filaments five, shorter
than the corolla, simple; anthers simple. Fil. germ ob-
long, inferior: styles two, reflexed; stigmas obtuse. Peric.
none: Fruit ovate, splitting in two. Seeds two,
ovate, convex on one side, flat on the other. Linn. five
fringed, the spaces between the fronds finely wrinkled.

Essen. Char. Cor. Uniform. Umbel crowded. Fruit
ovate.

Sp. 1. B. Bulboceenam. Linn. (B. minus. Gouan.) La
March, Ill. 157. "Involute many-leaved: lea emit and
leafy at the base." Dr. Smith. "Leaves unifolium, involucro
many-leaved." Willd. "Fruit somewhat cylindrical, thicker
at the apex; styles reflexed, deciduous." Gouan. Root
perennial, tuberos roundish. Stem round, alternately branched,
leafy, fringed, smooth. Leaves trinlicate: segments linear, of ten trifid. Umbels terminal, erect.
Partial umbels close, white. Involute three times shorter
than the rays. Dr. Smith. Common on the Continent; rare in England; found by Martyn in the time of
Dillenius, near Hornfey wood, and by Mr. William Wood,
lately in Kennington gardens. 2. B. flexuosum, Stokes in
Withering and Dr. Smith. (B. majus. Gouan and Will-
denow.) "Involute of three leaves or less; leaf naked,
tapering, and zig-zag at the base." Dr. Smith. "Stem
leaves very narrow, involucre none." Willd. "Fruit
ovate, acuminate; styles permanent." Gouan. Root tu-
berous, roundish. Stem elongated under the earth, tapering,
zig-zag, white; at a foot and a half high, crept,
branchied, leafy, fringed, smooth. Radial leaves on long
petiolo, trinicate: segments linear, pliniatifid and gilled;
stem leaves nearly fertile, trinicate, finely divided; sheath
short, grooved, smooth, the edge membranous and whitish.
Umbels several; universal rays from seven to twelve, partial
about twelve. Involute unifolium and partial various; in
Yorkshire specimens, the universal involucro mixed commonly
of one or two lanceolate leaves, with three coloured ribs,
proceeding from a projecting ring which surrounds the
base of the umbel; partial one of from one to three leaves,
exactly resembling those of the universal involucro and proceeding
from a similar ring. Styles white according to Curtis, but
in our specimens they are purple, with globular filament.
A native of heaths, dry pastures, and woods, in almost every
part of England. Linnæus confounded these two species,
but, as Dr. Smith observes, appears to have drawn his de-
scription from the Bulboceenam, the majus of old authors.
They knew only one species, which mull have been the
flexuosum; but Magni, his contemporary, mentions both
in his index of plants growing about Montpelier, and adds
that he found them to be specifically different by cultivating
them in his garden. Johnfon, in his edition of Gerard,
distinguifled them, and Dillenius was rather inclined to
think them distinct; though Professor John Martyn, on
whose authority he admitted the majus of the old botanists
as a British plant, suspected that the difference was owing
to the roots growing nearer than usual to the surface of the
ground. Gouan, who cultivated them during eight years,
is surprized that they have not been distinguished long
since, and gives specific differences which, however, do not
satisfy the present professor Thomas Martyn. But Dr.
Stokes and Dr. Smith have, we apprehend, now deter-
mined the question. The tuberous roots of both species,
on account of their sweetish taste, have long been a favour-
ite esculent with boys, and when boiled or roasted are
said to be little inferior to chestnuts. Ray recommends them
when seasoned with pepper as a nourishing, stimulative,
food, and the old empirics attributed medical virtues to
them, which have long since been exploded. Gouan and
Willdenow have perversely given the specific name majus
to the minus of the old authors. 3. B. aromaticum. Linn. Mant.
218, "partial involucres of three leaves." Root annual,
and as Bofe observes, probably not tuberos. Stem erect,
even, alternately branched. Leaves resembling those
of Carum Carvi, super-decompound. Umbel of ten or twelve
rays on a long, fringed peduncle. Partial umbels short.
Involute involucro of about six, short, awl-shaped leaves.
Partial involucres of about three leaves, the length of the
little umbel. Corolla white. Petals equal, infl ex-cordate.
Seeds ovate, minute, yielding an aromatic odour, similar to
Carum. A native of Crete and Syria.

Bunium, Sauage, Mont. See Sison verticillatum.
Bunium, Dalech. J. Bauh. See Æthusa Bunius.
Bunium, Rump. and Barm. See Stilago Bunius,
now discovered to be the male of Antidium alexandria.
Bunker's Hill, in Geography. See Breed's Hill.
Bunkle's Manuscript, in Biblical History, a mo-
dern MS. of the four Gospels, noted in Mill Bu., and 70 in
the first part of Welthein's New Testament. When this
MS. was collated by Mill, it was the property of Mr.
Bunkle of London; but at present it is preserved in the
University library of Cambridge. Whether it was written
a short time before or a short time after the invention of
printing, which last is ascertained by Welthein, in opposition to
Mill, is a matter of little importance. It is supposed to have
have been written by George of Sparta, who was sent on an
embassy to England by Pope Sixtus IV. in 1476. It has
not the ancient antites, but the modern chapters, which
are found in our printed bibles. Michaelis’s Int. to the
New Testament by Marth, 2nd vol. and iii.

BUNASS, in Geography, a river of Hindostan, which
runs to the Isfin; 25 miles N. E. of Oudhpour.

BUNICK, JOHN VAN, in Biography, a painter of his-
tory and portrait, was born at Utrecht in 1654, and under
the instruction of Herman Sechler he became a consider-
able artist. Having in some time associated with Gerard
Hoeck in the exercise of his art, he determined to improve
himself at Rome; and there became acquainted with Carlo
Maratti, and Abraham Gedoos, from whose works and
conversation he derived great benefit. Intending to return
home, he was detained by the duke of Modena, who en-
aged his service by the grant of an honourable pension,
and retained him in his court for eight years. He designed
well, disposed his figures with elegance and propriety, and
was correct in his outline. He died in 1727.

His brother and disciple, Jacob Van Bunnik, became
an excellent master, and distinguished himself by painting
battles. His subjects were different from those of his
brother, but in the manner of his handling and colouring, he
resembled him entirely. He died in 1725. Pilkington.

BUNNOO, or BANO, in Geography, a town of Cabul,
situate between the mountains of Sindia Bafich, which lie
south of Pindawur and the river Cophenes, or Cow river,
or the great river of Bunguhi, which is formed by the
waters of Ghzini and Gurdaiu, and passing by Nughz
and Bunnoo, discharges itself into the Indus or Sind, at Dein-
kote. N. lat. 33°. E. long. 70° 20'.

BUNNUEL, a town of Spain in Navarre, seated on the
Ebro; 7 leagues from Tudela.

BUNOLA, a small town in the island of Majorca.

BUNOWEN, a village on the coast of Comanera, in the
western part of the county of Galway, Ireland, which gives
name to a bay, in which small vessels may ride in the sum-
ner time, or in moderate weather, the ground holding well,
and the water from 2 to 2½ fathoms. N. lat. 53° 24'. W.
long. 10° 58'.

BUNRATTY, a barony in the county of Clare, Ireland,
which derives its name from the old castle of Bunnratty, or
Bunratty, which was built near the mouth of the small river
Garna, that flows into the Shannon, and was considered a
fortress of great strength and importance. It was built by
Thomas de Clare in 1277 for the protection of the English
settlers; and was afterwards the occasional residence of the
ears of Thomond. Being taken possession of by the adhe-
ents of the parliament in 1653, it was besieged by the Irish
underlord Muskerry, and held out six weeks. It is about
8 miles west from Limerick. Hollandhead.

BUN of a sail, in Sea Language, is the middle part of it,
formed into a kind of bag, or pouch, that it may catch and
receive the more wind.

The bunt is chiefly used in topsails, the foremost leech of
which is cut with a neck; for courses are for the most part
cut square, or at least with a small allowance for bunt or
compas, which is the middle part of the foot of such sails.
They say, the bunt holds much leeward wind; that is, it hangs
too much to leeward.

Seamen all agree, that a bellying or bunting sail carries a
veesel faster to the windward than a straight or flat sail: the
contrary of which is afforded by Dr. Hooke, who has a dis-
course to thrive the preference of straight to bunting sails. Vide
Hooke’s Polibyn. Works, p. 563, seq.

BUNI-lines, are small lines made fast to the bottom of the
square sails, in the middle part of the bolt-ropes to a cren-
gle; and so are received through a small block, seated to
the yard: their use is to trive up the bunt of the sail, for the
better furling it up.

BUNI-lineavor, is the lining fewed up the sail, in the
direction of the bunt-line, to prevent the sails being chafed.

BUNTIN, a thin woolen stuff, of which the colours
and signals of a ship are usuallly made.

BUNTING, in Ornithology, the English name of the
birds of the Emberiza genus. See Emberiza.—Bunting
is the name applied in common to Emberiza Miliaria.

BUNTINGFORD, in Geography, a small market-town
in the county of Hertford, England. It stands on the
banks of the river Rib, near the spot where the Roman road
called Enning street, crossed it. Edward the third, in the
21st year of his reign, granted to this town, the privilege of
a yearly market, and a fair. In the 41st year of his reign
he further endowed it with a weekly market on Saturdays,
and a fair in June. This town is only a chapelry to Lay-
ton, where the church is situated, but the inhabitants are
accommodated with a rectory and commodious chapel, which
was finished in 1626. Here are a free-school, an alms house,
and other charities. The present market day is Monday;
but the markets are very considerable. Buntingford is 31
miles north from London, and with the remainder of the
parish, contains 163 houses, and 799 inhabitants. Magna
Britannia, vol. ii. 973.

BUNTSPECHT, in Ornithology; Frisch has the greater
woodpecker, picus major, under this name.—Kleiner Bun-
tspecht is the lesser spotted woodpecker, picus minor, in the
same author.

BUNZLAU, or BUNZEL, in Latin Bolestavia, in Geo-
ography, a town of Sileia, in a circle of the same name, and
in the principality of Jauer. It is feated in a fertile coun-
try, on the Böber; and exports great quantities of its beau-
tiful brown earthen ware. It was formerly noted for the
rich mines in its vicinity, and the Sileian bards have cele-
brated the limpid and fabulous waters of the quick-brum
or quick-spren that lies near it. N. lat. 51° 12'. E. long.
15° 50'.

BUNZLAU, Alt, an ancient town of Bohemia, in the cir-
cle of Boleswau, founded by Wartislaus in 915, but reduced
by the troubles of the 15th and 16th centuries to an incon-
derable place. It is feated on the Elbe, 8 miles S.S.W.
of Benatek or Benatky.

BUNZLAU, Jung, a town of Bohemia, and capital of
the circle of Boleswau, built in 973 by Bolewau the younger,
and ranked in 1600 among the royal boroughts by the
emperor Rudolph. It is feated on the Icer, 28 miles N.N.E.
of Prague.

BUNYAN, JOHN, in Biography, a very popular writer
among persons of a particular description, sprung from an
obscure origin, being the son of a tinker, and was born at
Elllow near Bedford, in 1628. His parents gave him an
education suitable to their condition, and taught him to read
and write; but his conversation and conduct in early life
were remarkably vicious and profane, though not without
some checks, which indicated very strong religious impre-
sions. In process of time these impressions, revived and
cherished by the conversation of some pious women, with
whom he accidentally associated, terminated in a thorough
reformation, so that he became as much distinguished for his
piety as he had once been for his profligacy. For several
years he followed his father’s occupation, and in the exer-
cise of it travelled about the country, particularly in the
neighbourhood of Bedford. He enlisted as a soldier in the
parliament army, and at the siege of Leicester in 1645, his
life
life was singularly preferred by his conjointing to give up his place as a sentinel to a comrade, whose head was taken off by a musket ball. At the time of his marriage, his poverty was such, that neither he nor his wife possession so much as a duff or a spoon; but he had, what he deemed of greater value, the Plain Man's Path-way to Heaven, and The Practice of Piety, which he was accustomed to read with her, and which afforded him singular satisfaction and advantage. Of the sincerity of his conversion he exhibited such evidence, that he was admitted in 1675, a member of a Baptist congregation at Bedford; and he was so regular an attendant on meetings held for religious purposes, that, soon after the reformation, he was convicted of associating with others in unlawful assemblies and conventicles, sentenced to perpetual banishment, but afterwards committed to prison, where he supported himself and family, during a confinement of twelve years and a half, by making tugged lace, and where he employed part of his time in preaching to and praying with his fellow-prisoners. His library at this time consisted only of the Bible, and the Book of Martyrs; and yet he compos'd many of his works, and, particularly, his Pilgrim's Progress, whilst he remained in prison. In the last year of his confinement, such was the estimation in which his talents and character were held, that he was unanimously chosen pastor of the congregation at Bedford. After his enlargement, for which he was indebted to the compassionate interference of Dr. Barlow, bishop of Lincoln, he travelled into several parts of England, for the purpose of visiting and confirming persons of the same profession; whence he obtained the appellation of Bishop Bunyan. Upon the publication of king James II.'s declaration for liberty of conscience, Bunyan was enabled, by the voluntary contributions of his friends, to build a meeting-house at Bedford, where he constantly preached to very large congregations. He also frequently visited London, and preached there among the non-conformists; but in one of these visits he was seized with a fever, and died at his lodgings on Snow-hill, August the 31st, 1689, aged 60. His remains were interred in the burying ground belonging to the dissenters in Bunhill Fields. His religious sentiments were those of the most rigid Calvinists, to which he was zealously attached; his piety, though blended with some degree of enthusiasm, was sincere and uniform; and his moral conduct, after the period of his conversion, was not only irreproachable, but exemplary, though his zeal exposed both his principles and character to many unfounded reproaches and calumnies. As he never enjoyed the advantages of a liberal education, his public performances, as a preacher and his writings, as an author, indicate very extraordinary talents. In his preaching, he spoke with considerate fluency, though not without some hesitation; and his ministerial labours were countenanced by the learned Dr. John Owen, who occasionally attended his sermons. Of his numerous works the most celebrated, both for its composition and popularity, is his Pilgrim's Progress. This work, which has passed through more than fifty editions, and which has been translated into various languages, has been admired and applauded by some of the best judges; and there are few persons who have not read it, whatever may be their opinion of the theological system on which it is founded, and of the terrific ideas which it is adapted to excite in the minds of the young. The allegory is well conducted and fulfilled; the characters that are introduced are justly drawn; it abounds with lively description, and manifests the exuberance of invention. Lord Kainins, speaking in his Sketches of the History of Man, (vol. i.) of this work, and Robinion Crusoe, the great favourites of the vulgar, says, that "they are composed in a style enlivened, like that of Homer, by a proper mixture of the dramatic and narrative;" and Bunyan's genius, displayed in this performance, has been, perhaps, extravagantly extolled by other writers, among whom we may reckon Mr. Granger, Mr. Merrick, and Dr. Roberts, to whose sentiments great deference is due. Many of Mr. Bunyan's other works are of the allegorical or parabolical kind; and though not equally popular with the Pilgrim's Progress, are much read by a certain class of persons. The most considerable of these is the Holy War, made by Shadwell upon Diabolus. One of the most interesting of his works is Grace abounding to the chief of Sinners, containing an account of his own life. All his works were collected together in 2 vols. folio, London, 1756, 1757; and a new edition, more complete than any of the preceding, with copper-plates, and a recommendatory preface, by Mr. George Whitfield, was published in 2 vols. folio, in 1767. Buon, Buo.

BUOMATTEI, Benedict, an early Italian grammarian, was born at Florence in 1581, and having entered into the priesthood, discharged the duties of his function, and pursued literary studies at Rome and Padua, and chiefly in his native city. He was a member of several academies, and particularly that of those of Della Crusca and the Apostoli, where he recited lectures and discourses, many of which have been published. But he is principally known by his two books On the Tuscan Language, being the first work that devotes the title of a grammar of the Italian language, and still popular and highly esteemed. Buonmattei died at Florence in 1624. Tiraboschi, Gen. Bio.

BUON, in Geography, a town of the kingdom of Naples, and Principato Ultra, and ruled E.N.E. of Benevento.

BUONACCORDO, a small flaring musical instrument, resembling a fipple, used by children to learn to play on, because of the shortness of their fingers.

The word is Italian, and properly denotes a haphazard.

BUONACCORSI, Philip, in Biography, an elegant modern Latin writer, was born of a noble family at S. Gimignano, in Tuscany, in 1417; and residing at Rome in his youth, he was one of the founders of the Roman academy, according to the custom of which he assumed the name of Callimaco, adding to it Esperiente, in allusion to the vicissitudes of his life. Being suspected by pope Paul II. of a concern in a conspiracy against his life, he was under a necessity of fleeing himself by flight; and having wandered through Greece, Egypt, Cyprus, Rhodes, and other islands in the Archipelago, Thrace, and Macedonia, he at length took refuge in Poland; where he was introduced to king Louis, who made him tutor to his son Albert, and his own companion. After the death of Callimaco, he was entrusted by Albert, his successor, with the conduct of all the affairs of his court and kingdom; and though these marks of distinction excited the envy of Albert's courtiers, and many attempts were made to ruin him, he retained his sovereign's favour till his death, which happened at Cracow, in 1504. Callimaco, for which the name by which he is distinguished, Calliser, wrote in 3 books the life of Ladislaus, brother and predecessor of Callimaco, with an account of the battle of Varna, in which he was killed. He also composed a life of Attila, and a small treatise on the attempts of the Venetians to excite the Tartars and Persians against the Turks. These pieces, with some orations and letters, have been published together, and passed through several editions. The style in which they are written is elegant and forcible; and in the opinion of Paul Gioio,
Giovio, no historian since Tacitus has equaled Buonamico. Many unpublished works are preferred in the Vatican, and other libraries. Tiraboschi, Gen. Biog.

Buonamico was born at Lucca in 1710, and having entered into the ecclesiastical state, sought advancement at Rome; but being disappointed in his views, he afforded a military character, and engaged in the service of the kings of the two Sicilies. He still, however, indulged his taste for the pursuits of literature. His principal works are a relation in Latin of the war of Velletri in 1745, between the Austrian and Neapolitans, printed in 1748, under the title of " De Rebus sub Ultime Magno Commentarium," 4to.; for which work he was recomposed with a pension by the king of Naples, and the rank of commissary-general of Artillery; and "De Bello Italico Commentarius," 4to. in 3 books, 1750, 1751: containing the history of the war in Italy, for which he was honored by the duke of Parma with the title of count. These histories, equally admired for accuracy of detail, and purity of Latin, have been several times reprinted. The author's treatise "De Scientia Militari," remains unpublished. He died at Lucca, in 1761. Nov. Diet. Hill.

Buonamici, Lazzaro, was born at Baffano in 1479, and educated in the university of Padua, where he gained such reputation, that Pomponazzi, his tutor in philosophy, sometimes applied to him for the explanation of a passage in Aristotle. From Bologna, where he was employed in the instruction of the young persons of the Campiggi family, he removed to Rome, and became professor of the belles lettres in the college of Sapienza. In 1527, when the city was taken, he lost his library, writings, and all his effects, and with difficulty saved his life. At Padua he occupied the chair of Greek and Latin eloquence, to which he was invited in 1530, and in this situation, where he was highly respected, and where he had a great concourse of students, he remained, notwithstanding several applications made for removing him by universities and sovereign princes, till his death, which happened in 1552. He was borne to his grave on the shoulders of his students. His writings, consisting of letters, panegyrics, and Latin poems, are few, but they are sufficient to establish his character as an elegant writer. Notwithstanding his professional reputation, he disdained much of his time in the intercourses of society and in play, to which he was so much addicted, that he sometimes devoted whole nights to it. His dread of criticism might also prevent his appearing before the public as an author. A collection of his poems was printed for the first time at Venice in 1572. Tiraboschi, Gen. Biog.

Buonamico, of Cristofano, called Buffalacce, was a Florentine painter, born in the year 1562, and a pupil of Andrea Tafi. He was an artist of great merit, and by Procaccio celebrated for his wit and humour (vid. II Decamerone); and Francesco Sacchetti in his " Tre Cento Novelle," relates a story of him when he was a boy, which shews the early bias of his mind; and as it pourtrays the character of the man, it may not be without its interest. Andrea Tafi was a painter of great industry, and used to rise before it was light to pursue his avocation, considering the gain more than the honour of his profession. Early rising, unfortunately, had no charms for his scholar, and therefore he devised a scheme to make him lie in bed till daylight. At the hour Tafi was about to rise, having previously provided himself with thirty black beetles, and on their backs fastened small pieces of wax taper, he lit them up, and sent them one by one, through a hole in the door, into his master's bed-room; making a procession of moving light mysteriously unintelli-
gible; which so alarmed the old man, that he prayed and recommended his soul to mercy, and hid his face under the bed clothes. In the morning he told Buonamico he had seen ten thousand devils, and that his thoughts were so disturbed he could not rise to pursue his profession. On the succeeding night, Buonamico diminished the number of the beetles; but the repetition produced the same effect, and so frightened his master, that he determined to remove, being persuaded the house was haunted by evil spirits. Buonamico then sent to the parish priest that he might administer comfort. The priest came, and foud his mind; and Buonamico availed himself of the opportunity to make his observations on the probable cause of this perplexing event. He observed that he had always heard devils were great enemies to God; and consequently they must be so to all painters, as their practice was to paint saints and angels as perfect as possible, and endeavour to improve mankind, by shewing through all the circumstances of human life the happiness of heaven and the torments of hell; besides, whenever feuds were represented, they were made as hideous as the painters' imagination could suggest: and it was well known that devils had more power by night than by day, they played him this trick to keep him in bed, that he might not interfere with their region of darknes; by such obervations, which the priest thought very plausible, the old man was persuaded that it would be proper to lie in bed till daylight. After a few months, however, as the devils grew fainter in his recollection, Tafi's industry returned; but as they had played their part so well, Buonamico returned to his former expedient, which produced an effect not less frightful and imprudent. Priests were again sent for to restore him to tranquillity, who agreeing with Buonamico in the probable cause of this strange appearance, he determined to paint no more by candle-light, and this story was so generally circulated and believed, that all the painters in Florence were afterwards afraid to paint at night.

Among the first works of Buffalacce, were a series of religious pictures representing the life of Christ, painted in a church at Faenza, and other subjects from the Old and New Testament; among which the massacre of the Innocents is particularly mentioned by Vafari, where despair and terror, agony and distress were forcibly expressed. Of this work nothing now remains, except the original drawings in existence, which the same author describes to have been preferred in his time. He also painted in the cloisters of the abbey of Septimus, several historical subjects relating to St. James, to whom the church was dedicated; and on the ceiling he painted the four evangelists. He painted also many historical pictures on the outside of this building, which were well composed, and executed with skill. In these pictures he employed falt in the purple used for the shade tint of the fields, which so corroded and destroyed all the other colours, that, in Vafari's time, nothing remained but the purple; which premature decay this author at first attributed to dampness, but, upon minute inspection, found it was owing to the salt that was employed.

For the monastery of the Carthusians at Florence he painted upon panel two pictures in dipteram; and for the church of San Giovanni Decamerone, which were destroyed when the walls were beaten down in the war of 1526. He executed other works at Cortona and Perugia, Arezzo, and painted several pictures in the church of St. Petroono in Bologna.

In the cathedral of Siena is a Mosche pavement, made from his drawings; which at this day is a specimen of his abilities in design and composition, very honourable to his reputation. Some of his latest works were executed at Pisa, for
BUOYS

for the abbey church of St. Paul, taken from the Old and New Testament; and in one of these, representing Noah's ark, he introduced his own portrait, which is the only portrait known of him, and is the same Vafarí introduced into the second edition of his "Lives of the Painters."

Baffalmaaco enjoyed considerable reputation, nor was the age wanting in admiring the opportunity to excel his talents; yet, from the following anecdote, he appears occasionally to have worked at a very low price. Vafarí has recorded, that he painted a whole length figure of St. Christophor, 12 braccia in height, nearly 23 feet, for 8 florins; and this fact is preserved for the sake of a whimsical circumstance that attended the execution of it. The picture was ordered by a convent, and was to occupy a wall in a church at Florence; when Baffalmaaco went to paint, he found the wall only 10 braccia in height; that his employer, therefore, might have no prejudice, he painted St. Christophor lying upon his back; but unfortunately even in this position, the wall did not admit of his whole length; he then turned up the legs perpendicular to the body, which was so exceedingly ridiculous, that when the countryman came to see his work, he flew into a violent passion, and demanded his money, declaring that he was both cheated and insulted, but the painter intimated that he had executed the commission with the strictest fidelity, and therefore could neither agree with him, nor comply with his requit; upon which the countryman brought an action against him, and in the result was not more successful.

This propensity to make merry with life, made Baffalmaaco regardless of the means by which its decline is supported; and at the advanced age of 78 years he died in extreme poverty and diftresses, supported in his last illnesses by the charity of an hospital, and buried by the company of the Misericordia. Vafarí has written his life in 13 quarto pages, containing little more than general commendation and whimsical anecdotes connected with the exercise of his profession.

BUONAROTI. See Angelio.

BUON-CONVENTO, in Geography. See Bon convento.

BUONHABITACULO, a town of Naples; 8 miles N. of Policastro.

BUONTALENTI, Bernardo, called Girandole, in Biography, a painter of history and portrait in miniature, acquired correctness of design, and the knowledge of colouring, from Salviati, Bronzino, and Vafarí, and the art of miniature-painting from Giulio Clovio. His works were much admired for the beauty of the colouring, and for a certain dignity of expression in his Madonnas, as well as in his portraits. Besides his merit as a painter, he was much approved as a flautist and an architect. He was born at Florence in 1547, and died in 1628. Dikington.

BUONVICINO, in Geography, a town of Naples, in the province of Calabria Citra; 11 miles S. E. of Scalea.

BUOY, a small island on the east coast of Newfoundland, between Ferryland head and harbour. See Boyle.

Buoy, in Sea Language, a body floating in water, to show either the situation of a ship's anchor, or a danger, as founds, shoals, &c. that it may be avoided. Buoys are of various forms, and constructed of buoyst materials, as wood, cork, &c. The names of the principal kinds of buoys are can, cable, or cable, mm, and wooden buoys.

A can-buoy is made in form of a cone. This kind is particularly employed in pointing out the extremities or sides of any dangerous bank, sand, &c. A buoy for this purpose is, therefore, large, that it may be seen at some considerable distance, and is fastened to an anchor, sunk in a proper situation, to point out the danger. When there are several buoys on the same bank or shoal, they are generally painted of different colours, to prevent mistake, as black, white, and red; this last colour is that which is best perceived, for a white buoy is not easily observed in broken water, and in many cases a black painted buoy is very indistinct. In going through a narrow channel, in place of having buoys on one side only, there are sometimes buoys on one side and beacons on the other; but as these last are more easily broken down by the violence of the waves, buoys may, therefore, be placed on each side; and to prevent mistake, those on the one side should be can-buys, and cable-buys on the other side.

For this purpose it has been proposed, in going in to all ports, to have can-buoys on the larboard hand, and cable-buoys placed on the babord hand; which varieties, experience has shown, may be perceived at a considerable distance. For the can-buoy, in consequence of its broad head, forms a cliff on its side; while the cable-buoy, being much narrower and lighter at its upper end, turns more upright, and higher out of the water.

Cable-buys are any common buoys used for buoys. When cables are employed to float, or buoy up the cable in different places to prevent it from being injured by rocks, &c. at the bottom, they are called cable-buys.

Non-buys are in form of the middle frustum of two cones, abutting upon a common base, being buoys, which are large in the middle, and tapering greatly towards each end.

Wooden-buys are solid pieces of timber, being in form either of a cylinder, or non-buoy. They are furnished with one or two holes, in which to fix a short piece of rope, whose two ends being spliced together, make a sort of circle or ring called a Harm. These several buoys are represented in the Plates of ships.

Buoy rope, the rope that connects the buoy with the anchor. The length of this rope should be very little more than equal to the depth of the water where the anchor is to lie, that the buoy may thereby float, as nearly as possible, immediately above the anchor, and consequently point out its situation. The buoy rope is useful in weighing the anchor, either by means of a boat, or when the cable is broke or run out; and, therefore, it should always be of sufficient strength for this purpose, otherwise the anchor may be lost. See Plate of ships.

Buoy, Sling of the, the ropes which are fastened about it, and by which it is hung. They are curiously spliced round the buoy, somewhat resembling the braces of a drum.

Buoy, to steer, is to let it fall from the ship's side into the water. This is always done before the anchor is let go, that it may not be retarded by the buoy rope, in its descent to the bottom.

Buoy of the Nose is situated about N. E. from Sheerness fort, on the N. W. point of the isle of Sheppey, the exit entrance into Chatham river, or the Medway; and it is at the extreme point of a sand, which runs E. N. E. from the isle of Grain, or west entrance of the Medway.

BUOYANT, denotes a thing floating, or apt to float.

BUPELUS, in Biography, a celebrated sculptor, descended from a line of ancestors of the same profession, was a native of Chios, and flourished in the 6th Olympiad, or 540 years B. C. His brother Abinias was also of the same profession. They worked only in the white marble of the isle of Paros, and executed several statues at Rome. They were contemporaries with Hippomenes, a poet of a deformed and contemptible figure, whom, for their diversion, they
they represented under a ridiculous form. The poet rendered himself by writing against them a parable, which, as from fays, caused to hang themselves. But Piny, fays, with the contrary, that after Hippomax had taken his revenge, they made several very fine statuettes, and particularly one of Diana at Chios, which was placed at a great height, and afforded a pleasing countenance to those who entered, and a pleasant one to those that departed. Faful, in the c.e. 35, p. 355, and d. g. c. 35, p. 371, i. 9 (Linnii) contained Euph. as a great architect as well as sculptor.

BUPARIA, in Etymology, a species of Pisiiia of the wonged kind; black, and glabrous; thorax lunated; jaws brown toothed, and as long as the head. Gen. Off. This is described by Forster under the name of Tereisio Buparum. It inhabits Spain.

BUPARIAI, in Botany, Rhed. Mal. See Hibiscus typicus.

BUPHAGA, in Ornithology, a genus in the order Picus, of which only a single species has been hitherto discovered; and which, being a native of Africa, has received the name of African. The generic definition consists in having the bill frigate, and somewhat quadrangular; mandibles gibbous, entire, and more gibbous on the outside. Legs formed for walking.

Linnaeus and Buffon have given this bird the name of Buphaga, and Buffon that of Picc-bœuf, from whence the epithet of bee-eater is derived. French authors of the present day write it Pique Bœuf. All these names refer to a peculiarity of the African Buphagas, which sometimes alight upon the backs of the cattle, and pick holes in them, in order to get at the larvae of the affri, or gads-flies, deposited by those tormenting creatures in the flesh, directly below the skin.

The species African is between eight and nine inches in length. The prevailing colour of the plumage above is brown; beneath, and also the rump, yellowish. Bill scarcely an inch in length. Tail complete, and colling of pointed feathers. Legs and claws black.

BUPHAGIUM, in Ancient Geography, a town of Arcadia, situated in the western part of it, south of Telphusa. It derived its name from that of the hero Buphagos, the son of Japetus and Thronax, who was slain on the mountain Ptolema, for daring to offer insult to Diana. Paulanius, l. viii. c. 27, p. 678. Ed. Kuhnii. BUPHAGUS, a river of Arcadia, which took its rise near Buphagum, and discharged itself in the river Alpheus. Pantheas. BUPHONIA, from Bup., ox, and φυους, slaughter, in Anthiquity, an Athenian feast or ceremony, denominated from a bullish, which therein with quaint formalities.

The buphonia was properly a part or appendage of the ceremony of Dipulon. For the origin of the buphonia we are told it was forbidden by the laws of Attica to kill an ox: but it once happened, at the feast of the dipulon, that an ox eat the corn, others say the cakes, which had been dressed for the sacrificers. Thaulon the priest, enraged at this, presented killed him, and fled for it. On which the Athenians, fearing the retribution of the gods, and feigning themselves ignorant, who had committed the fact, brought the bloody axe before the judges, where it was solemnly arraigned, tried, found guilty, and condemned. And, in memory of this event, a feast was instituted under the denomination of buphonia. In which it was still customary for the priest to fly, and judgment to be given about the slaughter of the ox.

Gen. char. Cal. common, incrustated with a double or triple series of scales, in some species all equal and shorter than the ray of the flower; in others, the outer series longer and exceeding the ray. Cor. compound, radiate; florets of the disc numerous, funnel-shaped, with a five parted rather spreading border; of the ray more than ten, ligulate, spreading, three-toothed. Stam. stamens five, capillary, very short; anthers cylindrical, united into a tube. Fil. of the disc. Germ ovate, compressed; style thread-shaped; the length of the stamens; stigma, thickish, either simple or bifid. Of the ray, germ capitate; style thread-shaped; stigmas two, oblong. Peric. common, the calyx unchanged. Seeds of the disc oblong; of the ray compressed, with sharp edges; both crowned either with a toothed, or galled, and almost leafy margin. Receptacle chaffy, convex. Eff. char. Receptacle chaffy. Seeds crowned with a toothed or galled margin, with sharp edges, particularly in the ray.

Species 1. B. afishom Linn. "Leaves opposite, lanceolate; petioles two-toothed; sten shrubby." A small shrub about four feet high. Stem straight, jointed. Bark greyish. Branches bushy. Leaves opposite, oblong, broader towards their summit, narrowed into a petiole towards their base, ciliate like those of Lycium, glaucous, covered with a very close, short down, and marked with three longitudinal nervils. Flowers yellow, terminal, foliar, peduncled. Calyx-scales ovate, a little tomentous. Sepals rather broad, short, and toothed. Calyx terminated by a sharp point. La Mareck, from a living plant. A native of the West-Indies and Virginia. Cultivated in the royal garden at Hampton Court in 1699. 2. B. Persiivaniae. La Mareck Ence. "Leaves linear-lanceolate, silky, obtuse toothed about the middle; stem shrubby." Similar to the preceding but smaller, and of a more vilvory appearance. Leaves narrow, and without teeth at their base. Flowers yellow, terminal, foliar, Calyx-scales ovate; semi-scales scarcely extending beyond the calyx. La Mareck, from a living plant. Found by Dombe in Peru. 3. B. arborescens. Dill. Ed. Tab. 39. fig. 43. Plam. sp. tab. 106. f. 2. "Leaves opposite, lanceolate, without teeth, thick, green." La Mareck. An evergreen shrub. Stems two or three feet high. Leaves opposite, connate, lanceolate, narrowed at their base, very entire, entirely green and glossy. Flowers yellow, terminal, foliar; semi-scales short; calyx-scales, large and smooth. La Mareck, from a living plant. 4. B. repens Linn. Hort. Clus. 44 (Verbeina mutica fop. plant.) but not Chrysanthenum humble of Plumier. "Leaves opposite, feathery, three-lobed; stem creeping." Stem jointed, producing at its joints small fibrous roots, and straight, leafy, flower-bearing branches. Leaves opposite, feathery, broad toward its summit, irregularly toothed, with three sharp-pointed lobes. Flowers yellow, silky, terminal. La Mareck. Native of South America. 5. B. durum Linn. "Leaves alternate, lanceolate, very entire; stem somewhat shrubby." Root perennial. Stem a little woody, branched near the top. Leaves alternate, oblong, entire, narrowed at their base, a little broader towards the summit, and terminated by a short point. Flowers terminal, foliar. Calyx-leaves rather large. La Mareck. A native of the Cape of Good Hope. 6. B. sericenum. Linn. Jun. Sup. "Leaves opposite, crowded, fruticose oblong, silky; calyx-scales brittle-shaped, shaggy; stem woody." Branches thick, woody, covered with the marks of former leaves. Leaves
Flowers on the smaller branches, very entire, clothed with a white, clove, and very soft pile. Flowers terminal, large, yellow. Lower calyx-florets larger, linear. Linn. jun. Gathered by Maffon in the island of Teneriffe. 7. B. speciosissimum Linn. Mant. "Leaves alternate, embracing the stem, ovate, naked, ferrate, somewhat ciliate; stem one-flowered." Root perennial, spindle-shaped. Stem too feet high, smooth, and even, marked with very fine white lines. Leaves alternate, acute, somewhat heart-shaped, compact, reticulated with veins; petioles dilated at the base, somewhat membranous. Calyx common imbricated with obtuse, ovate, large leaves. Florets of the ray folded, two or three-toothed, yellow; of the disc four-parted, erect, pedicelled. Stamina of the disc four, brown, without a germ. Germ of the ray ovate. Seed of the disc none; of the ray ovate, membranaceous. Receptacle hemispherical. Zoga, quoted by Linnaeus. Linnaeus places this species under Buphthalmum, but doubts whether it is not rather a Silphium. From Zoga's description it clearly belongs to the order polygonum necessarian. A native of the mountains about Brixen in the Tirol. B. grandiflorum Linn. La Marec. Illust. Pl. 683. fig. 1. "Leaves alternate, lanceolate, somewhat toothed, smooth; calyces naked, stem herbaceous." Root perennial. Stems numerous, growing in tufts, generally simple, about a foot and a half high. Leaves alternate, linear-lanceolate, sharp-pointed, smooth, slightly toothed. Flowers yellow, large, about two inches in diameter, terminal. Calyx rather short; composed of two rows of narrow-pointed leaflets. La Marec, from a living plant. 9. B. fulicifolium Linn. (Gart. Tab. 169. f. 1. copied by La Marec ill. Pl. 682.) "Leaves alternate, lanceolate, somewhat ferrated, pubescent, calyces naked; stem herbaceous." Root perennial. Stem a foot and a half high, straight, cylindrical, pubescent, reddish, divided at its summit into two or three short branches. Leaves embracing the stem. Flowers large, yellow, terminal, solitary, semi-florets very narrow. La Marec, from a dried specimen. Receptacle slightly convex; chaff the length of the calyx, broader upwards, keeled, toothed, the keel extended into a short, flexible arm. Seeds of the disc smaller, oblong, narrow, three or four-cornered, a little compressed, straight; of the ray, larger, incurved, three-sided, drawn out at the sides into a kind of wing: in both, truncate at the top, and crowned with a toothed rim. The rim of the seeds of the disc is sometimes so deeply gilded, as to appear composed of several chubby bristle-shaped leaflets. Gart. A native of the South of France, Austria, Switzerland, Lusatia, allied to the preceding, to which Gouan joins it, but differs in being abundantly pubescent, and having narrower semi-florets. 10. B. helianthoides Linn. (G. Herteric. flr. nov. Tab. 45. Helianthus levis. Linn. sproc. 1278. Silphium Solidaginoides. Linn. sproc. 1302. Rudbeckia opulifolia. Linn. sproc. 1282.) "Leaves opposite, ovate, ferrated, triplicate; calyx leaf; stem herbaceous." Root perennial, whitish, branched, fragrant. Stems several, two yards high, upright, branched at the top, naked at the base, round, the thickness of a quill, of a sea-green colour: branches opposite, stiff like the stem. Leaves remote, acuminate, ferrated about the middle, decurrent, veined, and wrinkled, flat, rechining, four inches long, two and a half broad. Petioles spreading, embracing the stem with a kind of ring, round on one side, channelled on the other, edged at the top by the leaf running along them. Flowers terminating, yellow, from two to three inches broad; peduncles commonly three, accompanying the uppermost leaves, stiff, very long, one-flowered, obscurely angular, thickened at the top, piliferous, sometimes with one or two linear sharp bracts. Common calyx concave, spreading, pubescent; petals lanceolate, acute, a little ferrated; those of the inner row spreading, and reflexed at the tip; those of the outer row few, twice the length of the other, and a little hanging down. Florets in the disc numerously, with a sharp, revolute border; in the ray about twelve, lanceolate, retuse, two-furrowed above, two-nerved beneath, spreading very wide, twice or three times the length of the calyx. Germ in the disc oblong, four-cornered and truncate; in the ray three-cornered. Seeds without any pappus or down, except the rim, which is scarcely thickened. Receptacle conical; chaff membranaceous, linear, acute, channelled-cone. This plant has the generic character of buphthalmum, the calyx of silphium or rudbeckia, and the habit of helianthus. Hence it has inadvertently been given by Linnaeus under four different names. L'Her. A native of North America, whence it was sent by Catesby to the botanic garden at Chelsea, but is said by Ferrler to be found wild every where within the tropics. La Marec describes a plant under the same specific name, brought from South America, cultivated in the royal garden at Paris, which does not correspond with the above description, and with some doubt whether it be that intended by Linnaeus. Its stems are herbaceous, feebly, not much more than a foot high, growing in loose tufts. Its leaves petioled, generally opposite, ovate, a little pointed, obtusely dentate, green, almost smooth, and feebly an inch broad. Flowers yellow, rather small, solitary, peduncled and terminal. Calyx of two rows of oblong scales, those in one row not longer than those in the other. The juice of the plant is a little caustic. 11. B. finfofinum, Linn. (La Marec, Pl. 682. fig. 2.) "Calyces acutely-leaved; leaves alternate, lanceolate, embracing the stem, very entire; stem herbaceous." Root annual. Stem a foot and half high, stiff, hairy, with two or three alternate branches at the top. Root-leaves long, spreading, broader and almost obtuse at their summit, narrowed at their base. Stem-leaves lanceolate, hairy. External calyx-leaves very long, three-nerved, ending in a spine, spread open immediately under the flower like the points of a star. Flowers yellow, solitary, terminal; semi-florets very narrow. La Marec, from a living plant. A native of Languedoc, Spain, and Italy. 12. B. aquatimum, Linn. (Gart. Tab. 169. copied in La Marec, Illust. Pl. 682. fig. 4.) "Calyces obtusely-leaved, fifeile, axillary; leaves alternate, oblong, obtuse, stem herbaceous." Root annual, white, fibrous. Stem about a foot high, much branched, cylindrical, pubescent. Leaves alternate, fifeile, oblong, obtuse, hairy. Flowers yellow, rather small; some fifeile and axillary, others terminating; semi-florets broader and shorter than those of the preceding species. Outer calyx-leaves obtuse, soft, forming a kind of involucro to the flower. La Marec, from a living plant. Calyx leafy at the base. Seeds compressed, bay-coloured, bifid, with whitish bristles, nearly uniform; those of the disc smaller, ovate, acuminate downwards; those of the ray larger, triangular-wedge-shaped, much compressed at the sides, and almost winged; both of them crowned with a many-leaved pappus, the leaflets of which are membranaceous, acuminate, ciliate-toothed, half the length of the seed. Gart. A native of the south of France, Portugal, and the Isle of Candiis. 13. B. maritimum, Linn. (La Marec, Pl. 682. fig. 5.) "Calyces obtusely leafy, peduncled; leaves alternate, spatula-shaped; stem herbaceous." Root perennial. Stems numerous, six or seven inches high, hairy, branched. Leaves long, obtuse, very narrow at their base, hairy. Flowers yellow, rather large, solitary, terminal. External calyx-leaves resembling those of the stem. Native of Sicily and the southern parts of France. La Marec. 14. B. villosum, Martyn's 'Miller. "Calyce leaflets acute, connected laterally; leaves opposite, lanceolate,
late, carved back." *Salm* herbaecous, two feet high, upright, round, whith, smooth, branched. Leaves linear-lanceolate, unequally toothed, smooth, juicy, thick, all-coloured. Uorse large, foliary, Caflp hemispherical, with sharp leaves, connected by a lateral membrane. Disc of the corolla flat, with yellow flowers; ray wide, spreading, with many white, disk flowers. Receptacle flat, with very small chaff; crown of the disks margined. *Sinja* in the flared of the disk simple. *Lorr. Cochin*. It is an \odious plant, and cultivated in the gardens of China as a pot-herb. *Burdeus* found in Norfolk Island; *B. procumbens*, found in the Friendly Islands. *Off. Jull. doubts whether the fraxitent species, with opposite leaves, should be placed in the same genus with those that are herbaecous and have alternate leaves. And *Gartn. is of opinion, that if the feed in all the *Afteris of Tournefort*, be not merely margined, but leafy, they ought to form a separate genus.

**Description and Culture.** The first two species can be propagated in this country, only by cuttings, which should be taken off in July when the plants have for some time been exposed to the open air; planted in small pots filled with light loamy earth, and plunged into a hot-bed of a very gentle warmth; shaded from the heat of the sun, and occasionally refreshed with a small quantity of water. In about six weeks they may be gradually acclimated to the open air, and soon after should be transplanted into fresh pots; when they have taken root, they may remain in a sheltered situation, till the middle of October, and should then be removed into the green-house. The first sort is harder than the other. The seeds of *Spinafior* and *Aquaticum* may be sown on open borders, either in the beginning of April, or, which is better, in Autumn, and will require no other care. The *Maritimum* is easily propagated by slips during the summer season, and requires the same treatment as the first and second, but will thrive better in a common frame, screened from frost, than in a green-house. The *Filicinis*, *Grandiflorus*, and *Behnianus*, may be propagated by parting the roots towards the end of October.

**Buphthalmum* campaniflorum* leuconothum. Pluk. See *Chrysanthemum frutescens.*

**Buphthalmum** lanuginosum, C. Bauh. See *Anacyclus valentinus.*

**Buphthalmum** rotula folio, and *floro leuto. 2, 3. C. Bauh.; *transfolium*, J. Bauh.; *creticum*, Breyt.; *alterum pennis*, Dalch.; *flor purpurascens*, Cam.; and *nervosum*, CUS. See *Anthemis valentinus.*

**Buphthalmum**, Liney Hort. Clif. 415. See *Amellus lychnitis.*

**Buphthalmum birratum**, Brown 1. 321. See *Silphium trilobatum.*

**Bupleuraria**, in *Entomolog*, a species of *Phalla* (Geometra). The wings are dotted, green, with a white streak, and a smaller one of the same colour; margin dotted with brown. *Fabr.*

This inhabits Europe. *Knoch describes it under the name of Phalaen fujurinii.*

**Bupleurifolia**, in Botany, Pluk. See *Corymbium cerebrum.*

**Bupleurigides**, Walch. See *Phyllis nodosa.*

**Bupleurum**, (from *phalos* and *plutos*, bowis cura, the rib or side of an ox, alluding, as explained by professor Martin, to a suppressed ill quality of building kine that fed upon it; but this explanation is better suited to the etymology of *phalos*, from *phalos* and *plutos*, to infringe, a name given by the Greeks, not only to an infant of the eunuch kind, but also to a plant noxious to cattle, which has been supposed to be the same with the bupleurum of Nicander, *Phallus*, and other ancient writers. Ventenat, with greater probability, is of opinion, that the name bupleurum alludes to the *fdaa*, (reindeer) of the leaves of several species of this genus. The name derivation was intimated long ago by Dodonaeus, who, speaking of the probable identity of the plant, now called bupleurum, with the ancient one, says, "nece pellime quadratam nomencluderit et illuciam visor: folia namque longissimus, multae frutices rigidissimae, quae collas in foliis sanguinis efficiantibus, et laterum modo inclusi, ut de heptapleurio loquitur Pinus."

Gen. Ch. Cal. Umbel universal, with fewer than ten rays; partial with scarcely ten, erect-expanding. *Involucrurum* universal, either of many leaves, or of from three to five, none; partial of several broad leaves; either distinct, or all united at the bottom; *perianth* proper, obsolete. *Cor. universal, uniform; florets all fertile, proper, petals five, involucre entire, very short. Stem. five, simple, anthers round. *Pylr. Gere inferior. Styles two, reflexed, small; *ligula* very small. *Peric. none. Fruit roundish, compressed, splitting in two. *Seeds* two, ovate-oblong, convex on one side, flat on the other. *Off.* In most of the species, the partial involucres are fleshy, often longer than the corolla.

**Effen. Char. Leaves of the partial involucres broad, spreading. Fruit ovate, gibbous, small, not crowned at the top.**

**Spec. *Herbaecae.* 1. B. retundalorum, Linn. Huds. 111. With. 267. Smith 124. (Perfoliata C. Bauh. &c.) Gart. Tab. 22. fo. 7. La March, 1st ed. 180. Eng. Bot. 99. Thoro-whax. "Universal involucres none; leaves perfoliate." Linn. *Root* annual, small and fibrous; whole plant rigid and smooth. Stem erect, alternately branched, round, leafy, perfoliate. *Leaves* alternate, ovate, acute, very entire, somewhat glaucous, curled. *Umbels axillary* and terminal, solitary, on long peduncles, five or seven-rayed, entirely delirious of an universal involucrum; little umbels of about eight flowers; partial involucres of five, ovate, acute, unequal leaves, longer than the flower. *Flowers* yellow, on short peduncles. *Dr. Smith*, and La *March*. *Fruit* small, ovate, inflated, gibbous, black. *Seeds* ovate-oblong, gibbous, terminated at the top by a very narrow, reddish-brown disk; marked on the convex side with thirteen elevated, linear frills or streaks; on the flat side with a simple furrow. *Gart.* It derives its English name from its perfoliate leaves, or as professor *Martin* accurately expresses it, from the singular circumstance of the stalk running or growing through the leaf, by which it may be distinguished from all other indigenous plants. Like the fanatic, it has the reputation of being a vulnerary; but this, says Dr. *Smith*, (Eng. Bot.) is a quality which no medicine can have, any otherwise than as a tonic, strengthening the constitution; nor can any external application be specifically healing or consolidating, or be useful in any other way than as a defence from the air. *La March* speaks of it as an all-rigent, and says that it is used as a callaphe in unblissful ruptures: but in this case, its operation can be only mechanical. A native of most parts of Europe, chiefly on a calcareous soil, but not very common in England. *Martin* intimates, that it is peculiar to the southern countries, and says, that he has never observed it, except among wheat. We have occasionally found it in the neighbourhood of Leeds, but always among beans. 2. B. *hellatum,* Linn.
“Leaves of the partial involucres united; universal involucre of three leaves.” Root perennial. Stem about a foot high, round, almost raked, often simple. Root-leaves very long, smooth and grass-like. Universal involucre of five, or six rays. Universal involucre of one, two, or three lanceolate leaves. Partial involucre of one leaf, cut off entirely at the edge of eight or nine segments, surrounding the flowers in the form of a cup, or basin. La March and Martyn. A native of the Alps of Switzerland, a d Dauphiné, introduced into England in 1775 by Dr. Pitcairn and Dr. Fathergill. 5. B. petraenum, Lindl. and Willd. “Partial involucre united; universal involucre of five leaves.” Linn. “Little involucre of about five united leaves; universal involucre of five leaves; stem-leaves heart-shaped lanceolate, embracing the stem; radical leaves linear.” Willd. Radical leaves linear, sessile. Leaves of the universal involucre five, equal, rather broad; of the partial involucres five, united as far as the middle. Linn. A native of the Alps of Switzerland. According to Villars this is only a variety of the preceding. 4. B. graminifolium, Willd. (B. petraenum, Jacq. Collect. 1. p. 293. Icon. rar. t. 56. Vill. ddb. 2. p. 576. t. 14. Alion. Aud. p. 24. La March. Flor. France. 1990. Encyc. vol. i. 517. Martyr in Miller; description but not the specific character nor all the synonymy. Sedum petraceolum bupleuri folio, Pou. bald. 247. B. alpinum, Seguier Veron. 2. p. 15. 3. p. 221.) “Root-leaves long, very narrow, grass-like; partial involucre distinct, general one of about five leaves.” La March. Root perennial, long, thick toward the top. Root leaves numerous, five or six inches long. Stem about eight inches high, round, simple and leafless, or having a single branch near the top, with one leaf at the base, and an umbel of flowers at the end, smaller than that which terminates the stem. Umbel lozenge, of fix or seven rays. Universal involucre of three or five leaves; partial involucre of five, six or seven small, lanceolate, serrated, very distinct leaves. A native of the mountains of Dauphiné, Provence, and Switzerland. 5. B. angustifolium, Linn. (B. ranunculoides & La March.) “Partial involucre five-leaved, orbiculate, general involucre three-leaved, ovate; leaves embracing the stem, heart-shaped lanceolate.” Nearly allied to B. Rellatum, but the leaves of the partial involucre are always distinct: it varies in having its leaves very narrow and rounded, or lancesolate, and not serrated. Linn. The former variety is a native of Switzerland, the latter, of the Pyrenees. 6. B. pyracetum, Willd. (B. pyracetum, Gouan and La March.) “Partial involucre rounded, emarginate, united; universal three-leaved, cut at the base; leaves lanceolate, heart-shaped, embracing the stem.” Willd. It differs from B. angustifolium in having much broader, lanceolate, acute leaves, the radical ones nearly at the base; and in the rays of the umbel being shorter and fewer; as well as in the peculiar shape of the general and partial involucres expressed in the specific character; from B. Rellatum which it resembles in habit, in its broader leaves, those of the stem being much more numerous and heart-shaped at the base; and in the number of the divisions of the partial involucres. Willd. A native of the Pyrenees. 7. B. longifolium, Linn. “Partial involucre five-leaved, ovate; general one of about five leaves; leaves embracing the stem.” Root perennial. Root-leaves narrowed into a petiole at their base, and broad towards their summit. Stem-leaves ovate, acuminata. Umbel terminal, composed of from six to nine rays. It resembles B. rotundifolium, but differs in its perennial root and longer leaves. Native of mountains in Germany, Switzerland, &c. B. B. falsatum, Linn. Hare’s-ear. “Partial involucre five-leaved, acute; general, commonly five-leaved; leaves lanceolate; stem zigzag.” Root perennial. Stem upright, about a foot high, slender, round, slightly zigzag, much branched, sometimes tinged with purple. Leaves frequently sickle-shaped; those next the root narrowed at their base into petioles, ovate-lanceolate, bright green, smooth, a little nerves; the others almost linear. Universal involucre of five, or six rays; partial, of five to twelve. Universal involucre of from two to five, very unequal, lanceolate, sharp leaves, partial, of five lanceolate, regular leaves, the length of the partial umbel. A native of dry rocky soil in the south of Europe. It has the character of being a vulgar and trifid. La March and Martyn. 9. B. cariciifolium, Willd. (B. gramineum, Villars.) “Partial involucre, five-leaved, sharp-pointed; universal one-leaved, lanceolate; leaves linear, attenuated at the base.” Root perennial. Radical leaves very long, acute; stem-leaves, the lower ones a little attenuated, the rest sessile. Umbel of five or six unequal rays longer than the involucre. Partial involucre five-leaved, lanceolate, sharp-pointed. Willd. from a dried specimen. A native of the south of France and Switzerland. 10. B. edontites, Linn. “Partial involucre, five-leaved, acute; universal, three-leaved; the central floret higher; branches divaricat.” Linn. “Both involucre five-leaved, bellate; leaflets lanceolate, three-nerved; rays of the umbel very unequal.” La March. Root annual. Stem from three to eight inches high, somewhat angular, much branched. Leaves linear-lanceolate, narrow, smooth, sessile. Involucres awned, concealing the umbels. La March and Martyn. Seeds only a quarter the size of those of B. rotundifolium, not fringed, either slightly wrinkled or entirely plain, ovate-cylindrical, brown or blackish. Gartn. A native of the south of Europe. 11. B. fimbriatum, Linn. “Umbels both compound and simple.” Root annual. Stem fix six inches high, furnished from its base with alternate, rather divaricat branches. Leaves oblong, narrowed into petioles at their base, broad and obtuse at their summit, and ending in a particular small point. Simple umbels peduncled; compound, almost sessile. Allied to the preceding, but differing from it constantly in such remarkable characters, that it ought to be regarded as a variety. La March. A native of the south of Europe. 12. B. ranunculoides, Linn. “Partial involucre, five-leaved, longer; universal, three-leaved; stem-leaves lanceolate.” Root perennial, creeping. Stem about eight inches high, simple. Leaves grass-like, stiff. Umbel unequal. Universal involucre ovate, acute, short; partial, equal, obovate, acute. Partial umbels small, the length of the involucre. La March follows Haller in uniting this species with the angustifolium. Gouan adds the petraceum, to which Villars objects as far as the sedum petraceolum bupleuri folio, gathered by Pana on Mount Baldo is concerned, the graminifolium of Veke and this dictionary; but Villars himself suspects that the angustifolium, and his graminifolium, which is Willdenow’s and our caricifolium, may be only varieties of ranunculoides. A native of Switzerland and the Pyrenees. 13. B. rigidum, Linn. “Stem dichotomous, almost naked; involucres very small, acute.” Linn. “Stem much branched, panicked, almost naked; lower leaves petioled, nervet, rigid; umbels generally of three rays.” La March. Root perennial. Stem slender, nearly two feet high. Lower leaves lanceolate-elliptic, with strong white nerves; upper leaves very small and dilated. Umbels terminal, of two, three, or four rays. Universal involucre of three awl-shaped, very short leaves; partial, of five. Linn. and La March. A native of the south of France. 14. B. lenicinum, Linn. “Slender thorough-wax, or leaf hare’s-ear.” (Eng. Bot. 478.)

“Umbels
"Umbels simple, alternate, generally three-flowered; involucres of five awl-shaped leaves. Dr. Smith. "Terminal umbel compound; lateral, simple, with few flowers; involucres universal and partial, short." La Mareck. Root annual, tapering, but little branched. Stem about a foot high, zig-zag, slender, stiff, smooth, erect, with several alternate branches. Leaves alternate, lanceolate, narrow, pointed, entire, tapering at the base. Umbels axillary, nearly sessile, foliary, generally three-flowered; involucres awl-shaped, longer than the flowers. Dr. Smith. Terminal; umbels compound, of from three to five rays; with a general involucre of from three to five short, pointed leaves; lateral, simple, and extremely small. La Mareck. Fuller remarks that the umbels can scarcely be said to be really compound. Fruit small, ovate-oblong, tranversely thicker, rounded on each side, somewhat emarginate. Seeds pentagonal-prismatic, marked on the convex side with three acute-angled and distast ribs; the intervals a little wrinkled, of a pale or ash colour. A native of Germany, France, Italy, and England. It is found plentifully in salt water ditches on the coasts of Norfolk, Suffolk, &c. and, as is asserted by Hudson, more sparingly inland, about Cambridge and Huntingdon; but professor Martyn observes, that it has probably been overlooked in many other places; being a plant of little appearance and almost lost among the grass. 15. B. baldejus, Wild. "Stem erect, branched; leaves linear; universal involucres of about four unequal leaves, shorter than the umbel; partial involucres five-leaved." Root perennial. Radical leaves linear, broader at the base. Universal involucres of three or four leaves, two larger than the others. A native of Croatia, Carniola, and monte Baido. 16. B. Gerard, Murray Syll. 274. (B. junceum, Marn. Roth. Pollich. jun. &c, jun. &c, La Mareck.) Ger. Prov. 335. Tab. 9. foro. "Stem crenate, much branched; leaves linear, acuminate; universal involucres five-leaved; partial, five-leaved, linear-awl-shaped, longer than the umbel." Root annual. Stem from six to nine inches high, slender, smooth, with straight stiff-mixed branches. Leaves linear, grading-like, clasping the stem, ending in a very short point, marked with three fine nerves. Umbels on long peduncles, lateral and terminating. Universal involucres four or five leaved, linear, awl-shaped, very unequal; partial, four or five-leaved, linear-spatulate, unequal, longer than the flowers. Flowers nearly sessile. Seeds oblong, flattened, appearing, as if cut off at the tip. A native of Provence and Austria. 17. B. junceum. Linn. &c, Li Mareck. "Stem crenate; pinnate; leaves linear; universal involucres three-leaved; partial, five-leaved." Root annul. Stem from two to three feet high, straight, round, hollow within, branched in the upper part. Umbels small; lateral ones simple, of one or two flowers; terminating one compound, of two or three short rays. Universal involucres of two or three leaves, awl-shaped and unequal; partial, of about four linear-awl-shaped leaves. A native of the south of France, Italy, and the Levant. 18. B. arboreofsim, Wild. "Leaves oblong, very entire, petiolate." Thumb. Prod. 50. It differs from the preceding in having petioled leaves, very acutely, not bluntly, pointed at their summit; and umbels only half as large, on short peduncles. 21. B. coriaceum, Martyn and Wild. Att. Kew. L'Heret. Stirp. nov. (arboreofsim Jacq. C. R. 2. tab. 351. obliquum Vahl. Symb. gbraitemicum, La Mareck Encey.) "Leaves lanceolate, attenuated on both sides, very entire, sessile. Wild. "Leaves lanceolate, coriaceous, oblique." Hott. Kew. Root perennial. Stems from three to four feet high, upright, sparingly-branched, round, annulated with the scars left by the fallen leaves. Branches alternate, upright, marked with these fibrous; Leaves alternate, approximating, long, acuminate, a little coriaceous, half embracing the stem, with a sharp, reflexed point, and one whitish nerv, glaucous, permanent, five inches long and near an inch broad. Umbels of about fifteen rays, alternate, on a common peduncle terminating each branch, with a few leaves on its lower part, a foot and a half long, and not half the thickens of the branch from which it springs. Universal involucres of about eight, oblong, acuminate, slightly convex, reflexed leaves; partial, five-leaved, smaller, ovate. Seeds oblong, rounded on one side with five wings, flat on the other. The whole plant is very fragrant when rubbed. La Mareck and Martyn from l’Heretier. A native of Spain near Gibraltar; found by Maffon, and introduced in 1784. 22. B. fruticosum, Linn. "Leaves linear; involucres universal and partial." A native of Spain, 23. B. fruticosum, Linn. jun. Supp. "Old branches of the panicle naked, thorny; leaves linear." Root perennial. Stem low, irregular, with divaricated branches. Leaves acuminate, three-nerved. Universal umbel terminal, generally of three rays, which change into spines after the fruitification is completed; partial, of five rays. Involucres of very small leaves, equal in number to the rays. Linn. Jun. and La Mareck. A native of Spain. 24. B. difform, Linn. "Spring leaves decumbent, flat, grafted; summer leaves filiform, angular, trifid." Stem from five to six feet high, franglant, a little twilled, branched. In winter, and the beginning of spring, it bears two sorts of leaves; the first small, petiol, composed of three, flat, trifid, grafted leaflets resembling those of parsley; the others longer, linear, filiform, angular, divided half way down into three filiform segments, the middle one the longest, and each terminated by a very small point. If summer the former kind fall off. La Mareck. Universal involucres of many awl-shaped, thriviling leaves, connected at the base; partial, of five leaves. Umbels some simple, others compound. Linn. A native of the Cape of Good Hope.

Propagation and Culture. The buplenniums in general are cultivated only in botanic gardens. The seeds should be sown in autumn, where the plants are designed to remain, for they are injured by transplanting. The fruticosum, called by our gardeners shrubby Ethiopian Hartwood, will thrive in the open air, and is propagated by cuttings planted in pots filled with fresh loamy earth, and sheltered in winter under a hot-bed frame; they will take root in spring, should be placed in a shady situation in summer, and will not be fit to transplant till the autumn. The fruticosums may be treated in the same manner, but is not so hardy. The difforme may also be propagated by cuttings, which readily take
take root if planted in April, in pots filled with light earth, and plunged into a moderate hot bed. They should afterwards be ensured to the open air by degrees, be transplanted into separate pots, placed with other exotics in a sheltered situation till autumn, and then removed into the green-house or dry house. If propagated from seeds, they should be sown in autumn, sheltered under a frame in winter, removed to a very gentle hot-bed in spring, and finally treated like these raised from cuttings. The spinoform, nudum and coriaceum may all be propagated by cuttings, and treated as the others. They will probably bear the open air in mild seasons, but are not yet sufficiently common to run that hazard. MARTYN’S MILLER.

BUPORTHUS, in Ancient Geography, a mountain at the extremity of the peninsula formed by the Argolid, south-east of Peloponnesus. Upon this mountain were two temples, one of Ceres and Proserpine, and another of Minerva and Pan. Panathenae.

BUPRASION, a town of Achaia, at a small distance north of the river Peneus and of the town of Elis, which gave name to a fruitful country in which it was situated. It did not exist in the time of Strabo.—Alfo, a river of Peloponnesus, in the country of Elis. Steph. Byz.

BUPRESTIS, in Entomology, a genus of coleopterous insects, distinguished in a peculiar manner for the uncommon brilliancy and highly metallic splendour of their colours, which emit the finest and most beautifully polished metals. The insects of this kind have the antennae serrated, and as long as the thorax; feelers four, which are also filiform, with the last joint obtuse, or truncated; head partly retracted within the thorax.

Linnaeus, Fabricius and Gmelin describe the following species: unidentata, bicolor, gigantea, vittata, fallax, punctatissima, bicornis, cornuca, decora, lirata, oblicrura, punctata, fasciata, rufca, firiata, ritulans, ocyguttata, ignita, lineata, occelata, aerora, maculata, maculofus, rufca, loricaria, chrysis, violacea, aegyptica, mariana, farinosa, fulminans, cyanipes, modelia, blanda, aurata, tripunctata, elegans, chrysoligata, dorsata, impellera, ornata, taeantia, carycineria, cyllindrica, fuscra, trochilus, decldigna, rufca, canaliculata, acuminata, plebeja, tranquebarica, lugubris, cariosa, undulata, anritnica, fribica, splendens, fusca, auruta, tenebrionis, tenebriuscularis, varicoloris, onopordi, hirta, rubra, deaurata, nitidula, lea,fails, cyanca, dicotidea, bimaculata, quadrimaculata, novemmaculata, tridens, deciprata, cucprea, nobilis, barbarica, uniusbellarum, quadruptionata, cruciata, manca, pygmaea, minuta, meditubata, viridis, bidentata, atra, elata, ruficollis, fulvice, linearis, granularis, depreffa, calcicara, fulgirosa, luzemmordialis, quercus, hirufa, 11-maculata, fexmaculata, varicoris, acuta, nuzca, pia, inaurata, tatarica, virginiaca, nana, marginata, nigra, rofacea, ungurica, nebulofo, bruttia, flaphaniellus, rugofo, and coccinia, which see respectively.

A monograph of the buprestis tribe is expected from the pen of Dr. Schreiber of Vicenza, which, in all probability, will contain a greater number of species than those enumerated above. Several entirely new species are also described by Mr. Donovan in his recent elucidation of the entomological productions of New Holland; the most remarkable of which are buprestis grandis, macularia, limbata, futurialis, guttata, and several varieties of variabilis, and imperialis, the last of which is mentioned by Fabricius. Synt. Eleuth.

Some writers affirm that the larvae of the buprestes live in the solid wood, or in the trunks of decayed trees; but this is rather uncertain, since they do not appear to be exactly known in that state. The conjecture is, however, plausible, the perfect insects being almost constantly found upon trees, or plants, and flowers. Few species of this beautiful tribe of insects are found in Europe; the largest and most brilliant of those hitherto discovered, are from the Brahils, and other hot climates.

BUPRESTIOIDES, a species of Attelabus (Spordylis), the colour of which is black; shells nervous; thorax somewhat globular. Gmel. Fabr. &c. Described as Buprofis anser by Linn. Cerambyx maxillosus, &c. Degeer. Scarabeus, &c. Franch.

Buprestoides, a species of Caramus, of a black colour; antennae and feelers ferruginous; legs pigaceous. Inhabits the fourths of Europe. Gmel. &c.

BUQUO, in Geography, a town of France, in the department of the Straits of Calais, and district of Arzas; 5 miles W. of Bapaume. N. lat. 50° 14’. E. long. 2° 40’. BUR Parfrey, in Botany. See CauCulis.

Bumseed. See Starnanum.

Bura, in Ancient Geography, a town of the Peloponnesus, seated on the ridge of a mountain, west of the river Crathis. It suffered much from an earthquake in the year 373 B.C. Paunianias mentions several fine statues of this city, and particularly those of Ceres, Venus, Bacchus, and Lucina. Venus had a temple, in which was placed her marble statue, made by Lucid, an Athenian statuary. BURA, in Geography, one of the smaller Orkney islands, between Yomona and Ronalda.

BURACO do sol, in Ichthyology, the name of a fish caught on the shores of the Brahils, and more usually known among authors by its Brazilian name, Guaiba-coara.

DURACRAG, in Geography, a river on the coast of Barbary, which rives in mount Atlas and falls into the Atlantic ocean at the town of Salle.

BURAMOS, an idolatrous people of Africa, in Nigritia, on the borders of the river St. Domingo. Their country extends to the mouth of the Rio-Grande.

BURANELLO, in Biography. See Galuppi.

BURATTI, or Burats, in Geography, the name of a barbarous and idolatrous nation, which occupies part of Siberia. They are called Bravi by the Brahils, and among themselves Barga Burats. About the time of the Mongolian monarchy, or perhaps at an earlier period, they seem to have taken refuge in the wild mountainous region on the north side of the Baikal, which they still inhabit. The Brahils found this nation in Siberia, when they conquered that country; and from the year 1647 they have peaceably submitted to the Ruffian supremacy. The whole nation is at present, in consequence of the border treaty, under the dominion of Russia, and composes numerous heathenish people in the government of Irkutsk, where it inhabits the region from the Yenisey, along the Mongol-Chinese borders, on the Angara, Tunguska, and the upper Lena, about the southern Baikal, on the Selenga, the Argoon, and its rivers. Several years ago this government was computed to contain 32,000 tributary Burats; but their present number is probably four times as large. They are divided into a great number of tribes, called " Kolbonda," which are subdivided into cafis, or " Amaks," and each Amak is composed of a certain number of "Chottons," or villages, containing 10 or 20 families. The oldest of the Chottons governs it, and chief of these Chottons is subject to a "Schulfeng," or judge, chosen from among their chiefs, and confirmed in his office by the governor of the province. Twenty-four Schulfengs form a tribe or Kolbonda, which is commanded by a common chief, selected from among the families of their ancient princes. It is his province to watch the
the observance of the laws, to decide disputes, to diminish or augment the tribes, and to assemble and command the proportion of recruits, which are furnished by the nation in time of war, till they are united to the main body of the army.

Catherine II. with a view of annexing dignity to this chief, gave orders that he should wear a girdle ornamented with silver, on which is inscribed the name of the chief he commands; and the Buratt has become proud of this decoration, though it is merely a mark of his slavery. According to the accounts taken in 1792, this nation forms 65 calls, containing 32,000 bow or heads of families; and as they speak the Mongol language, profess the religion of the Kalmucks, lead a similar kind of life, and manage their flocks in the same manner with the Bashkirs, it will be sufficient to refer for an account of several particulars relating to them to the articles Bashkirs, Kalmucks, and Mongols. They have, however, some customs peculiar to themselves. They are allowed to marry as many wives as they can afford to purchase; and the price of a bride is paid in cattle of different kinds. A young girl, according to her beauty and character, may, among the rich, receive 100 horses, 20 camels, 50 horned cattle, 200 sheep, and 30 goats. When the cattle are delivered, the nuptials are celebrated. For this purpose they erect a "Jurte," of felt, entirely new, of a white colour, and very neat. The three first days are spent in feasting, singing, and dancing; and on these occasions the musical instrument is a guitar with two strings, resembling that which the Russians call "Balaika." At the expiration of these three days, the marriage is consummated. When a husband dies and leaves several wives, the he who has borne him children, or the child of such as have had children, becomes the mistress of the Jurte. Those who have had no children, return to their relations on line of horses, and carry with them the clothes and presents which they received from the husband. If they have no place of retirement, they continue in the Jurte, subordinate to the wife mother, and are entitled to the tenth of the cattle left by the husband. The Burati resemble the Kalmucks in outward form, with some slight variations. Their countenance is fair, and though they are tall, their bodily structure is feeble, and they seldom attain to an advanced age. They formerly suffered much from the small-pox, but since an inoculation has been introduced at Irkutsk, the mortality seems to have been much diminished. They now frequently inoculate their own children. They are much subject to the itch, from their manner of living, food, and clothing. In chronic diseases they use the warm baths on the coast side of the Bashkirs. Their physicians are the Shamans, who pretend to heal them more by sacrifices, incantations, and spells, than by natural means. They submit to the chace and by their flocks. A Bu is known to police a thousand sheep, besides horses, and other cattle. Their habitations are hexagonal cabins, constructed with beams laid over one another, to the height of about 3 feet, with an opening formed at the top by flaxes for the discharge of the smoke. The Burats are a principal branch of the Kalmucks, and differ from the Tungus only in their language, which is Mongolian. Tscheko's View of the Russian Empire, vol. i. and ii. Chartres' Travels in Russia, vol. ii. Eng. ed.

BURAZ, a town of Afiaitic Turkey, in the province of Natalia; 38 miles S. E. of Degniuzu.

BURBACH, a town of Hungary, celebrated for its wine; 8 miles E. of Eisenstadt.

BURBARUS, in Ichthyology, the name given by Paul Jovius, and some other writers on fishes, to the common carp, Cyprinus carpio.

BURBAS, in Commerce, a small coin at Algiers, with the arms of the city struck on both sides, worth half an apsar.

BURBER, an Egyptian piece of money. It is a thick piece of copper, about as broad as a sixpence; twelve of these make a medall there.

BURBIDA, in Ancient Geography, a town of Spain, between Tuda and Turqua. Anton. Itin.

BURBOT, in Ichthyology, the English name of gadus lota, a fish common in the Trent, and some few other of our rivers. It is also known by the appellation of the eelpout. This is nympha lutescens of two or three old Latin writers.

BURCA, among the Turks, the name of the rich covering of the door of the house at Mecca; it is ten feet long, and five wide; and there are several figures and Arabic letters on it, very richly embroidered in gold, on a ground of red and green. This is carried about in their solemn processions, and is often made to float, that the people may touch it.

BURCA, in Ancient Geography, a town of Africa in Mauritania Caftaricae. Ptolemy.

BURCARDIA, in Botany (from J. H. Burckhard, M. D. who published Charac. Plant. 1792), a genus formed by Scopoli, and adopted by Schreber, for a plant described by Aublet in his account of the plants of Guinea, and called by him Piriqueta, which has been referred by Willdenow and Bofe to the genus Turnera. See Turnera nusega.

BURCHAN, or Burchanis, in Ancient Geography, an island placed by Pius between the Rhine and the Cimbric promontory. It was reduced by Darius, who employed for this purpose all the Roman forces in those parts.

BURCHARDIA, in Botany. See Callicarpa Americana.

BURCHAUEN. See Burkhauen.

BURCHEIM. See Burkeim.

BURCHIELLO, in Biography, an Italian poet, whose family name was Domenico, was a native of Florence, where he exercised the trade of a barber, and where his shop was the usual rendezvous of the men of letters in that city. He died at Rome in 1448. His poems, which were a singular kind of burlesque, abounded with licentious expressions, old proverbs, and various extravagances, often unintelligible, and frequently low and indecent, but intermixed with flashes of wit and vivacity, that became very popular, and established a kind of style, called the "Burchellicique," which had several imitators. The pieces of this poet are chiefly sonnets, of which the first edition appeared at Bologna in 1455; and another edition, with a comment, no less hard to be understood than the original, was given at Venice in 1558. The Junta at Florence published all his poems in 1552 and 1558. Whatever amusement performances of this kind might afford in a rude age, and in the infancy of poetry, they have sunk into obscurity by the prevalence of good taste and decorum. Mr. Rococo, in his "Life of Lorenzo de Medici," informs us, that a satire of Burchiello in terza rima, after the manner of Dante, exists in MS. in the library of the duke of Tufany.

BURCKERSDORF, in Geography, a town of Germany, in the circle of Upper Saxon, and territory of Newfriend; 7 miles N.W. of Weyda.

BURCUS, in Ancient Geography, a river of Afiaitic Sarmatia, on the banks of which was built the city of Cucunda, according to Ptolemy.

BURDA, in Geography, a river of Hindostan, which runs into the Godavery, 60 miles E. of Nernmul. Burda,
BURDA, in some Middle Age Writers, denotes a garment made of ruffles.

BURDACK, an Egyptian vessel, which sleep usually drink out of at Cairo. They are made of a peculiar sort of earth, which is supposed to cool the water, and are always fit out to the north, to keep the cooler, and covered with a strainer, to prevent any thing falling into the water; they are of so porous a structure, that the water put into them will get through them in a few days.

BURDAH, in Geography, a town of Africa, near the river Gambia, in the kingdom of Temani.

BURDALO, a river of Spain, in Estremadura de Leon, which rives in the vicinity of Truxillo, and discharges itself into the Guadiana.

BURDEGALA, or BURDEGA, in Ancient Geography, now Bourdeaux, a trading port-town of Gaul, in the second Aquitania, the capital of the Bituriges Vivisci, seated on the Garonna. Saba is the most ancient author who mentions it, and by his description he intimates, that the sea-water formed a marsh in its vicinity. The poet Ausonius leads us to conclude, that the Druids had a school in this city; it was the place of his nativity, and he had been a professor in its school. He has given a poetical description of this city, See Bourdeaux.

BURDEN properly signifies a heavy weight or load. Ringelberg recommends the bearing burdens as the best sort of excercice; especially to strengthen men of study. To this end, he had a gown lined with plates of lead, which he could just lift with both hands. This load he bore six or seven days together, either increasing or diminishing it as he found occasion; by which means he could both write and excercise at the same time.

Burden also denotes a fixed quantity of certain commodities. A burden of gad-fool, is two score, or 120 pounds.

Burden, or Burthen, the weight of a ship when not overloaded to go to sea, and is usually expressed in tons, and sometimes in theft. The common method employed by ship-builders to find the tonnage of a ship, is to multiply the length of the keel by the extreme breadth, and the product by half the extreme breadth; then, this half being divided by 94, the quotient is the burden in tons. If the ship is afloat, and the tonnage required, the length of the keel cannot be ascertained; in this case, therefore, ship-builders use the following rule. From the extreme length subtract three-fifths of the extreme breadth, the remainder is the assumed length of the keel. Now the length of the keel thus found being multiplied by the extreme breadth, and that product by half the breadth, which last product being divided by 94, will give the tonnage for merchants' ships; but for ships of war the divisor is 100.

According to an act as settled by the 13 Geo. III. chap. lxxiv. the burden or tonnage of a ship is to be found as follows. Measure the length from the after part of the main stern-post along the rabbet of the keel to a line perpendicular thereto, from the fore part of the main item under the bowprit; from which subtract three-fifths of the extreme breadth, exclusive of any doubling, and the remainder is to be esteemed the length of the keel for ascertaining the tonnage; which, being multiplied by the breadth and half-breadth, and divided by 94, as formerly, will give the tonnage. When it becomes necessary to ascertain the burden of a ship which is afloat, the following method is to be observed. Measure the nearest distance, at the load water mark, between the after part of the stern-post, and a plum line suspended from the stern; which, deducted from the length measured from the point on the stern where the plum-line was suspended to a point perpendicular above the load water mark at the fore part of the stern, the remainder is the extreme length of the ship; from which subtract two-thirds of the extreme breadth measured from outside to outside of the plank, exclusive of doubling or feathering, and also one-fourth of the depth of the load water line abutt, and the remainder will be the length of the keel for tonnage; which, being multiplied by the breadth, and by the half-breadth, and the product divided by 94, will give the burden in tons.

In Dr. Mackay's treatise on "Navigation," a rule, adapted to logarithms, is given to find the tonnage of a ship; and in his treatise on "the description and use of the fishing rules," is contained the method of ascertaining the tonnage by that means.

From the sighted reflection it will be evident the above-mentioned rules, although functioned by practice and by the legislature, cannot give the true burden of a ship. Neither is the depth taken into the account; and although the length, extreme breadth and depth are taken into consideration, yet the form of the bottom, and the dimensions of the ship at various other parts are neglected; and hence, full built, deep ships will carry considerably more than according to the rule; and sharp built ships will be greatly over-rated. Since, therefore, the several duties on shipping incautely with the tonnage, ships are generally made deeper than their other dimensions require, which has the tendency of making them crank. For a more accurate method of ascertaining the burthen of a ship, see the article Tons.

Burden, ships of, denote those of a larger and heavier load, carrying 500 tons, or upwards.

Burden, or Burthen, from Burden, Fr. a drone. Hence, in Moysa, a bafe of only one note, a pedal, and the drone of a bag-pipe, is called a drone-bafe. And hence, that part of a song which is repeated at the end of every verse or stanza, is called the burden of the song.

"At every close the made, th' attending throng
Replied, and bore the burden of the song." Dryden

Pope writes burthen:

"Sacred to ridicule, his whole life long,
And the sad burden of some merry long."

Burden also denotes the pipe, or string by which such a found is given.

Matth. Paris will have the name burden to have been originally given this pipe, on account of its resemblance to a pilgrim's staff, generally called also burde.

BURDO, in Physiography, a mongrel beast of burden, produced by a horse and a cow, by which it is distinguished from the mule, which is that produced of a male ass by a mare.

Burdo, or Burdon, in Middle Age Writers, denotes a pilgrim's long staff, as doing the office on that occasion of a mule, or other vehicle.

BURDOA, or Burdova, in Ancient Geography, a town of Hispania, in Lusitania. Ptolemy.

BURDOCK, in Botany. See Arctium Lappa, and Xanthium Strumarium.

BURDONA, an appellation sometimes given to pilgrims, or those who went out of devotion to the holy land. The word is formed from Burdo, an appellation given to the staff wherewith they travelled.

BURDUIGNO, in Geography, a small town of the Morea, seated on the Vasilipotamo, between the mouth of this river and the town of Mitira.

BURDWAN, or Burwah, a town of Hindostan, in the country of Bengal, 50 miles N. W. of Calcutta. N. lat. 23° 10'. E. long 84° 30'.

BURE, William-Francis de, in Biography, a bookseller of Paris, eminently skilled in bibliography, published
BUR

BUREBA, in Geography, a country of Spain, in Old Castile, which was formerly a part of Navarre: its principal town is Biviana.

BURDIGAT, El, a town of Egypt, on the west side of the Nile, 10 miles W. of Memphis.

BUREIL, a town of Atlantic Turkey, in the province of Caramania: 10 miles S. of Yerrup.

BURELLE, in Heraldry, is a term used by the French heralds for enframbling bary; as the same as the English call barrier.

BURELLE, or Civitate Borelle, in Geography, a small episcopal town of Naples, in the province of Abruzzo Citra, on the east side of the river Sangro. N. lat. 41° 56'. E. long. 15° 5'.

BUREN, a town of Germany, in the circle of Westphalia, and bishopric of Paderborn, seated on the Alme; 13 miles S. W. of Paderborn. N. lat. 51° 35'. E. long. 8° 25'.

Buren, a town of the United Provinces, in the duchy of Guelders, and capital of a fine corn country, belonging, before the late revolution, to the house of Orange, to which it belonged in 1551, by the marriage of prince William I. with Anne heirels to Maximilian count of Egmond; 5 leagues N. of Dois-le-Duc, and 6 S. E. of Utrecht. Without the town is a good castle, walled and surrounded by a double moat. N. lat. 52°. E. long. 5° 22'.

BUREN, a town of Switzerland, in that district of the canton of Berne, called the Upper Argow, seated on the east side of the Aar, over which it has a bridge; 9 miles S. W. of Soleure. N. lat. 47° 0'. E. long. 7° 11'.

BURETRAS, the name of a village of Sweden, in West Bohemia.

BURETTE, PIERRE-JEAN, in Biography, born at Paris in 1665, was the son of a Leper, who, not being very prosperous in his practice, had recourse for his support to music, which he had learned of his mother, an excellent performer on the harp and harpsichord. He first performed, professionally, at Lyons, and afterwards went to Paris and played on the harp to Louis XIV., who was much pleased with his performance.

His son, Peter-Jean, was so sickly and feeble during infancy, that he passed almost his whole youth in amusing himself on the pipe and in the study of music; but he had so strong a passion for this instrument that he had scarcely arrived at his ninth year when he was heard at court, accompanied by his father on the harp. Two years after, the king heard him again, when he performed a duct with his father on the harp; and at eleven years of age, he assisted him in giving lessons to his scholars.

It is not generally known that the learned academician, Burette, who had written so copiously on the subject of ancient music, was so well acquainted with the modern; which must have rendered his opinions more valid, and given weight to his reasoning on musical subjects in general, which a mere man of letters seldom obtains. His taste for music, however, did not extinguish his passion for other sciences. He taught himself Latin and Greek with little assistance from others; and the fluency of those languages inclin'd him to medical inquiries. At eighteen years old he attended for the first time the public schools, went through a course of philosophy, and took lessons in the schools of medicine. And even during this time he learned Hebrew, Syriac, Arabic, Italian, Spanish, German, and English, sufficiently to understand them in books.

He was at length admitted of the faculty at Paris, and professed with reputation during thirty years, having for his disciples almost all his brethren who have since enjoyed the highest reputation in that capital.

In 1705, he was received into the Academie des Belles Lettres; and in 1706, he had a considerable share in the publication of the "Journal des Savans," at which he laboured more than thirty years. In 1718, he had an appointment in the Bibliothèque du Roi.

The public are obliged to the abbé Fréquier for the learned dissertation which M. Burette produced on the music of the ancients. This learned abbé, supposing that the Greeks applied the same sense to the word harmony, as is given to it by the moderns, and that, consequently, they knew counterpoint, or music in parts, Burette proved that he was mistaken, and that the ancients meant no more by the term harmony, than we do by proportion. He demonstrated that the Greeks professed no other simultaneous consonances than unisons and octaves.

This learned and indefatigable inquirer after the music of the ancient Greeks, was seized, in 1745, with a paralytic affection, and after languishing during the whole year 1746, he died in 1747, at 82. His library, consisting of 15,000 volumes, was composed of the most curious and well-chosen books that could be procured in all languages.

He has supplied the memoirs of the Acad. des Inscriptions et Belles Lettres with dissertations on the dancing of the ancients, on play or gaming, on single combat, and on horseracing. He enriched those memoirs with a translation of Plutarch's treatise on music, with notes and remarks, which are dispersed through many volumes of the memoirs of that learned society. And this writer must be allowed, on every subject concerning ancient music, the merit of great diligence and learning; but he does not seem always to have been possessed of an equal share of tact and ability, or with courage sufficient to confide himself unable to explain inexplicable passages in his author. He never fails a difficulty; he explains all. Hence, amidst great erudition, and knowledge of antiquity, there are a thousand unintelligible explanations in his notes upon Plutarch. "En croyant," said Fontenelle, "j'ai toujours taché de m'entendre."—An admirable rule! which every writer ought to adopt.

Thus much is said, not with a view to depreciate the merit of M. Burette, to whom almost all late writers on music have had great obligations, and whose labours have been of singular service to ourselves, among the rest; but to shew how few authors are to be always followed implicitly, or read without precaution. But though we have frequently differed from him, we have adopted his opinion when we thought it well founded; and there has been no obsequious writer on ancient music, who has not frequently availed himself of his labours.

BURFORD, in Geography, an ancient town of Oxfordshire, in England, is supposed by some writers to be one of the oldest towns of the Mercian kingdom. It is remarkable in the page of history, and in the annals of sporting. Near this town was the scene of that decisive engagement between the West Saxons and Mercians, which delivered the former from the tyranny of the latter. In the year 752, a pitched battle was fought here between Guthred, king of Wessex, and Ethelbald, king of Mercia, "two princes of high spirit and ambitious schemes." The conflict was violent, and the latter monarch was compelled to fly for safety; yet, during the engagement, the banner of Mercia, a golden dragon,
BUR

was feized and torn by Edelhun. The scene of this conflict
is still pointed out by the name of a field a little westward of
the town called Battle-edge; and the memory of the event is
preferred by an annual procession on the eve of Midsummer
day. At the conclusion of the seventeenth century, an ecclesiasti-
cal synod was held here to determine the time when Easter
should be held. It was then decreed that Aldhelm, abbot of
Malmesbury, should announce to the British church a fixed and
proper period for the celebration of this festival in future.

The horse-races of Burford are frequent, and much fre-
quently by the students from Oxford, and the neighbouring
gentry, &c. Here are manufactories for duffels and for
rugs. The town is seated in a low, narrow valley on the
banks of the river Windrush. The high grounds are mostly
appropriated to corn, in consequence of which, the markets at
this place and at Whitney are abundantly supplied with that
necessary article. The church is a spacious and interesting
pile of building; displaying some curious specimens of
ancient ecclesiastical architecture. Its western door is formed
with a semicircular arch, ornamented with birds' heads, &c.
and the south porch displays a highly decorated exterior.

Near this town is an ancient manor-house, which was a
religious foundation belonging to the keynsham in
Somersetshire. This belongs to John Leuthall, esq., a
descendant from the famous speaker to the long parliament.
Burford had a charter from Henry II. and is governed by
two bailiffs, burgesses, &c. It is distant 72 miles N. W.
from London, contains 396 houses, and 1516 inhabitants.

Here are a market on Saturdays, and two annual fairs. Plot's

BURFORD SADDLE. See SADDLE.

BURG. See Borg.

Burg, a bailiwick and castle of Germany, in the circle
of Upper Saxony, and county of Reins; 4 miles S. W. of
Schleitz. — Allo, a town in the circle of Lower Saxony, and
duchy of Magdeburg, seated on the Ilke, in which are
woollen manufactories; 14 miles N. E. of Magdeburg.—
Allo, a town of the United Netherlands, in the county of
Zutphen, seated on the Old Iffel, between Anholt and
Dertikem. N. lat. 51° 30'. E. long. 6° 12'.

Burg or Bork, a town of Germany, in the circle of
Weizelsau, and duchy of Berg, seated on the Wippe; 6
miles S. of Silingen.

Burg-Brunnheim, Mark, a town of Germany, in the circle
of Franconia, and principality of Culmbach; 14
miles N. N. W. of Aspach.

Burg-Langensfeld, a town of Germany, in the circle of
Bavaria, and principality of Neuburg, on the Nab; 15
miles N. of Reutn.

Burg-Scheidingen, an ancient fortified town, but now a
church-village of Germany, in the circle of Thuringen; 3
miles S. E. of Nebrn.

Burg-Schwalbach, a town of Germany, in the circle of
the Upper Rhine, and county of Nassau-Saarbruck, and in
a proprietor of the same name.

BURGH—upon the Rhine, a place lying at a small distance
west of Carlisle, in the county of Cumberland, and remark-
able for the monument erected there in honour of Edward I.,
who died there in 1307, on his return from a successful expe-
dition against the Scots.

BURGAGE, in Law, a tenure proper to boroughs
and towns, whereby the inhabitants hold their lands and ten-
ements of the king, or other lord, at a certain yearly rate.
This tenement is described by Glanvil (l. vii. c. 51.), and is
expressly said by Littleton (§ 162.) to be but tenure in
fogage. It is indeed only a kind of town fogage; as com-
mmon fogage, by which other lands are held, is usually of
a rural nature. A borough (see Borough) is usually dif-
tinguished from other towns by the right of sending
members to parliament; and where the right of election is by burgage
fogage, that alone is a proof of the antiquity of the borough.
Tenure in burgage, therefore, or burgage fogage, is where
houes, or lands which were formerly the feite of houes,
in an ancient borough, are held by some lord in common fogage,
by a certain established rent. The free fogage, in which
these tenements are held, seems to be plainly a remnant
of Saxon liberty; and this may account for the great variety
of customs, affecting many of these tenements so held in
ancient burgage; the principal and most remarkable of
which is that called Borough-English; which fee. There
are also other special customs in different burgage fogages;
as in some, that the wife shall be endowed of all her hus-
band's tenements (Litt. § 166.), and not of the third part
only, as at the common law; and in others, that a man
might dispose of his tenements by will (Litt. § 167.),
which in general was not permitted after the conquest, till the
reign of Henry VIII.; though in the Saxon times it was
allowable. A pregnant proof, says judge Blackstone (Com.
vol. ii. p. 84.), that these liberties of fogage tenure were
fragments of Saxon liberty.

Burgage is sometimes used to denote the rent, or quit-
rent paid to the chief lord for the houes and tenements in
a town or borough.

BURGAGE, see Bergase.

BURGAU, a town and castle in a margraviate of the
same name, in Austrian Swabia, seated on the river Mindel;
5 leagues N. of Augsburg.

BURGAU, a considerable village of Germany, in the circle
of Upper Saxony, and principality of Eilenau; 3 miles S.
of Lena.

BURGADUINE, the name given by the French arti-
cers to what we call mother of pearl. In their works,
they do not use the common name for this, but the
lining of the American beryne. Hence some call the mother
of pearl burgadune, and others the burgadine mother of
pearl.

BURGDORF, in Geography, a town of Swiffland, in
the canton of Berne, and chief place of a bailiwick, seated
on the river Emme; about a league from the town are
fri
gle of fountains and baths, which are said to be beneficial
in paralytic and nervous complaints; 8 miles N. E. of Berne,
and 12 S. S. E. of Soleure. N. lat. 47° 32'. E. long.
7° 46'.

BURGDORF, a town of Germany, in the circle of Lower
Saxony, and principality of Lunenburg-Zell, seated on the
Aue; it is walled and moated, and has a castle; 14 miles
E. N. E. of Hanover, and 9 S. of Zell.

BURGES-LES-BAINS, a town of France, in the de-
partment of the Allier, and chief place of a canton, in the
district
BURG, a district of Moulins. The town contains 2,452, and the canton 12,104 inhabitants; the territory includes 3,474,968 acres, and 13 communes.

BURG-MASTER of Greenland, in Ornithology. See Procellaria Glacialis. The same name is given by Rauw to the vagel gull, Larus maxima; it is also called Burgo- master, and Burgemeister. In Martin's Spitzb. Larus glaucus, the glaucous gull, is termed Burgemeister.

BURGIN, in Geography, a town of Egypt, on the west side of the Nile; 17 miles N. of Achmousan.

BURGEL, a town of Germany, in the circle of Upper Silesia, and margraviate of Meissen, seated on the Saal; 6 miles S. of Dornburg.

BURGEL, Bregel, or Mark-Burgel, a very ancient town of Germany, in the circle of Franconia, and principality of Coburg, seated on a high mountain near the river; 13 miles N. N. W. of Anspach.

BURGE, a small island near the south coast of Newfoundland; 23 leagues N. W. of Miquelon. N. lat. 47° 27'. W. long. 90° 20'.

BURGEN, in Botany, as the term is used by English gardners, is only another name for a gem or bud. The French botanists distinguish three phases of its growth, by three different names. At its first appearance in spring it is an eye, or a bud; about the full size it becomes a bud, buisson, which continues to increase during the autumn; and in the following spring it is a burgon, burgon.

BURGES, an inhabitant of a borough or a walled town, or one who possesses a tenement therein. In other countries, burgesses and citizens are confounded together; but with us they are distinguished. Stat. 5 R. II. c. 4. See Borough. The word is also applied to the magistrates of corporate towns.

Anciently, burgesses were held in great contempt, being reputed servile, base, and unfit for war; so that the gentry were not allowed to intermarry in their families, or fight with them; but in lieu thereof, were to appoint champions. A burgess's son was reputed of age when he could distinctly count money, measure cloth, &c. Spelm. Gloss. Glanvil. lb. vii. cap. 9.

BURGES, king's, Burgesi rigis, was he who, though residing in another's jurisdiction, was exempt therefrom, and only subject to the jurisdiction of the king, unless the lord also enjoyed royal jurisdiction.

In statute 5 Rich. II. c. 4. where the several classes of persons in the commonwealth are enumerated, we meet with count, baron, banneret, esquire of county, esquire of city, and burgess de burgh.

BURGESS is now ordinarily used for the representative of a borough town in parliament. See Borough.

Burgesses are supposed to represent the mercantile part or trading interest of the nation. They were formerly allowed, by a statute established in the reign of Edw. III. two shillings a day as wages. It is much to be regretted, that the members for boroughs bear above a quadruple proportion to those for counties. The Universities were, in general, not empowered to send burgesses to parliament; though once, in 12 Edw. I., when a parliament was summoned to consider of the king's right to Scotland, writs were issued, requiring the University of Oxford to send up four or five, and that of Cambridge two or three, of their most clever and learned lawyers for that purpose. But king James I. indulged them with the permanent privilege of sending constantly two of their own body, to serve for those students, who, though useful members of the community were neither concerned in the landed nor the trading interest; and to protect in the legislature the rights of the republic of letters. The right of election of burgesses depends on several local charters and customs, which have occasioned infinite disputes; though, by 2 Geo. II. c. 24, the right, for the future, shall be allowed according to the last determination of the house of commons concerning it; and by 3 Geo. III. c. 15, no freeman, except such as claim by birth, servitude, or marriage, shall be entitled to vote, unless he hath been admitted to his freedom twelve calendar months before. No person is eligible as a burgess, who hath not a clear estate of 300l. a year.

BURG, in German, a town of Germany, in the circle of the Upper Rhine, and principality of Upper Hesse; 14 miles S. E. of Mainburg.

BURGGRAVE, properly denotes the hereditary governor of a castle, or fortified town, chiefly in Germany. The word is compounded of burg, town, and graf, or grave, count.

The burggravies were originally the same with what we otherwise call castellane, or comes castellani; but their dignity was considerably advanced under Rudolph of Hapsburg; before this time they were ranked only as counts, and below the princes, but under him began to be exalted on a footing with princes. In some parts the dignity is much degenerated, especially in the Palatinate. There were formerly, according to Leti, fifteen families who enjoyed the title of burggravies, thirteen of which are now extinct. But this is differently represented by others. In Bohemia, the title burggrave is given to the chief officer, or to him that commands in quality of vicerey. In Prussia, the burggrave is one of the four chief officers of the province. In Guelders, the burggrave of Ninigen is president of the states of the province.

BURGROVE, JOHN PHILIP, M. D. in Biography, practiced physic several years, first at Darmstadt, and afterwards at Frankfort, and was author of several interesting works. 'Libitio omnis Fatis Hygiea, fum de Medicis Artis que ac Medicorum principibus Fatis,' Frank. 1701, 8vo.; in which he recounts the principal occurrences in the lives of the most celebrated physicians from the time of Hippocrates. This was again printed in the year 1706, with some alterations, under the title of 'Latriae Hominum Lethique Curiosis. De Exilientia Spirituum nervorum, corumque origine, Indole, Motu, Effectibus, &c. in Corpore Humano vivo,' &c. 1725, 4to. Dr. Goelicke wrote an answer to this under the title of 'Spiritus Animalis ex Foro Medico relegatus,' which produced, from our author, 'Spiritus Nervorum refutatus;' 1729; to this unmeaning controversy ended. His next work, which gave him much credit with his countrymen, was, 'De Aere, Aquis, et Locis Urbis Francocuriae Commentatio,' 1751. 8vo. He also published an edition of 'Hermes Conringsius, de Habitus Corporum Germanicorum Antiqui et Novi Causi,' with a commentary, 17, 7, 8vo. See Play. Dict. Hist.

BURGH, JAMES, an esteemed moral and political writer, was born in 1715, at Madley, in Herefordshire, and educated at the University of St. Andrews, with a view to the ministry, which was his father's profession; but, obliged to decline it on account of his health, he embarked in the linen business, and lost his whole property. This misfortune reduced him to the necessity of seeking a livelihood in London, where he was first employed in correcting the press and making indexes, and afterwards as usher in a school. Whilst he occupied this situation at Great Marlow, in the county of Bucks, he published without his name, in 1745, a pamphlet entitled, 'Britain's Remembrancer,' which passed through five editions. In 1747 he became master of an academy, which he removed from Stoke-Newington to New-
ingston-green, and which he supported with great reputation to himself and benefit to his scholars for 19 years. Independently of the attention which he devoted to his school, he composed and published several valuable works; of which the principal appeared in 1754, under the title of "The Dignity of Human Nature; or a Brief Account of the certain and established Means for attaining the true End of our Existence," 4to. reprinted in 2 vols. Svo. In 1762 he published "The Art of Speaking," containing rules for elocution, and lessons selected from ancient and modern writers, in which the emphatical words were distinguished by Italics. The first volume of his "Crito, or Effays on various Subjects, political, moral, and metaphysical," was published in 1766, and a second volume in 1767. In discussing the question concerning the origin of evil, he ascribes it to the machinations of powerful malignant spiritual beings, from which Christianity was designed to deliver us. In 1771 he gave up the charge of his school, and, though he suffered excruciating pain from the fluke, pursued with great vigour of mind the composition of a work, for which he had collected a mass of materials, entitled "Political Disquisitions." The first two volumes of this work, comprehending a vast variety of political subjects, appeared in 1774; and the third in 1775; and they were well received by those who were zealous in the cause of public reform. Whilst he was prosecuting this work, the painful disease, which he had long sustained with patience and resignation, terminated his life in 1775. Those who were in habits of intimate acquaintance and frequent intercourse with him, highly esteemed him for his piety and integrity, his social cheerful temper, and the benevolent ardour with which he devoted himself to the promotion of the public good. If he was fuggine in his projects, they were such as tended, according to his judgment, to the general improvement of society and of mankind: and though his compositions are distinguished more by the variety of their subjects than by accurate arrangement, and by energy rather than eloquence of language, many of them will be read with satisfaction and advantage. Besides the treatises already mentioned, he published, at different times, "Thoughts on Education," "An Hymn to the Creator of the World," "A Warning to Dram-drinkers," 18mo. written at the request of Dr. Stephen Hales, and Dr. Hatter, bishop of Norwich; "Directions, Prudential, Moral, Religious, and Scientific," printed for the use of his scholars, and since pirated by book-sellers, and sold under the title of "Youth's friendly Monitor;" and several periodical essays on the topics of the times, in the news-papers. Biol. Brit.

BUR, the name by which a town or city is called.

BURGH, the name by which a town or city is called.

BURGH-bay, from burg, castellum, and bote, compenstatio, is chiefly used for an aid or contribution levied for the repairing of a town or city.

BURGH-bye, or by, a fine imposed on the community of a town, or burg, for the breach of peace among them.

BURGH-mail, were yearly payments to the crown of Scotland, introduced by Malcolm III, and resembling the serfdom rents of burghs in England. See Mail.

BURGH-master, an officer in the tin mines, who directs and lays out the meers for the workmen, &c. otherwise denominated bailiff and master, which see.

BURGH and buoy, in Sea Language, lies on the coast of Holland, W. by S. from the beacon on Vooget land. On the Texel island are four churches, of which Burgh is the most northerly, except Oogh, which has no steeple.

BURGHAUN, or BURGHAUN, in Geography, a small town and citadel of Germany, in a bailiwick of the same name, in the circle of the Upper Rhine, and bishopric of Fulda, seated on the river Haun, and having two churches, one for the Lutherans, and another for the Catholics; 8 miles N. N. E. of Fulda.

BURGHERMSTERS, BURGERMSTERS, BURG;
esters, or BURGOMSTERS, chief magistrates in the cities of Germany, Holland, and Flanders; to whom belong the giving of orders for the government, administration of justice, policy, and finances of the place: though the authority and office are not everywhere alike; each city having its particular laws and statutes.

The word is formed from the two Flemish words, borger, burgef, or citizen; and mafter, master. Some express it in Latin by confultatus, others by senator. M. Bruce observes, that burhgermush, in Holland, answers to what is called alderman and sheriff in England; attorney at Compeigne; capitaulus at Tholoue; confultus at Languedoc, &c.

BURGHLINE, a borough-town, or court held for a town or borough. See Court and Mot.

The word is also written burgemuster, burghinotus, burgemaker, and burgemote, from burgh, episcopus; and man or geme, conventus.

The burghmote, by the laws of king Edgar, was to hold thrice in the year; by those of Henry I. twelve times. Burghmote is different from burghnotus, derived from berg, a hill, and moate, assembly, which denotes an assembly or court upon a hill, and is held in Derbyshire for deciding pleas and controversies among the miners.

BURGEONES, in Ancient Geography, the name of the people placed by Ptolemy in European Sarmaetia.

BURGLARY, in Law, or natural heafe-breaking, burgilatrocinium, called by our ancient law, and now in Scotland homofecen, an unlawful entering into another man's dwelling, wherein some person is, or into a church in the night-time; in order to commit some felony, or to kill some person, or to steal something thence, or do some other malicious act; whether the same be executed, or not. This crime has been always regarded as very heinous; partly on account of the terror which it occasions, and partly because it is a forcible invasion and disturbance of that right of habitation, which every individual might require even in a state of nature, and against which the laws of civil society have particularly guarded. Where they allow the posseffor to kill the aggressor, who attempts to break into a house in the night-time, they also protect and avenge him, in case the assailant should be too powerful. Such regard, indeed, has the law of England to the immunity of a man's house, that it flies its call, and will never suffer it to be violated with impunity; agreeing in this respect with the sentiments of ancient Rome, as expressed in the words of Tully (Pro Domino, 41) "quid enim facitius, quid omnibus reginum munus, quam domus seu convivium?" For this reason no outward doors can in general be broken open to execute any civil process; though, in criminal cases, the public safety supercedes the private. See ARREST. Hence, also, in part, arises the animation of the law upon careless-drifters, nuisancers, and incendiaries; and to this principle it must be affixed, that a man may assemble people together lawfully (at least if they do not ex-
cased (eleven) without danger of raising a riot, rout, or unlawful assembly, in order to protect and defend his house; which he is not permitted to do in any other case. 1 Hal. P. C. 54.

The definition of a burglar, as given by Sir Edward Coke (3 Inst. 61) is, "he that by night breaks and enters a man's house, with intent to commit a felony." In this definition, says Judge Blackstone (Comment. vol. iv. p. 22), there are four things to be considered; the time, the place, the winder, and the intent.

1. The time must be by night, and not by day; for in the day-time there is no burglary. In considering what is reckoned night, the day was ancienly accounted to begin at lun-rising and to end immediately upon sun-set: but the better opinion seems to be, that if there be daylight or twilight sufficient, begun or left, for discerning a man's face, it is no burglary. 3 Inst. 63. 1 Hal. P. C. 559. 2 Hawk. P. C. 101. But this does not extend to moonlight: for then many midnight burglaries would go unpunished; and besides, the malignity of the offence does not so properly arise from its being done in the dark, as at the dead of night; when the whole creation, except beams of prayer, is at rest; when sleep has disarmed the owner, and renders his house defenceless.

2. It is the place. It must be by the definition a manion-house; and, therefore, in order to account for the reason why breaking open a church is burglary, as it undoubtedly is, Sir Edward Coke quaintly observes, that it is "domus manionalis Dei." But it is not necessary that it should in all cases be a manion-house: for it may be committed by breaking the gates or walls of a town in the night. Accordingly Spelman defines burglary to be "Nocturna dumptio aliquius habitaculis, vel ecclesiis, etiam murorum portarumve burgi, ad feloniam perpetrandam." No distant barn, warehouse, or the like, has the fame privileges as a manion or dwelling-house, nor is regarded as a man's castle of defence: nor is a breaking open of houses in which no man resides, and which, therefore, for the time being are not manion-houses, attended with the same circumstances of midnight terror. A house, however, in which a man sometimes resides, and which the owner hath only left for a short season, animo revendenti, is the object of a burglary, though no one be in it at the time when the fact is committed. 1 Hal. P. C. 566. Foll. 77. If a barn, stable, or warehouse be parcel of the manion-house, and within the same common fence, though not under the same roof, or contiguous, a burglary may be committed in it; for the capital house protects and privileges all its branches and appurtenances, if within the curtilage or homestead. 1 Hal. P. C. 558. 1 Hawk. P. C. 104. A chamber in a college or an inn of court, where each inhabitant has a distinct property, is, to all other purposes as well as to this, the manion-house of the owner. 1 Hal. P. C. 556. A room, or lodging, in any private house, is also the manion for the time being of the lodger; if the owner doth not himself dwell in the house, or if he and the lodger enter by different outward doors. But, if the owner himself lies in the house, and hath only one outward door at which he and his lodger enter, such lodgers seem only to be innates, and all their apartments to be parcel of the one dwelling-house of the owner. 4 Eliz. 84. 1 Hal. P. C. 558. Thus also the house of a corporation, inhabited in separate apartments by the officers of the body corporate, is the manion-house of the corporation, and not of the respective officers. Fossor, 38. 39. If I hire a shop, parcel of another man's house, and work or trade in it, but never lie there, it is no dwelling-house, nor can burglary be committed in it; but if I or my servant, usually or often lodge in the shop at night, it then becomes a manion-house and the object of burglary. If the shop-keeper sleep in any part of the building, however distinct that part is from the shop, it may be alleged to be his manion-house; provided the owner does not sleep under the same roof also. Lecenh's Hawk. P. C. 1. c. 35. § 156. By 13 Geo. III. c. 38. burglary in the workshops of the plate glass manufacture, with intent to steal the stock or utensils, is declared to be a single felony, and punished with transportation for seven years. No burglary can be committed in a tent or booth, erected in a market or fair, though the owner may lodge in it. 1 Hawk. P. C. 104; but by Stat. 5 and 6 Ed. VI. c. 9, clergy is taken from this offence.

3. As to the manner of committing burglary; there must be both a breaking and an entry to complete this offence. But they need not be done at once: for, if a hole be broken one night, and the same breakers enter the next night through the same, they are burglars. 1 Hal. P. C. 551. There must in general be an actual breaking, so that it may be regarded as a substantial and forcible irruption. Such are breaking, or taking out the glass of, or otherwise opening, a window, and taking out goods; picking a lock, or opening it with a key; and lifting up the latch of a door, or looting any other falsehoods which the owner has provided. But if a person leaves his doors or windows of his house open, and a man enters by them, or with a hook or by any other means draws out some of the goods of the owner, it is no burglary; but if, having entered, he afterwards unlocks an inner or chamber door, or if he comes down a chimney, he is deemed a burglar. If a person enters by the open door of a house, and breaks open a chest and steals goods, this is no burglary by the common law, because the chest is no part of the house; though this is felony out of the clergy by Stat. 3 W. and M. c. 9; but if one break open a cup-board or counter, fixed to a house, it is burglary. 1 Hal. P. C. 552; 553. 1 Hawk. P. C. 103. So also to knock at the door, and upon its being open to run in with a felonious intent; or under pretence of taking lodgings, to fall upon the landlord and rob him; or to procure a confable to gain admittance, in order to search for traitors, and then to bind the confable and rob the house; are all deemed burglary actis, aggravated by the evasions that attend any of them. 1 Hawk. P. C. 102. And also, if a servant opens and enters his master's chamber-door with a felonious design; or if any other person lodging in the same house, or in a public inn, opens and enters another's door with such evil intent; it is burglary. Nay, if a servant complices with a robber, and lets him into the house by night, this is burglary in both (Stra. 881. 1 Hal. P. C. 553. 1 Hawk. P. C. 103); for the servant is doing an unlawful act, and the opportunity afforded him of doing it with greater ease rather aggravates than extenuates the guilt. As for the entry, any the least degree of it, with any part of the body, or with an instrument held in the hand, is sufficient; as, to step over the threshold, to put a hand or a hook in at a window to draw out goods, or a pistol to demand one's money, are all of them burglary entries. 1 Hal. P. C. 555. 1 Hawk. P. C. 103. Foll. 108. When several come with a design to commit burglary, and one does it while the rest watch near the house, the act of one is, by interpretation, the act of all of them. The entry may be before the breaking as well as after; for by Statute 12 Ann. c. 7, if a person enters into the dwelling house of another, without breaking in, either by day or by night, with intent to commit felony, or being in such house, shall commit any felony; and shall in the right
BURGO, near the town of Olina; 40 miles S.E. of Burgos.

BURGO SAND, lies on the ladboard side of the channel at the entrance into Liverpool, which fez. 

BURGOMASTER of Greenland, in Ornithology. See Bursg-mayor.

BURGOO, or Burgout, a fea-faring dish, made of whole oatmeal, or groats, boiled in water, till they burst; then mixed with butter. It is made in Scotland and in Wales, by mixing oatmeal and water, and boiling it into a moderate confluence. It is a cheap and strengthening diet.

BURGOES, in Geography, a large old city of Spain, the capital of Old Castile; and of a province of the same name, forming a kind of semicircle round a hill, on which is a castle, and extending itself along the plain to the small rapid river of Arlanzon, or Anm, over which it has a bridge, and along the bank of which is a handsome paved walk. It is the see of an archbishop, erected in 1554. This city is irregular, most of its streets being narrow and crooked, and its houses high. It has, however, many fine squares adorned with fountains and statues, public buildings, and noblemen's houses; and presents, at a distance, by its numerous tleples and edifices, and particularly the episcopal palace, situate without the town, a pleasing view. The cathedral is one of the most beautiful and bell preferred Gothic structures in Spain; and the chapel, belonging to the convent of the Augustines, is magnificent, and famous for its crucifix, to which extraordinary devotion is paid. Bega, one of its suburbs, has many convents and hospitals; and, among others, a very large one for pilgrims. One of the nunneries is confid to contain 150 nuns, most of them being of noble extraction; and the royal hospital is richly endowed. This city was built in the 9th or 10th century, on the ruins of the ancient Acua. Its situation, as it is surrounded by mountains, renders the air extremely cold for nine months in the year, and for the other three months very hot. The inhabitants of Burgos are said to speak the bell Castillian, or purest Spanish, of any in the kingdom. N. lat. 42° 14'; W. long. 3° 42'.

BURGSTADT, or Burgstadel, a small town of Germany, in the circle of Upper Saxony, and lordship of Schonberg, in which are some tuff-manufactures; 3 miles E. of Pena.

BURGSTALL, a town of Germany, in the archduchy of Austria, situated on the river Erphal; 12 miles S.E. of Ips.

BURGUETTA, or Burguetta, a town of Spain, in Navarre, situate in the valley of Ronceval, where the rear-guard of Charlemagne, on his return to Spain, was defeated by the Saracens, and Roland, his nephew, slain, in the year 778; 8 leagues E.N.E. of Pampeluna.

BURGUI, a town of Spain, in Navarre, situated on the Ebro.

BURGUILLER, a town of Spain in Andalusia, 3 leagues from Seville.

BURGUNDIAN Cross, in Heraldry. Knights of this order were instituted on St. Mary Magdalen's day, in 1535.
by Charles V., emperor of Germany and king of Spain, after he had restored Mulassus, king of Tunis, who was driven out of his kingdom by the noted pirate Barbarossa. The emperor being desirous to gain the love of all those who had valiantly professed themselves in that war, did, as a reward for their services, confer on them this honour of knighthood, on the day he made his public entrance into Tunis; having on the coat he wore in battle, embroidered with a Burgundian crest, to which was added a field bearing spears of fire out of a tent, with this inscription, BARBARIA, which badge was pendant from a gold collar.

BURGUNDIANS, BURGUNDIANS, in History, were a warlike and numerous people, who, upon the decline of the Roman empire, obtained a permanent seat and dominion in the provinces of Gaul. According to Ammianus Marcellinus (I. 28.), and Orosius (I. 7. c. 16.), they were originally descended from the Romans. The latter writer says, that Deutus, Nero, and his brother Tibrius, the adopted sons of Caesar Augustus, having subdued the interior parts of Germany, left several camps in the country, and part of their army to keep the neighbouring people in subjection: from the Roman soldiers, who were on this occasion left to guard the Roman camps, are descended the Burgundians. The castles and strong holds, built for the defence of a country, are called by the Germans "burgt"; and hence the Romans, who guarded them, and their descendants, were named "Burgundians." As they embraced the Catholic faith, the ecclesiastics, whose spiritual jurisdiction they acknowledged, have defended them as mild and tractable in their disposition; for in the countries where they settled, they treated the natives, not as strangers whom they had subdued, but as Christian brethren. Pliny the elder (I. iv. c. 15.) supposes them to be a German nation, descended from the Vandals, supposing to be the same people with the Vandals. Valerius (Rem. Franc. p. 48.) distinguishes the Burgundians of Germany from those of the same name, who dwelt more to the east, on the banks of the Danube. The Burgundians of Germany were sometimes in alliance, and sometimes at war, with the empire; and they are represented by contemporary writers as inferior in bravery to the other Germans, and as dwelling in castles and fortified places, whereas the other German nations fenced any fence besides their arms. See Socrat. Hist. Eclef. I. vii. c. 30. Most of them were mechanics, and, before they settled in Gaul, reftored in great numbers to that country, to earn a livelihood by their respective professions. As to their form of government, they were divided into several tribes, each of which had its respective chief or king, whose authority was so far from being hereditary, that it was not continued during life. If the events of the war acceded the courage or conduct of the king or general, called "Hendinos," he was immediately deposed; and the injustice of his subjects made him responsible for the fertility of the earth, for the regularity of the seasons, which seemed to fall more properly within the Laudatal department. The perfom of the priest, denominated "Sinitus," was sacred, and his dignity perpetual. The kings of the Burgundians did not think themselves degraded by serving in the Roman armies, by executing some of the chief offices of the empire, and by receiving, from the emperors, such dignities as they usually conferred upon their subjects. To the Burgundians is ascribed the first introduction into Gaul of legal duels, or duels ordered by the magistrates or judges, estabfihed in order to discover, from the event, the truth of contended facts. Gundebald is said to have been the first who estabfished by law this maxim, that the best champion is the best man, and ought to be believed; a maxim, indeed, which has often proved fatal to innocence. This unjust and fanguinary law was formally inflicted at Lyons, the 27th of June, A.D. 501, being the 5th of November, A.D. 275, the first of the emperor Titiocitus's reign, when, in conjunction with other barbarians, they crossed the Rhine, overran all Gaul, and made themselves masters of more than 70 cities in that country. But they were soon after defeated, and compelled to sue for peace, by Probus, the successor of Tacitus. In 287 they made another irruption into Gaul, together with the Alamanni; but were defeated by Maximian. See Alemanni. In the year 370, the 7th of Valentian I., an army of 80,000 Burgundians appeared on the banks of the Rhine, impatiently expecting the support and subsidies promised by Valentian; but after long and fruitless expectation, they were compelled to retire. In the year 407, they followed the Vandals, Sueves, and Alans, who had entered Gaul the last day of the preceding year, in order to take part in the spoils of the wealthy province; but they did not settle in that country till the year 413, when, as it is said, they obtained that part of Gaul which borders on the Rhine, or the present Alsace, and the remaining part of Germany Pruna, which were ceded to them by Honorius. Thus commenced the kingdom of the Burgundians in Gaul, under Gundichor their first king. They afterwards, viz. in 435, in conjunction with the Huns, the Huns, and the Franks, entered Belgic Gaul, committing dreadful ravages wherever they came; though, upon their first settling in Gaul, they had promised to afford the Romans, and ferve in their armies as subjects of the empire. Aetius, having defeated their army, reduced them to the necessity of suing for peace, which, however, was of no long continuance. About this time they embraced Chriftianity. Having continued on the banks of the Rhine till the year 438, they were removed by Aetius to the present duky of Savoy. During their residence here, they made themselves masters of several cities and places in Gaul; such as Lyons, Die, Vienne, Auvergne, &c. Before the year 490, the Burgundians were masters of the whole of Lugdunensis Prima, styled by Sidonius Germania Lugdunensis; and in the years 514 and 516, it appears, from the acts of the councils of Agde and Epana, that they were masters of above 26 cities; and, among others, of Lyons, Vienne, Béziers, and Embrun. In the year 490, Gundobald, or Gondebaud, conducted them into Italy, where they committed unparalleled ravages in Liguria. At this time the kingdom of the Burgundians was defined by the course of the rivers Saone and Rhone, and extended from the forest of Volfes to the Alps and the sea of Marcellus. Gondebaud, who died in 509, was succeeded by his son Sigismund, who dispatched an account of his accession to the emperor Anastasius at Constantinople, and acknowledged himself a subject of the empire. Sigismund, by the inhuman affalliation of his son Sigeric, though he has acquired the honours of a saint and martyr, greatly irritated the Oltrogoths and their king Theodore, and occasioned a war between the Franks and Burgundians. In a battle that took place A.D. 523, Sigismund was defeated and taken prisoner; and afterwards put to death, being buried alive in a deep well at Orleans; and the greater part of the country submitted to the Franks. The Burgundians, however, foon revolted, and proclaimed Gondemar, brother of Sigismund, their king, who, after a fierce conflict with the Franks, concluded a peace with them, on condition that they should restore to him all the countries which they had seized during the war. This peace lasted 8 years; but in 532 a war broke out between these two nations; and Childerich and Clotharius, entering the
the territories of the Burgundians, laid siege to Augstodunum, now Autumn, and obliged Gundemar to save himself by flight, and made themselves masters of his kingdom, which agreed to serve in their wars, and to pay them an annual tribute. But they continued, by agreement with their conquerors, to be governed by their own laws; till the reign of Louis-le-Debonnaire. Anc. Hist. vol. 17. Gibbon's Hist. Decl. and Fall of the Roman Empire, vol. iv. v. vi.

BURGUNDIANs, the denomination of a political party, which, together with the Armagnacs, divided the whole kingdom of France, about the commencement of the 15th century. See ARMAGNAC.

BURGUNDY, in Geography, derives its name from the Burgundians (see the preceding article), and, before the revolution, was a very considerable province of France; bounded on the east by Franche-Comté, on the south by Lyonnais, on the west by Bourbonnais and Nivernais, and on the north by Champagne. The government or province of Burgundy contained, besides the duchy of the same name, La Bresse, of which Le Bugey and Le Valromey form a part, and the county of Gex. Its extent from north to south is about 60 French leagues, and from west to east about 30 leagues. Burgundy is divided lengthways by a chain of mountains, extending from Dijon to Lyons; the eastern part of the province is an immense rich plain, which terminates in the mountains of Franche-Comté and Savoy, and which is watered by the Saone and other rivers that flow into it; the other part of the province is mountainous, and in many places dry and uncultivated. The principal rivers that water it, besides the Saone, are the Seine, the Armançon, the Yonne, the Serain, the Ouche, the Doue, which runs into the Saone near Verdun, the Arroux, the Bourbonnais, the Rhone, the Loire, and the Doubs. The mineral waters of this duchy are those of Apoigni near Seignelay, Premean near Nuits, Vevey, Sainte-Reine, and Bourbon-l'Antic. The province is fertile in various kinds of grain and fruit, tobacco, hemp, and flax; and among its wines, which are excellent, we may reckon those of Nuits, Beaune, Dijon, Vollenay, Pomard, Chassagne, Meursault, Volnay, Savigné, Mercé, Chambolle, Givi, Mercurey, Romanée, la Tache, Richemouls, Saint-Georges, and Chambertin. The mountains furnish excellent pastures for cattle and horeses. Its mines afford ores of various metals, particularly iron, different sorts of stones, marble, granite, and also coal, and ochre for dyeing. Its forests supply abundance of wood. It has also various manufactures of iron, wool, linen, and cotton. Its corn, wine, iron, wood, wool, and cattle, furnish the principal articles of commerce. The district of Bresse has subterraneous lakes; and the cave of Arcy, as well as the salt springs of Vezelay, are worthy of notice. The principal towns of Burgundy are Dijon, the capital, Beaune, Châtillon-sur-Seine, Auxerre, Autun, Chalon, Maçon, Bourg, Belley, Gex, &c. Since the revolution, Burgundy is distributed into the departments of the Yonne, Côte d'Or, the Saone and Loire, and the Ain.

The ancient kingdom of Burgundy formed three provinces in the 6th and 12th centuries. The first was that of Provence, which some authors have called the kingdom of Burgundy Cis-Jurana, in reference to mount Jura, now called Mont St. Clair. This was established in 855, in favour of Charles, third son of the emperor Lothario I., and comprehended Provence, properly so called; i.e. the country contained between the Durance, the Alps, the Mediterranean, and the Rhone, together with the duchy of Lyons. The second was formed in 888 on the other side of mount Jura, and called Burgundy Trans-Jurana. It comprehended little besides Switzerland, the Valais, the Genevieve and Chalais. The third kingdom was that of Arles, founded in 930, by the re-union of the kingdoms of Provence and Burgundy Trans-Jurana, in favour of Rudolphus II., who was before king of Burgundy Trans-Jurana only. The kings of France possessed themselves successively of this state: but the duchy of Burgundy, part of the late government of Burgundy, was never comprehended within the kingdom of Burgundy Cis-Jurana, or in that of Burgundy Trans-Jurana. It formed a distinct state, which continued subject to the kings of France. In the partition which took place in 843 between the sons of Louis-le-Debonnaire, Charles-le-Chauve had the part of the kingdom which was situated to the west of the Saone; and it was governed by dukes. But the power of these dukes gradually advanced to such a height, that one of them, named Rudolphus, in the time of Charles the Simple, was elected king of France. This duchy passed afterwards to Hugh the Great, duke of France, who proved a troublesome neighbour to Rudolph; and his son, Hugh Capet, feasted himself and family on the throne of France. His son and successor, Robert, having inherited Burgundy, gave it to Henry, his eldest son, who succeeding to the throne of France, affixed it in 1312 to Robert I., his younger son, who was the head of the first ducal race of Burgundy. This subsisted for 330 years, and became extinct in 1361 in the person of Philip II., who died without issue. King John, being son to a princess of Burgundy, in 1361 united this duchy with the crown, and in 1365 conferred it on his son Philip the Bold, in whom the second ducal line commenced. With his grand son Charles the Warlike, who left his life before Nancy in 1477, the second line terminated. Although he left a daughter, Mary, who married Maximilian, archduke of Austria, and John, prince of Burgundy, count of Nevers and Rethel, who did not die till 1491; Lewis XI. feigned upon the duchy, and united it to his crown, which has since retained it, notwithstanding the repeated claims and endeavours of the house of Austria to recover it. The various possessions of the dukedom of Burgundy rendered them the most considerable power in Europe; and in 1433 a decree of Bayle aigned to Philip the Good the first rank after kings, and named him the first duke of the Christian world. The dukedoms of Burgundy were thefirst ancient peers of France. At the king's coronation they bore the crown, and ground on him the sword.

BURGUNDY, circle of, a circle of the German empire, made a part of it in 1512 under the emperor Maximilian. It took its name from the province of Burgundy, now dismembered from the empire, and belonging to France, and has long since ceased to be reckoned among the circles of the empire. It was formerly under the directorship and sovereignty of the king of Spain, and comprehended not only Higher Burgundy, or Franche Comté, but likewise the 17 provinces of the Low Countries, which in the reign of Charles V. were received as members of the empire.

BURGUNDY Pitch, see Pitch.

BURGUNDY Pitch, platter of. See Plaster.

BURGWARD, Burgwardus, or Burgwardinum, in Middle Age Writers, the same with Dulware. The name is also extended to the town, and even the country about such a fortess. It is formed from the Teutonic burg, town, and wards, enclozy, keeping.

BURHANPOUR, in Geography, a city of Hindostan, and capital of the Candeif confucry, and at one period, of the Deccan also. It is a fine flourishing city, and is situated in the midle of a delightful country. This was one of the earliest conquests in the Deccan; and it is now in the hands of the Poonah, or western Mahrattas. About 20 miles to
the B. of it is a very strong fortres, named Aeer, or Afeagur. It has a considerable trade in fine cloths, white and painted, plain, and mixed with gold and silver, for veils, shawls, handkerchiefs, &c.; 135 miles N. of Aurungabad, and 625 S. of Delhi. N. lat. 21° 19'. E. long. 76° 22'.

Bihar, a town of Hindostan, in the county of Bengal; 12 miles S. of Moorshedabad, and 100 miles N. of Calcutta.

BURIAL, a river of Hindostan, which runs into the Jumna, 20 miles S. of Delhi.

BURIAL. The act of interring a deceased person.

Of the various modes of burial which have prevailed in the world, it was Cicero's opinion, (De Leg. ii. 22.) that inhumation was the oldest: and the records of history undoubtedly corroborate the notion. **Burning**, and including the remains in urns, were perhaps never found expedient, till national animosities had given rise to inhuman treatment of the dead.

The common custom of mankind, from the beginning of time to the present moment, has concurred in the propriety and decency of interment: it is a natural act inspired by humanity; a practice, which has been continually observed by enemies in time of war; and but rarely denied in any country, but to those who have violated either the laws of God or nature. The duty of sepulture, and instances of the discharge of it, constantly occur in Scripture. David paffes high encomiums on the men of Jabez-Gilead who reftored the bones of their king and prince from the enemys walls, and committed them to their family vault. (2 Sam. ii. 5.) It is part of the office of Tobit that he went about burying his murdered countrymen, at the hazard of his life. And Jeremiah threatens it as the greatest of punishments, that the wicked should be deprived of burial, and left on a dunghill: (Jer. viii. 2.) or as it is emphatically expressed, buried with the burial of an afa. Herodotus tells us, (Euterpe. xc.) that in Egypt, if either a native or a foreigner was found either destroyed by a crocodile, or drowned in the water, the city near which the body was discovered was obliged to embalm it, and pay it every respectful attention, and afterwards deposit it in some consecrated place. Iheus brings it as a proof that Clean was not the son of Aphilyphus, because he neither buried him, nor performed his funeral exequies. (Orat. de Hereditate Aphilyphi.) A law of Athens compelled the burial of a dead body found by accident, and pronounced the refuser impious. Servius on Virgil (AEn. vi. 176. f.) says, writers on moral duties place the duty of interring the dead among the first. It was profession for a priest to look on a dead body, but the height of impolicy to leave it unburied. The Athenians carried their attention to the dead beyond the grave; and Solon, by an express law, forbade any reflections on their character. On this law Plutarch thus comments: "Piety should induce us to reverence the dead; justice should prevent us from meddling with the affairs of those who no longer exist; and policy should lead us to prevent the perpetuity of enmity." (Solon. p. 89. E.) Demodithes extends the caution still further: not even any provocation from survivors of the family should urge us to any reflections on the dead; (In Leptomein, p. 298.) and every citizen was at liberty to bring an action against the abusive party. (Ulpian in loc. Demodithes in Bacotos. p. 588. Susdas.) The Cynics, however, seem to have regarded burial with contempt; and Plato (H. N. i. vii.) ranks concern about it amongst the weaknesses pecu- liar to man.

Among the earliest inhabitants of the world, neither the mode nor the appropriate place of burial can now be ascertained. Nor does it seem that the latter, even in the middle periods of Jewish history, was always particularly determined. For we find they had graves and sepulchres both in the town and country; in fields, upon the highways, in gardens, in their own houses, and upon mountains; though the general custom seems to have been, that the dead should be interred without the city. They appear in many cases also to have thought it a misfortune not to be buried with their fathers. In Genesis (xxv. 5.) when the affliction of Abraham's poverty was foretold, it was promised that he should go to his fathers in peace, and be buried in a good old age. He afterwards pleads most pathetically with the sons of Heth (xxi. 3.—13) for the purchase of a burial place for Sarah. It was in the cave of the field of Machpelah; and it afterwards received the bodies of himself, of Isaac, and of Jacob.

Joseph's body, having been embalmed, and put into a coffin, in Egypt, was brought away by the Israelites when they quitted the country, and buried in a plot of ground in Shechem, which Jacob had purchased of the sons of Hamor (Gen. i. 25. Jofh. xxiv. 32.) Moses was secretly buried in a valley in the land of Moab, (Deut. xxxiv. 6.) and no man knew of his sepulture. Eleazar, the son of Aaron, was buried on a hill. (Jos. xxiv. 33.) Job, in his own house in the wilderness. (1 Kings ii. 38.) Manasseh and Amon, in the garden of Uzza; (2 Kings xxvii. 18. 26.) and Rehoboam, Aafa, Jehosaphat, Joram, Amaziah, Azariah, Jotham and Ahaz, in the city of David, with their fathers. "Job's, too, was buried in the city of David," but not in the sepulchres of the kings. (2 Chron. xxvii.)

From the profane writers of antiquity we learn the practice among other nations; and not only from their authority, but from daily observation, we find the high raised tumulus continued a mark of respect amongst the living, and a signal honour amongst the dead in every age of which we have any record. Barrows are the most ancient sepulchral monuments in the world: and their contents are as various as the different people that occupied the globe, or the different circumstances by which they were distinguished. The pyramids of Egypt are but barrows of a more solid material: and the church-yard hillock of the present day is but a relic of their universal prevalence. Homer is very particular in describing the barrow of Patroclus. It was first marked out with a circle; the foundations were then laid round the very spot where the funeral pile was still uncooled, and the earth thrown up over them.

**Tumulus** de signa, Similla. ii. p. 172. c. 1. *Amphi* turris* in* voce in* *to* turris ecceust. *Xystetum* de* to* signa, *tumulus* xwv. *Il. i. 255—257.*

The remains of the body were collected in a golden urn, but (which is singular) were not lodged beneath the barrow.

Among the distinguished barrows of Greece may be ranked that of Egyptus in Arcadia, which Paunianis describes as not very large, and surrounded by a margin of stone: *tac* xwv* m* megas* koiv* kreti* in* kou* *stir* *kremaken* (Arcad. c. 16.), and which Homer admired (Il. B. 603.), as not having seen a finer. That of Icarus was a small one, on a headland where he was cast away: (Paunian. Bacot. c. 11.) and that of Achilles in a similar situation. (Odyssey. Ω. 36.) See Barrow.

With the Egyptians, and the ancient Greeks, (see Plato, Minos prope hui.) perfons were occasionally buried; as we have already mentioned in the case of Job, in their own houses: while in other inclusions hills and rocks were not only receptacles for the ancient inhabitants of Greece, Sicily and Afa, but of the Persians, and, to this day, of the Chinese. The general practice of burial, however, among the ancient Persians, is thus related by Herodotus, (Clo. cxx.)

**-I will**
"I will not affirm it to be true, that these never are interred till some bird or dog has discovered a propensity to prey on them. This, however, is unquestionably certain of the Magi, who publicly observe this custom. The Persians first clove the dead body in wax, and afterwards place it in the ground." The custom to which Herodotus here particularly alludes as the exclusive privilege of the Magi, was afterwards universally adopted: and, in part, still continues. The place of burial of the Chaldeans, at the distance of half a league from Ispahan, is a round tower made of free stone; it is 75 feet high, and 90 in diameter, without gate, or any kind of entrance; they ascend it by a ladder. In the midst of the tower is a kind of trench, into which the bones are thrown. The bodies are ranged along the wall in their proper cloaths, upon a small couch, with bottles of wine, and victuals. The ravens which fill the cemetery, devour them. (Chardin's Travels.) An exact model of this curious tower is preserved in the British Museum.

Among the Egyptians, the body having been embalmed by perfons legally appointed to the exercise of the proffession, was returned to the relations, who enclosed it in a cale of wood made to resemble an human figure, and placed it against the wall in the repository of their dead. (Herod. Enterpe. lxxxvii.)

The custom of burning the dead, to which we have already alluded, is, however, of higher antiquity than we may at first suppose. Saul was burnt at Jabesh, and his bones afterwards buried; and Ais was burnt in the bed which he had made for himself, filled with savourous odours, and divers kinds of spices; but the practice existed, we are assured, neither in Persia nor Egypt: the Persians thought it profane to feed a divinity with human carcase; and the Egyptians abhorred it on another account, because it was fully persuaded that fire was a voracious animal, which devoured whatever it could seize; and when saturated, finally expelled with what it had consumed. The Egyptians also held it unlawful to expose the bodies of the dead to animals; for which reason they embalmed them, fearing left after interment, they might become the prey of worms. (Herod. Thalia. xvi.) In Persia, too, at the time Herodotus wrote, the custom of burying alive was common; and he told that Amestris, the wife of Xerxes, when the was of an advanced age, commanded fourteen Persian children of illusious birth to be interred alive in honour of the deity whom they supposed to exist under the earth. (Polymnia, cxiv.)

Of the ancient Ethiopian practice we have a more minute description, related on the tradition of Cambyses' spies. "After all the moisture is extracted from the body, by the Egyptian, or some other procésse, they cover it totally with a kind of platter, which they decorate with various colours, and make it convey as near a resemblance as may be of the person of the deceased. They then inclole it in a hollow pillar of crystal, which is dug up in great abundance, and of a kind that is easily worked. The deceased is very conspicuous through the crystal, having no disagreeable smell, nor any thing else that is offensive. This coffin the nearest relations keep for a twelevenmonth in their houses, offering before it different kinds of viéntimes, and the first-fruits of their lands. These are afterwards removed, and let up round the city."

The funeral ceremonial attended the Scythian kings were still more singular. They were embalmed, and afterwards transported through the different provinces of their kingdom, till they were at last brought to the Gerihi, in the remotest part of Scythia. Here the corpse was placed upon a couch, (round which, at different distances, were fixed daggers; and upon the whole, pieces of wood covered with branches of willow) in a trench, nigh the spot where the Dorythenes begins to be navigable. In some other parts of this trench one of the conduits of the deceased, who had been previously strangled, together with his baker, cook, groom, most confidential servants, Levites, and choice effeets, were buried: and a mound as high as possible raised above the whole. (Herod. Melpomen. cxvi.) With regard, however, to the Scythians in general, the practice was more simple. When any one died, the neighbours placed the body on a carriage, and carried it about to the different acquaintance of the deceased; these prepared some entertainment for those who accompanied the corpse; placing before the body the same as before the reft. Private perfons, after being thus carried about for the space of forty days, were buried. But the Scythians did not all of them observe the same customs with respect to their funerals: there were some who interposed the dead bodies from a tree, and in that state left them to putrefy. "Of what consequence," says Plutarch, "is it to Theodorus, whether he rots in the earth, or upon it? Such with the Scythians is the most honourable funeral." The custom is also mentioned by Silus Italicus:

"At gente in Scythica suffixa cadavera truncis, Leuta dies feculit, putri liciuntia tuba."

The African Nomades observed the same ceremonies with the Greeks, but the Nymamos buried their deceased in a fitting attitude; and were particularly careful, as any one approached his end, to prevent his expiring in a reclin'd posture. (Herod. Melpomen. cxv.)

From the anecdotes of burial which have already been detailed, it should seem, that both among the Jews and Heathens, the place of interment was usually without the city. Such, also, was the case with the Athenians, the Suyrians, the Sicymonians, the Cyprians, and the Syryumians. The examples of Numa and Servius Tullus prove, that the Romans deposited their dead without the city before the introduction of the twelve tables; and it was a special privilege granted by the senate to particular persons, that they should be buried within the walls; (Cic. de Leg. ii. 23.) and the Jews, at least in the latter days of their existence as a nation, as we learn from the instances of Lazarus, (John xi. 53.) the widow's son at Nain, (Luke vii. 13.) and the dead that were raised at the crucifixion, (Matt. xxvii. 53.) observed the same place of burial. The Lacedemonians, however, buried within it. It had been a notion universally prevalent, that the touch of a dead body conveyed pollution; and Lycurgus, the legislator of Sparta, was ambitious to remove the prejudice. He not only introduced the custom of burial within the city, but erected monuments near the temples, that the youth might be trained from their infancy to the view of such objects, nor fludder at the spectacle of death.

The ancient Greeks and Romans were strongly persuaded that their souls could not be admitted into the Elysian fields, till their bodies were committed to the earth: and if it happened that they never obtained the rites of burial, they were supposed to remain in a wandering state, excluded from the happy mansions, for the term of 100 years. For this reason it was considered as a duty incumbent upon all travellers who should meet with a dead body in their way, to call dust or mould upon it three times; and of these three handfuls, one, at first, was cast upon the head.

Of those who were allowed the rites of burial, some were distinguished by particular circumstances of disgrace attending their interment; perfons killed by lightning were buried apart by themselves, being thought odious to the gods; (see Plin. ii. 54.) those who wasted their patrimony, forfeited the
right of being buried in the sepulchres of their fathers; and those who were guilty of self-murder, were privately deposited in the ground, without the accustomed solemnities.

The Athenian law mentioned by Zeller, (vii. 10.) obliged them to place the body to the west. This was the original position of the Athenians, as Solon shewed in defence of his countrymen's claims to Samos; for on opening the graves in that isle, he proved that the Athenians in it were so buried in a regular manner; but the Megarean invaders at random, and just as it happened. Laertius (Solone) says, the Athenians, and the Iolkids on Thucydides, all the Greeks, lay buried toward the east; that is, as Kuhnus on Zeller, (loc. cit.) properly explains it, with their faces looking to the east, and their heads to the west. This practice among Chaldaeans has been supposed to have a reference to the general resurrection. The motive for it among the Heathens has not been ascribed.

The Athenian practice, however, with regard to those who died in the defence of their country, was at once patriotic and affectionate, that it cannot but deserve particular attention. It affords an elevated idea of that political people. About three days before the funeral, the bones of the slain were placed in a tent raised on purpose, so that every person might have an opportunity to frequent them, and pay the last tribute of a tear. All sorts of odoriferous herbs and flowers were strewn around the tent; and each man brought some in his hand, that he might consecrate them to the memory of his favourite friends. On the fourth day a coffin of cypress was sent from every tribe, to carry all the bones of their own members. After which went an empty covered hearse, in memory of those who could not be found. The procession was carried on with a peculiar decency of sorrow, while the numbers of inhabitants, both the strangers and citizens, assembled in the train of mourners. The parents of the deceased attended at the sepulchre to weep. No eye could refrain from tears; and the melancholy dirges which appeared in the faces of all alike, seemed but a true copy of the sentiments of all. The bones were accompanied in this manner to the public place of burial, situated in a pleasant spot without the city, called Ceramius, and committed to the ground. The monument erected to the value of the citizens was adorned with pillars, trophies, and inscriptions, as usual about the tombs of the most honourable persons, and the ceremony concluded with one speech in praise of them all; the main scope of which was, to animate the living with resolution, by commending the courage of the dead; to infuse a spirit of patriotism into the minds of their fellow citizens, by celebrating the principle of action which incites the valiant to battle. (Thucyd.)

The Ceramicus was the place where the slain in battle were always buried, except those who fell at Marathon, whose distinguished merit entitled them to a monument upon the spot.

Among the Romans, interment, we find, was preferred by Numa, the Etruscan family, and Caius Marius; but both Virgil and Ovid speak of burning as the practice before the foundation of Rome; the former (Ann. xi. 281.) in the infancy of Pallas; the latter (Fast. iv. 853.) in that of Remus. Pictorius says, Numa forbade it in his own cafe; and the law of the Twelve Tables forbade burning as well as burial within the city. Tacitus (Ann. xvi. 6.) says, Poppea's corpse was not burned according to the Roman Edict. It is a misapprehension of Capitolinus's words to suppose Antoninus prohibited it. Macrobius (vii. 7.) who lived under Theodosius the younger, speaks of it as left off in his time. (See Mr. Gough's Sepulchral Mon. of Great Britain.)

The drapery of the dead among the Romans was the toga, which was white in all cases except in that of the poor, who had it black. The magistrates and military men were wrapped in their purple robes of honour, or toga praetexta, or other precious garments of various colours. Perfun of rank and fortune were buried in their official habits. Mark Anthony gave his own robe to cover the body of Brutus. By the laws of the Twelve Tables crowns were allowed to be worn on these occasions by those who had merited them, and garlands and flowers were laid on the body as it passed. The funerals of great men were conducted at the public expense. But the bodies of the Roman slaves were thrown to rot in holes dug perpendicularly, called puticula. (Phil. Trans. N° 265.)

Having thus traced the conformity and occasional variation of practice among the more ancient nations in the article of sepulture, it may be worth while to deduce its history in England.

Both cremation and simple interment were rudical and ancient British fashions. The latter rite, however, was observed with the wild addition of whatever was of use in this life, under the notion that it would be wanted by the deceased in the world below; and in confirmation of this, arms and many singular things, of unknown use, are to this day discovered beneath the places of ancient sepulture. (Pennant's Tour in Wales, p. 581.) Barrows were their oldest tombs. Beneath some we find urns; beneath others skeletons; and in many instances, both. (Gough's Sep. Mon. i. iv.) The kilt-van or coffin, composed of rough flones etc., was an opportunity of laying the body to rest, as the sides, and ends, was another receptacle of the dead, as if lying in Britain; (Ibid. p. xvi.) these are frequent in Wales; but seldom found to contain skeletons, or remains of bodies in them. See Dr. Stukeley's Abury (p. 13.) of one found in a barrow at Kowllhrich; and another (p. 42.) similar, in Monkton field near Abury. Two that were found in Purbeck, on making a turnpike road to Corfe, had skeletons in them. Of this earlier kind and date were the rude flone cellars under barrows in Orkney, which contained entire bodies. The Tartarian barrows have absolute flone vaults under them. (Arch. vol. ii. 221.)

The next and last improvement of the flone coffin, was by forming it of a single flone with mallet and tool; and this Dr. Pegge ascribed to the Romans; for he apprehended that during the general prevalency of the customs of cremation and urn-burial among the Romans, they had not always recourse to the funeral pile, but that bodies were sometimes interred whole and in their natural state. (Sep. Mon. i. xx.) Influentes of Roman coffins of several pieces of flone are cited by Mr. Gough in the Sepulchral Monuments (vol. i. p. xxi.); and others, (p. xxvi.) to prove that the Romans used brick coffins, or sarcophagi, in their earlier periods. In the celebrated family vault of the freedmen of Angelus and Livian, discovered by the tide of the Appian way about a mile out of Rome, 1725; among a few marble sarcophagi were two of baked-earth, made to contain the body whole. The Romans in Britain buried their warriors near the via praetoria or military ways; and hence we may derive the frequent inscription of Siste Aspice Viator.

Woden enacted a law for burning the dead, which not only the Saxons and the Danes, but the remote Saxons, and all the Scandinavian nations regularly observed; and humated the ashes, with or without urns, as circumstances required. The Danes distinguished this, and the different funeral
funeral ceremonies three several epochs. (Worm. Mon. Dan. p. 40.) The first, which was the same with that in question, was called Rofold and Brumefide, or the age of burning. The second, was styled Hoogahl, and Hoifeide, or the age of tumuli or hillocks. The corpse at this period was placed entire, with all the ornaments which graced it during life. The bracelets, or arms, and even the horse of the departed hero were placed beneath the heap. Money, and all the rich property of the deceased, used to be buried with him, from the persuasion that the soul was immortal (Pomp. Mela. i. iii. c. 2.) and would stand in need of these things in the other life.

Among the northern nations, when piety was esteemed honourable, these illusory robbers directed that all their rich plunder should be deposited with their remains, (Bartolomius Antig. Dan. 43.) in order to stimulate their offspring to support themselves, and the glory of their name by deeds of arms. Hence it is we hear of the vault riches discovered in sepulchres, and of the frequent violation of the remains of the dead, in expectation of treasures, even for centuries after this custom had ceased. The third age was called Grifidenia-old, when the introduction of Christianity put a stop to the former customs.

From the remains of the writers who have been already cited, we learn that the custom of burning, among the several nations, ceased with paganism. It therefore fell first into disuse with the Britons; for it was for some time retained by the Saxons after their conquest of this kingdom; but was left off on their receiving the light of the gospel. The Danes retained the custom of urn-burial the last of all; for of all the northern nations who had any footing in these kingdoms, they were the last who embraced the doctrines of Christianity.

With regard to the barrows or tumuli, so frequent through the country, we have no good criterion by which a correct judgment may be made of the people to whom the different species belong; whether they are British, Roman, Saxon, or Danish. Some of them consist of heaps of naked stones, such as those in the isle of Arran; in many parts of Scotland; and in some parts of Cornwall. Others are composed of stones and earth, nicely covered with earth and sod. And they were sometimes of earth only. The size of the tumulus usually marked the quality of the person; and the earth and sods which were skimmed and paired from the surface round it, were lightly heaped up, and conferred on the deceased the last good wish, Sit thii terra levis. The generality of these were round; but others were conical, and some, as on the plains of Wiltshire and at Rollwright, of an oblong form. Finally, other places of ancient sepulture consisted only of a flat area, encompassed like the druidical circles, with upright stones; and such were those of Ubbo, and of king Harold in Sweden. (Succia Antiqua and Hodierne, tab. 515.)

The urns are also found placed in different manners, with the mouth resting downwards upon a flat stone, secured by another above; or with the mouth upwards, guarded in a like way. Very frequently the urns are discovered lodged in a square cell composed of flags; and sometimes more than one of these cells are found beneath a corn or tumulus. Mr. Pennant even met with no fewer than seventeen, near Dupplin in Perthshire, disposed in a regular form. The urns found in these cells are usually surrounded with the fragments of bones that had refitted the fire; for the friends of the deceased were particularly careful to collect every particle; which they placed, with the remains of the charcoal, about the urns, thinking the neglect of it the utmost impiety. (Pennant's Tour in Wales, loc. cit.)

The introduction of Christianity made a great alteration in the mode of burying the dead. Cremation ceased. The believing Romans betook themselves to the use of sarcophagi. The Romanized and converted Britons would naturally do the same. The Saxons as the successors of the Britons inclined from the very first to adopt their practices. And after the arrival of St. Aidan in 597., and the confecration of the nation, c fmins, as well as the mone of placing the body to the ear, universally took place. The oldest instance of a coffin that we know of in the Saxon times, was that of Ethelreda in 65. (Sep. Mon. l. xxvii.) and from this time downward, stone coffins have been continually discovered in every part of England. They may be regularly traced among us from the ninth century to the reign of Henry III.; and in some catacombs to that of Henry VIII. (Gent. Mag. 1759. p. 6.)

In the Norman times it was the custom to bury monks in the bare ground. Warin, the twelfth abbot of St. Albans, in 1195, ordered that they should be buried in stone coffins as more decent. (Matt. Paris, vit. ab. Albin. p. 95.)

Among the primitive Christians burying in cities was not allowed for the first 300 years; nor in churches for many ages after; the dead bodies being first deposited in the atrium or church-yard, and porches, and porticoes of the church. On the introduction of Christianity into this country, a regular form of disposing of the dead bodies took place. The altar in the first Christian basilica was placed in the call of it, under a window, to receive the first advantage of light, or in conformity with what is said of our Lord's ascension. The people for greater regularity in worship were taught to look towards the altar; and the dead for a similar reason, were buried with their faces the same way; except the priests who were ordered by the same authority to face the congregation. The reason alleged by Gregory the Great for burying in churches or in places adjoining to them, was that their relations and friends, remembering those whose sepulchres they beheld, might hereby be led to offer up prayers for them. Hence too that striking and solemn address which marked the epitaphs of the monastic ages: Oration pro animas nefertim pretiosiorum. Gregory's reason was afterwards transferred into the body of the canon law. To this superstitious and profane custom we may ascribe the original of church-yards. In the eighth century, the people began to be admitted into them. And princes, founders, and bishops, into the church. The practice, first introduced into the Roman church by Gregory the Great, was brought over here by Cuthbert, archbishop of Canterbury, about the year 750; and the practice of erecting vaults in chapels and under the altars was begun by Lanfranc, archbishop of Canterbury, when he had rebuilt the cathedral there, about 1075. From that time the matter seems to have been left to the discretion of the bishop.

It was remarked to the writer of the present article by a learned antiquary, who is now no more, that in ancient times in this, and perhaps in other countries, then Roman Catholic, interment was never practised on the north sides of the church. An opinion prevails that it was left for malefactors, for the unbaptized, for suicides, and for such as had incurred the greater cenfure of the church: and common observation will confirm the fact. at the present moment, that many more graves occur on the south than on the north sides of our churches. An extract from a letter of
of Mr. Samuel Denne (the gentleman above alluded to) affords a curious illustration of what has been alluded to. There is reason to believe that sixty years ago the north side of the church-yard of Wilmington (in Kent), might be unoccupied by corpses; and in 1753, on digging a grave to the north of John Chapman's head-stone, for the interment of Richard Harman of Stonehill, not a human bone was found, nor were there any marks of the ground's having been before moved. But in 1745 and 1746, when the hospital of the regiments of infantry, encamped upon Dartford heath, was in the manor house formerly belonging to the Langworth family, 35 soldiers who died in the hospital were buried in this spot.

"On opening the ground for the interment of one of them, midway between the wall of the church, and the fence of the church-yard, and about ten feet to the west of Mr. Fowke's tomb, John Woodmansey, the parish clerk, discovered an earthen pot containing money, of silver. The quantity was not known, nor does any attention seem to have been shown to the date of the pieces it contained. In consequence of this omission there is an ignorance of one circumstance that might nearly have affected, in which national commotion this treasure was concealed. It is, however, an obvious remark that the owner of it thought this quarter of the church-yard a very secure place, which adds weight to the opinion, I have already hinted, that the parishioners of that age had an insuperable objection to the burying of their relations and friends behind the church.

In regard to the rites of burial as they are practiced in the more distant quarters of the globe, our observations will be few. In Japan, Peru, Peru, Mexico, Tartary, Siam, and the Great Barrier's dominions, the dead are buried: and for people of superior consideration the fires are made with aromatic woods, gums, balsams, and oils. In China, we are told it was formerly the custom to bury slaves with emperors and princes, and sometimes also their concubines alive; but this cruel practice has given way, in modern times, to the more harmless one of burning representations of their domestics in tin foil, cut into the shape of human beings, and of placing their statues in wood or stone upon their graves; this seems to be the remain of the Scythian custom which has been already quoted from Herodotus. The last remains of a relation are interred with all the honours that the family can afford. (Barrow's Travels in China, p. 483.)

Among the Birman the deceased is burnt, unless he is a pauper, in which case he is either buried or cast into the river, as the ceremony of burning is very expensive. When the pile has been reduced to ashes, the bones are gathered and deposited in a grave. Symes's Ava. p. 314.

With every different tribe among the Hottentots, we are assured, the funeral ceremonies are alike. The deceased is thrust either naked, or with his pelisse on, into a hole in the earth, or subterraneous passage, where the body usually becomes the prey of some wild beasts; though the relations generally thrust brush-wood or bushes into the aperture of the hole or passage. (Sparrman's Voyage to the Cape of Good Hope, i. 358.) Another custom of a more horrid nature is likewise related on the same authority; Sparrman says, that it is a common practice, in case of the mother's death, to inter children at the breast alive. In New South Wales, the dead are burnt, afterwards deposited in the ground, and a funeral hill cock raised upon the ashes. (Hunters's Voyage to New South Wales, p. 64.) Lastly, we shall mention, the custom of burial among the South Sea Islands. At Otaheite the inhabitants bury none in the Morai, but those offered in sacrifice, or slain in battle, or the children of chiefs which have been quartered at the birth: An act of atrocious inhumanity too common. When a peron of eminence dies, even if a child of the inferior classes, he is prefered and not buried, unless he died of some contagious or offensive disease. They take out the viscera, and dry the body with cloth, anointing it within and without with the perfumed oil, and this is frequently repeated. The relations and friends, who are absent, perform their part of the funeral rites at their arrival, each female presenting a piece of cloth to the corpse; and they continue to dress and decorate the body as if alive, and to furnish it with provisions, supposing that the soul which roams round receives satisfaction from such marks of attention; they therefore not only take care of it, but repeat before it some of the tender scenes which happened during its life time. While any offensive smell remains they anoint the corpse with sweet-scented oil, and surround it with garlands of flowers. A dead chief is usually carried round the island to the different districts where he had property, or where his particular friends reside; and the funeral ceremony repeated: but after a tour of some months, he is brought to rest at the place of his usual residence. Some bodies are preferred like dried parchment; others, when the flesh is mouldered away, are burnt. (See the First missionaries' Voyage, p. 362, 364.)

By our common law, the granting of burial within the church is the exclusive privilege of the incumbent: except in cases where a burying place is preferred for as belonging to a manor-house. (Gibson. 459.) The churchwardens, by custom, have, however, a fee for every burial there, by reason the parish is at the expense of repairing the floor. (Watson's Clergyman's Law, cap. 39.)

By the statute, 30 Car. 2, fl. 1, c. 5, for the encouragement of the woollen manufactures, and prevention of the exportation of money for the importing of linen, it is enacted, that no corpse of any person shall be buried in any shirt, shift, sheet, or shroud, or any thing whatsoever made or mingled with flax, hemp, silk, hair, gold, or silver, or in any stuff or thing, other than what is made of sheep's wool only; on pain of 5l. And an affidavit shall be made for this purpose either to a magistrate or the officiating minister.

By the canons of the church (Can. 68.), no minister shall refuse or delay to bury any corpse that is brought to the church or church-yard (convenient warning thereof being given him before) except the party deceased were denounced excommunicated majoris excommunicationis, for some grievous and notorious crime, and no man able to testify of his repentance. There were anciently other caufes of refusal, particularly of heretics, against whom there was an efpccial provision in the canon law, that if they continued in their heresy they should not have christian burial: though no infulences of its enforcement occur subsequent to the period of the reformation. They who had not received the holy sacrament, at least at easter, were excluded from christian burial by a law of the Lateran council, which became afterwards a law of the English church. In like manner, perons killed in duels, tiats, and tournaments. But, at this day, these prohibitions are restrained to the excommunication, the unbaptized and suicides.

Burial, Christian, is often used to denote that which is performed in holy ground, and with the usual service or ceremonies of the church.

Burial is also used to denote the dues paid for interment, especially to the minister. The burial fee paid to the priest on opening the grave, was called by our Saxon ancellors foul-fot. Phil. Trans. N° 189.

Burial.
BURIAL of an as, of the sepulchre, an ignominious kind of burial out of holy ground, under the gallows, or in a highway, where several roads meet, and performed by public hangmen, or the like. Such is that of suicides, excommunicated persons, &c. sometimes denominated canine burial, or burial of a dog.

In the middle ages we also find mention of a peculiar kind of burial, called imploitation, practiced on the bodies of persons excommunicated. Du Cange.

BURIAL of the crucifix, Sepulchrum crucifixu, denoted a representation of the burial of Christ, anciently performed annually in churches on the day of the Pasch. Du Cange.

BURIALS, in computations of mortality, denote deaths, and stand opposed to births. In this sense, we have estimates of the burials in Brandenburg, in Prussia, Breslau, &c. Phil. Trans. No. 261, 224, and 176.

By a statute under king Charles II, a registrar is to be kept in every parish, of all persons buried within the same, or at the common burial-places thereof. Stat. 33 Car. II. c. 3. See Mortality.

Burial is also used for the inclosing of vegetable or mineral bodies in the ground, for divers purposes. Lord Bacon gives divers experiments of burying fruits, &c. for preservation and condensation, and to give nourishment to their respective trees. Works, tom. iii. p. 80.

Some commend burials in the earth, others in wheat, to seafon timber when first filled, and to make it of more durable use. Chemists sometimes bury their cements. The Chinese are said to bury their porcelain, to give it the greater beauty.

BURIANA, in Geography, a town of Italy, in the territory of Sicily, near the lake of Catania; 16 miles S. of Montieri.

BURIAS, or Burins, one of the Manillas or Philippine Islands, south of Luzon, about five miles in compass, inhabited by a few tributary Indians, who are comprised in the parish of Mabate, which is another larger island south of it, and not far distant from Ticao. N. lat. 12° 30'. E. long. 123° 0'.

BURICH. See Buderich.

Burich, is also a town of Germany, in the circle of Swabia, and margravate of Eaden-Durlach: five miles from Philipenburg.

BURIDAN, John, in Biography, a celebrated school-man of the 14th century, was a native of Bethune, and became professor in the university of Paris, and, as some say, regent in 1320. Aventine relates, that he was a disciple of Ockham, and being attached to the fét. of the Nominals, was obliged by the prevalence of that of the Realists to quit Paris, and to remove to Germany, where he founded the university of Vienna. He wrote "Commentaries on Aristotle's Logic, Ethics, and Metaphysics;" but he has been principally remarkable on account of the sophism or argument, commonly called "Buridan's Afs." This seems to have been introduced for the purpose of illustrating the doctrine of the sages, of yielding to impressions of the senses under which doubts are placed, and in which they are supposed to differ from man, who possess free-will, or an internal self-determining power. With this view, Buridan feigned an angry as, placed between two measures of oats, in such a manner, that each made exactly the same impression on his senses; in which case, for want of a power of choosing one rather than another, he must die of hunger. The term "Buridan's Afs," has been since proverbially used to denote difficulty and hesitation in determining between two objects. Gen. Dict.

BURIE, in Geography, a town of France, in the lower Charente, and chief place of a canton, in the district of Saintes; the place contains 1510, and the canton 10,258 inhabitants; the territory comprehends 127½ square leagues, and 11 communes.

BURIGNY, N. Levsey Le Broc, in Biography, an able man of letters, was born at Rhuna in 1691, and devoting himself to literary pursuits, acquired universal respect for the mildness and simplicity of his character. He was a member of the Parisian academy of belles lettres; and prolonged his life, with the exercise of his faculties, to his 94th year. His works are "A Treatise on the Authority of the P. 1720, 4 vols. 12mo. "History of Pagan Philosophy," 1724, 12mo., and 1754; "General History of Sicily," 1745, 2 vols. 4to.; "A Translation of Porphyry on Abstinence from Wine," 1747, 12mo.; "History of the Revolutions of Constantinople," 1750, 3 vols. 12mo.; "The Life of Gratius," 1754, 2 vols. 12mo.; "of Erafimus," 1757, 4 vols. 12mo.; "of Diokletian," 1761, 12mo.; "of Cardinal de Perse," 1768, 12mo.; all in French. His works, which in their general character are correct, but diffuse and turgid, are esteemed valuable collections of authentic facts. Nov. Dict. Hist.

BURIS, in Surgery, a name given by Avicenna, and some other old authors, to a febrile herna, caused by a hard abscess.

BURKA, in Geography, lies in the island of Angra, in the gulf of Ballora, and has a spacious harbour, with plenty of water. See Angra-Island.

BURKE, EDMUND, in Biography, was born in Dublin, on the first of January, 1750. His father was an attorney of the Protestant persuasion. The son was placed, during the earl part of his education, under the care of Abraham Shackleton, a Quaker schoolmaster of considerable merit, for whom his illustrious pupil entertained so large a share of affection through life, as never to omit paying him an annual visit of gratitude and respect, during a period of forty years. From Ballybore near Carlow, the residence of Shackleton, Mr. Burke was removed, at the age of sixteen, to Trinity College, Dublin. It is well known that he was more attentive to the infusions of his country school-master, from whom he early derived much of his miscellaneous knowledge, than to the more regular discipline of tuition, instilled by the university. He gained no prize; but he obtained his scholarship, during the second year of his residence, which proves him at least not to have been deficient in classical attainments; for of such are that honour and emolument the reward. He was contemporary with Goldsmith; but it does not appear that any friendship commenced between these two great men, till after the poem of the "Voyager" had established Goldsmith's reputation. There is no foundation whatever for the opinion, that Burke was bred a Catholic; and it seems now generally agreed, that he did not study his studies at St. Omer's. He was a candidate for the professorship of logic at Glasgow, but was too late in his application. On this disappointment, he repaired to London in 1749, after having taken his bachelor's degree, and entered himself a member of the Temple, with a view of being called to the bar.

At this time, the narrowness of his finances reduced him to the necessity of writing for the periodical papers; to which, he contributed essays on literary and political topics: but though the sphere in which he moved was not that of pleasure and fashion, he procured an introduction to the celebrated Mrs. Woffington, the actress, in whose society he passed many of his leisure hours. The severity with which he applied himself both to composition and study, having
considerably affected his health, Dr. Nugent was called in, who removed him from the inadequate accommodations of the Temple to the comforts of his own house. The attention of the family, and the particular kindness of Miss Nugent led to a matrimonial connection, in which Mr. Burke's expectations of domestic happiness were fully answered.

Mr. Burke's first acknowledged publication was, "A Vindication of natural Society; or A View of the Miferies and Evils arising to Mankind, from every Species of artificial Society," written in imitation of Lord Bolingbroke, for the purpose of attacking ironically that writer's philosophy, and exposing its injurious consequences. It did not meet with the reception which has since been thought to have been justified due to its merit as a composition.

He was not however discouraged by this failure from publishing his "Essay on the Sublime and Beautiful," which had been composed prior to the "Vindication," but referred for the advantage of making a first appearance under cover of a well-known and admired character. Both these works came out in 1756.

Though there was no name to the "Inquiry," the first edition was fold within the year, and a second published in 1757, with an "Introductory Discourse concerning Taste." The applause which attended this performance was not temporary, nor the connections consequent on it without permanent advantage. It procured him relief from his pecuniary embarrassments, and an easy introduction to the circles of the first rank and abilities. Among the first who sought his acquaintance, were Dr. Johnson and Sir Joshua Reynolds, to whom he has been supposed to have furnished the composition of the "Discourse to the Royal Academy." Much has been said on the subject; but there seems no reason for depriving the late illustrious president of the fame attached to an excellent writer, as well as an original and accomplished artist.

It was Mr. Burke's intention to have controverted the theories of Berkeley and Hume; he then thought of rivaling the historic labours of the latter in "Memoirs of his own Times," for this purpose, he had made himself master of English history, especially since the revolution; and the project ended in the establishment of Dodsley's "Annual Register," a very valuable work, of which he had the principal direction from 1758 to 1789.

In 1761, he accompanied "Single-speech Hamilton" to Ireland. This latter gentleman made one very excellent speech in the English, and one more in the Irish house of commons; and Mr. Burke has been said to have been the composer of both these speeches, but probably with as little reason as in the case of Sir Joshua's discourses. On Mr. Burke's return from Ireland, with a pension of £500 per annum, it was no longer necessary to write for periodical publications. He, however, contributed occasionally to the "Public Advertiser," where the excellence of his writings introduced him to the notice of the marquis of Rockingham, while Mrs. Woffington recommended him to the duke of Newcastle. He accordingly became private secretary to the marquis, at the instance of Mr. Fitzherbert, and member for Wendover on lord Verney's interest, and thus commenced his political career.

In February 1764, was founded that club, which afterwards became distinguished by the title of the Literary Club. Sir Joshua Reynolds was the first proposer, and Johnson acceded to the plan, in the hope of enlarging his circle, and recovering the opportunities for conversation, which he had lost by the dissolution of the meeting in Ivy-Lane. The original members of the literary club were, besides the two founders, Mr. Burke, Dr. Nugent, Mr. Beaufort, Mr. Langton, Mr. Chamier, sir John Hawkins, and Goldsmith. They met at the Turk's Head, in Gerard street, Soho, on every Monday evening through the year.

About the time of Mr. Burke's entrance on public life, men's minds were equally agitated by the measures of government respecting Mr. Wilkes, and the growing discontent in America. Of the two parties in opposition, that of Mr. Pitt having been professed on very precarious conditions, expecting court favourites and secret advisers, the duke of Newcastle, of whole party, on account of his age and infirmities, the marquis of Rockingham was considered as the leader, clasped with the terms on which a new administration was proposed. Mr. Burke now, with a facility to which he was too prone, seceded from his old friendship with Mr. Hamilton; but he is said, at the same time, to have received the pension procured through that gentleman's interest. From this time he became a professed party-man; a bondage to which he was in some measure compelled, by laying himself under pecuniary obligations to the marquis of Rockingham. The nature and extent of the favour he received have been variously represented; but it is certain, that a considerable part, if not the whole of the purchase money for his villa at Beaconsfield, of which he now took possession, was promised either as a loan or a gift by the marquis.

On his entrance into parliament, he took infinite pains to qualify himself for the discharge of his new duty. Among other sources of improvement, he disdained neither the writings of the fathers, the unaffectedness of the school divines, the perusal of precedents and records, nor the oratorical contents of the Robin-Hood society. His principal opponent at the Robin Hood was a baker, of whom Goldsmith said, that "Nature intended him to have presided in the court of chancery." He procured his seat in 1755, and his first speech was on the damp act. It attracted the notice, and obtained the applause of Mr. Pitt; Mr. Burke was principally consulted by the Rockingham administration on the affairs of America, and the middle course was adopted in conformity with his advice. The work of the party, and the levities of their policy, soon brought the ministry to a close; and its dissolution was hastened by Mr. Burke's project of a Canadian constitution, which lord Northington condemned in the most angry and contemptuous language. Mr. Pitt then made his own terms, as he thought, with the court. Mr. Burke had scarcely time to defend the conduct of his friends in print, before their successors resigned, and the parliament was dissolved. Mr. Burke was re-elected for Wendover, the Grafton ministry came into power, and Mr. Burke was the principal orator of opposition. He was adverse to the expulsion of Wilkes, and made an able speech to prove his intemperate eligibility, though he disliked the general character of the man. About this time, the letters of Junius began to appear; and on this occasion, the public have not lost sight of their propensity to attribute an able composition to Mr. Burke. There seems to be not the least foundation for supposing him to have been their author. He, however, gave his opinions and principles at considerable length, in his "Thoughts on the Cauces of the present Discontents." The leading features of this pamphlet were, a pointed invective against mean cabinets and secret influence, and a picture of what a house of commons ought to be. Those who seek in this work for proofs of political apostacy in later life, will not find the evidence so decisive as they expect. The remedies proposed were not those of democracy, but of a fellow-feeling to be established between the aristocracy and the people. As a proof that
the views of the author did not even then rise up to the expectations of the Whig-party in general, he was attacked by Mr. Macaulay, as well as by the friends of the court.

While Lord North was minister, the impetuousness of syllephant opposition seems to have carried Mr. Burke's vindication of freedom further than was compatible with that fondness for ancient establishments, which always existed in his mind, and became so much stronger in the latter part of life. He took a distinguished part in the debates on the liberty of the press. During the whole of the American war, he uniformly opposed the minister with zeal and ability, and defended the people with warmth and energy. His habits during this period were those of sobriety and literary industry, as well as of parliamentary vigilance and exertion.

It is to the credit of both parties that political differences made no breach between Burke and Johnson. The latter, on taking leave of his host at Beaconsfield, wished him all the success on his canvass at Bristol, which "could possibly be wished him by an honest man."

The famous Bristol election took place in 1754, when Burke and Cruger, an American merchant, turned out lord Clare and Mr. Brickdale, the former representatives. So little assistance did Mr. Burke derive from Mr. Cruger's eloquence on the hustings, that the confiant and only speech of the latter was, "I say ditto to Mr. Burke! I say ditto to Mr. Burke!"

It would exceed the limits of this article to detail Mr. Burke's controversy with Dean Tucker, or the part which he took on every great political question. It is necessary, however, to mention, that on the question of parliamentary reform, the Rockingham branch of opposition opposed the measure; and the duke of Richmond, lords Shelburne, Chatham, and Camden, Mr. Dunning, and Mr. Fox defended it.

The leading features of Mr. Burke's political conduct, while pay-master general in the Rockingham and Fox administration, was the adoption of the plan for economical reform, which had been rejected by the house of commons in 1785. It however underwent several modifications. The political convulsions which ensued on lord Rockingham's death, are well remembered. The coalition, and the India bill were forged and pushed forward with much ardour by Mr. Burke, and principally, if not entirely, produced that decline of popularity, which both himself and his friends experienced.

The event in which Mr. Burke stood most prominent before the public, in the interval between the formation of Mr. Pitt's ministry, and the French revolution, was the impeachment of Mr. Hatlings. His speeches on this occasion were among the most splendid triumphs of his eloquence, though not among the most felicitous of his judgment. They were marked by intemperance and exaggeration, apparently produced rather by the ambition of rivaling Tully in his eloquent and delicious abuse, than arising from a sober examination of facts, or a serious conviction of guilt. The charges of avarice and malice have never been adequately supported, and can only be mentioned to be denied in grave and impartial biography.

Mr. Burke had never been remarkable for an even temper in the discussion of political questions: his irritability increased with his years, and his conduct became impetuous and violent. He injured the cause, and incurred the displeasure of his associates on the question of the regency, and burst asunder all the ties of friendship, as well as political connection, on the breaking out of the French revolution. That event, together with the conduct and opinions of Mr. Burke relating to it, is so recent, that it will be sufficient barely to enumerate his publications on the subject, with the single observation, that he seems from this time forward to have cherished his antilegal principles into the most inveterate bigotry, and to have negatived in turn every maxim of practical freedom, which he had formerly enforced. Still, however, it is to be hoped, that his manners, as a public man, may candidly be attributed to impetuosity of character, and dulness of imagination, rather than to any worse motives.

The celebrated "Reflections" were published in October 1790, which were first answered by Dr. Prittle, in vindication of his friend Dr. Price, and afterwards by Thomas Paine in his "Rights of Man."

The next publication of Mr. Burke was his "Second Letter to a Member of the National Assembly," and the third, his "Appeal from the New to the Old Whigs," in consequence of the publication from the whig club, declaring Mr. Fox to have maintained the pure doctrines of English whiggism.

In 1794, Mackintosh's "Vindication of Gallican" appeared, and Mr. Burke's principal publications afterwards were, his "Letter to Lord Fitzwilliam," and "Thoughts on a religious Peace."

On the close of Mr. Hallings' trial, Mr. Burke retired from parliament; but his domestic comfort was irretrievably impaired, and his life probably shortened by the death of his son, in the year 1794. The father survived three years, which were principally employed in acts and schemes of benevolence to the French emigrants and their families. He retained his faculties in perfection to the last, and died without bodily struggle, or discomfort of mind, on the 8th of July, 1797.

The qualities of Mr. Burke's mind will be best exemplified by a few of his opinions on literary subjects. Virgil and Lucretius were his favourite Latin poets. He preferred the histories and epitaphs of Horace to the odes. He esteemed the Greek historians and orators more highly than the Latin. The delineation of ancient manners and characters in Homer delighted him; and he read the Odyssey more frequently than the Iliad. Among the dramatic writers, he gave the preference to Euripides over Sophocles. The modern authors with whom he was most pleased, were Bacon, Shaftesbury, Addison, Le Sage, and Fielding. He thought Richardson far inferior to the latter; he did not like Swift, and had a very poor opinion of Gay; particularly of his "Beggar's Opera."

He paid much attention to farming, and displayed taste in his improvements at Beaconsfield. He was one of the most successful gentlemen farmers, and constantly supplied his family in town from the produce of his own estate. He was particularly hospitable, and indulged in the pleasures of the table, but never to excess. He was liberal to common beggars; and ascribed the ordinary principle of discouraging them, rather to avarice than policy.

As a speaker, Mr. Burke was characterized by a superficiality of ideas and images, often too abundant to be applied with propriety, or felicitous and arranged with judgment. Early in life, he was remarkably careful of his language, and revised his speeches with attention. Latterly, he became blamably diffuse and extravagant, though his ingenuity never failed. He was particularly ambitious of excellence in the management of his voice and action; yet, after all, the former was but harsh, and the latter forcible, but strained.

His "Essay on the Sublime and Beautiful" has placed him in the highest class of writers on subjects of taste and criticism; nor can his whole character be summed up with so much strength, conciseness, and truth, as in the memor-

"Burke is one, with whom, if you were to take shelter from a shower under a gate way, you would try you had been in company with the most extraordinary man you had ever seen."

**BURKE, in Geography, a county of America, in Morgan district, North Carolina, containing 818 inhabitants, of whom 525 are slaves. Its capital is Morgan-town.**

**BURKE, John James, in Biography, an eminent civilian, was defended of a noble family, originally from Lucca, and born at Geneva in 1694; where he became honorary professor of jurisprudence in 1720. After travelling into France, Holland, and England, he commenced the exercise of his functions, and rendered his felicitous and flourishing. One of his pupils was Prince Frederic of Hesse-Cassel, who, in 1734, took him to his residence, and detained him there for some time. Upon his return to Geneva, he surrendered his professorship; and in 1740 entered into the grand council; and, as a member of this illustrious body, he continued to serve his fellow-citizens till his death, in 1750. As a writer, he was distinguished for his originality by his clear and accurate method of detailing and illustrating the principles of others; among whom are Grotius, Puffendorf, and Barbeyrac. His works are, "Principles of Natural Law," 4to. Geneva, 1747; often reprinted, translated into various languages, and long used as a text-book in the university of Cambridge; and "Political Law," 4to. Gen. 1751; a pathomous work, compiled from the notes of his pupils. Burlesque was much esteemed in private life; and respected as a lover of the fine arts, and a patron of artists. He had a valuable collection of pictures and prints; and a medal of him was executed by Daffier in a style of superior excellency. Nov. Dict. Hill.**

**BURLATTS, in Geography, a town of France, in the department of the Tarn, and district of Cahors, 4 miles east of it.**

**BURLAW, or BYRLAW, lurian, in Middle Age Writers, denotes country laws, or the laws concerning country affairs. Du-Cange. See BYE-LAW.**

**BURLEIGH, in Biography. See Cecil.**

**BURLING, or BURNE, a jocose kind of poetry, chiefly used in the way of drollery, either to excuse laughter merely, or to provoke derision and ridicule. Of the former kind is "Virgil travestie," which degrades a grave subject, by a certain colouring, so as to be ribald; and of the latter, the "Lutrin" of Boileau, which lays hold of a low and trifling incident to expose the luxury, indolence, and ligious temper of a set of monks. This kind of burlesque produces effect by elevating the style far above the subject, and yet affecting to consider it as of the utmost dignity and importance. In a burlesque poem, such as the Lutrin, the Duplenfary, and Hudibras, machinery may be employed with greater advantage than in any other species of poetry; and the more extravagant the machinery in a ludicrous poem, the greater is the entertainment which it affords. "Burlesque," says Mr. Shenton, (Works, vol. ii. p. 183. 3d edit.) "may, perhaps, be divided into such as turns chiefly upon the thought, and such as depend more upon the expression; or we may add a third kind, consisting in thoughts ridiculously dressed in language much above or below their dignity. The Splendid Shilling of Mr. Philips, and the Hudibras of Butler are the most obvious instances. Butler, however, depended much upon the ludicrous effect of his double rhymes." Dr. Johnson, in his life of Butler (Lives of the Poets), after observing, that "burlesque consists in a disproportion between the style and the sentiments, or between the adventitious sentiments and the fundamental subject," adds, that this, "like all bodies compounded of heterogeneous parts, contains in it a principle of corruption. All disproportion is unnatural; and from what is unnatural, we can derive only the pleasure which novelty produces. We admire it while it is a strange thing; but, when it is no longer strange, we perceive its deformity. It is a kind of artifice, which by frequent repetition detests itself; and the reader, learning in time what he is to expect, lays down his book, as the spectator turns away from a second exhibition of the same tricks, of which the only use is to show that they can be played."

F. Vaussor maintains, in his book "De Ludicia Diction," that burlesque was absolutely unknown to the ancients; against the opinion of some others, that one Rainto- vius, in the time of Ptolemy Lagus, turned the serious sub- jefts of tragedy into ridicule; which, perhaps, is a better plea for the antiquity of farce than of burlesque. The Italians seem to have the juster claim to the invention of burlesque. The first author in this kind was Berni; he was followed by Lalli, Caporalli, &c. From Italy it paffed into France, and became there so much the mode, that in 1690 appeared a book under the title of "The Paffion of our Saviour, in Burlesque Verse." Thence it came into England; but the good sense of the English never adopted nor owned it, notwithstanding one or two have excelled in it.

**BURLETTA,**
BURLETTA, Ital. from burdare, to Jeff, be jovial, decide, turn to ridicule, in Major. It is extraordinary that the term burletta, so common in speaking of comic operas, appears in no musical dictionary. Comic operas begun by an intermezzo, a single act or scene, as an act tune between any two acts of a drama. See Opera Buffa.

BURLINGTON, See Burlington.

BURLINGTON, a county of America, in New Jersey, extending across from the Atlantic ocean on the S. E. to Delaware river, and part of Huntingdon county on the N. W., in length about 60 miles. A great part of it is barren; but about three-eighths of it are under cultivation, generally level, and well-watered. It has 18,695 inhabitants, including 277 slaves. A city, the capital of the above county, under the government of a mayor, aldermen, and common council. The extent of the township is 3 miles along the Delaware, and a mile back; being about 18 miles N. E. of Philadelphia, and 11 from Trenton. The island, which is the most populous part, is about a mile each way; and includes about 150 houses, and 1000 white and 140 black inhabitants, of the last some being slaves. The streets are commodiously spacious, and mostly ornamented with rows of trees. The town is opposite to Bridget in Pennsylvania, where the river is about a mile wide. Under the shelter of Middletown and Burlington island is a safe harbour, conveniently adapted for trade, but too near to Philadelphia to allow of much foreign commerce. Burlington was first settled in 1677, and has an academy and a free-school. Middletown island belongs to the latter, and yields a yearly profit of 180l. This town has a place of worship for the Friends, who are the most numerous, and another for the Episcopalians. It has two market-houses, a work-house, and the bell gaol in the flate. Here are likewise a nail manufactory, and an excellent distillery. N. lat. 40° 9'. W. long. 74°.

Burlington, a township of America, in Otsego county, New York, divided by an act of the legislature in 1797 into two towns. — Also, a pleasant township, the chief in Chittenden county, Vermont, situated on the south side of Onion river, on the east bank of lake Champlain, and containing 332 inhabitants. The governor and patrons of the college of Vermont have selected this healthy and agreeable situation for a seminary, for the education of young persons of all denominations. Burlington is 22 miles distant northerly from Vergennes, 122 from Bennington, and 332 from the city of New York. N. lat. 44° 30'.

Burlington, or Queen's Bay, lies on the east side of lake Champlain, about 34 miles N. by E. from Crown point, 69 S. E. from lake St. Francis in St. Lawrence river, and 70 southerly from St. John's. N. lat. 44° 22'.

Burlow, a town of Germany, in the circle of Welfphalia, and bishopric of Munster; 4 miles N. W. of Borengen.

Burmann, Peter, an eminent philologist, was the son of the preceding, and born in 1676 at Utrecht, where he was educated, and where he attended the lectures of the learned Gravines. Devoting himself to the profession of the law, he studied for some time at Leyden, and in his 25th year took the degree of doctor of laws. Having gained reputation in the exercise of his profession, he was, in 1696, appointed professor of eloquence and history in his native city, and afterwards of Greek and politics. From this time he devoted himself wholly to literature, and became one of the most laborious commentators and editors of the age. He published, with his own notes and those of other critics, Villius Paterculus, Quintilian, Valarius Flaccus, Virgil, Ovid, Suetonius, Lycan, Phaedrus, and Petronius, and also a collection of the minor Latin poets, in 2 vols. 4to. He also wrote a treatise "On the Taxe of the Romans," edited several learned works, with prefaces and notes, and was the author of various disquisitions, discourses, and pieces of Latin poetry. As a commentator, he was distinguished more by his industry and erudition than for his genius and talent; and though he is deficient in the elucidation of obscure and difficult passages, he has accumulated a mass of materials from which other grammarians and critics may derive great advantage. He was twice rector of the university, and thrice private secretary to the academical senate; and to his other honours was added the professorship of the history of the United States. He died in 1741. Moren. Gen. Biog.

Burmann, John, M. D. of a noble and wealthy family, and of no mean literary acquirements, employed much labour and expense in editing various botanical works, particularly those giving accounts of plants procured from the ladies. In 1736 he published an edition of Weimann's Herbal, to which he added several plates with African plants. His next publication, in which he had the assistance of Linnæus, then a young man, was the "Thesaurus Zeylanicus: exhibens Plantas in Insula Zeylana nascendae; Iconibus illustratus," 4to. 1737, taken from various travels, with new descriptions and plates. The following year he was appointed professor to the botanical garden at Amsterdam, and soon after published "Rariarum Africantium Plantarum, Decades Decem," 4to. principally from Witten and Vanderkloof, to which, however, he made several additions. He translated Rumphiis's great work into Latin, which he enriched with valuable notes, and published under the title of "Exercitii Rumphii Herbarium Amboinense, continens plantas in os, et adjacentibus Insulis repertas." His last labour was procuring engravings to be executed, from the drawings of American plants left by Plumier, to which he added descriptions, with the modern, and former names. His son,

Burmann, Nicolas Lawrence, following the steps of his father, took his degree as doctor of medicine at Leyden, in 1759, and published, for his inaugural thesis, "Specimen Botanicum de Geraniis," 4to. In 1763, at Amsterdam, "Flora Indica, accuratissimi Zoeophytorum Judiciorum, nec

Gen. Ch. Cal. puriathius long, one-leaved, prismatic, coloured, with three longitudinal, membranaceous angles; the mouth trihod, small. Cor. petals three, ovate, oblong, placed in the mouth of the calyx, very minute. Stem. filaments fixed, very short; anthers in the mouth of the calyx, placed two by two, separated by a reflexed joint. Pet. germ superior, exstipulate, half the length of the calyx; style: thread-shaped, the length of the corolla; stigmas three, obtuse, concave. Fr. capsule covered by the calyx, cylindrical, three-angled, three-celled, three-valved, opening at the angles. Seeds numerous, very small.

Ob. La Marck describes the calyx as having its border divided into five segments, the three inner ones small, with the shape of petals. Jullien, in conformity with the principles of his systena, with respect to all monocotyledonous plants, laid before adopted the same idea. He styles it a very singular genus, allied to no other, except perhaps to Hypoxis.

Both these species were cultivated by Mr. Miller, in 1768. They are difficult to preserve in gardens, for as long as they will not thrive when planted in dry ground, they must be planted in pots plunged in troughs of water, so as to cover the surface of the mould about three inches. The troughs in which the first is planted must be carefully kept in a warm house. The other should be placed in a green house in winter, but in summer may be exposed to the open air. With this management they will sometimes bear flowers. Martyn's Miller.

BURMANNIANA, in Entomology, a species of *Phalaena* (Tortrix) of a large size. This inhabits Surinam. The wings are pale, with four black coiled spots on the anterior pair. *Gmel. &c.*

BURN, in Surgery, is a lesion of the animal body, occasioned by the application of heat in a solid form. It differs from a **scald**, only inasmuch as the latter is produced by the application of heat in a fluid form.

The consequences of a burn are more or less serious, in proportion to the extent and depth to which the ignited substance produces its effects. An extensive burn in an irritable person will sometimes occasion death, although the subjacent parts be not deeply injured; and a deep burn, of small extent, may likewise prove fatal, according to the structure or importance of the part affected.

The first effects of a burn are to cause pain and inflammation; presently afterwards, the exhalent arteries, being excited to action, will effuse a quantity of serum under the skin, and raise the cuticle like a blister; if the burning acts deeply, it will kill and decompose the subjacent flesh, so as to length to produce an eschar.

In treating burns, we must attend to the existing symptoms. If the skin remains whole, and the accident be recent, we should immediately have recourse to very cold applications, with the view of diffusing inflammation and abating pain. For this purpose, ice-water, snow-water, a solution of acetic acid, or Goulard's extract of lead, properly diluted, may be used with great freedom. Spirituous applications, which produce cold on evaporating, have been recommended with the same intention. The common people, with good reason, advise milked potatoes, or turnips, to be applied cold, as a poultice. But the above means are only proper in the beginning, and where the skin is not removed, so as to leave an excoriated or raw surface. In conjunction with these antiphlogistic remedies, we may abate pain and procure rest by the liberal exhibition of opium; at the same time interposing laxative medicines, and enjoining absolute repose to the injured part.

The plan, however, must be somewhat different in cases of deep and destructive burns, where suppuration, ulceration, or mortification, are likely to ensue.

In the second stage or degree of burns, where the mischief has penetrated rather deeply, but not below the common integuments, it is usual to apply to the part a dressing of soft ointment, which will not irritate or produce pain; such as the spermaceti ointment, fatumurine cerate, elder ointment, or equal quantities of oil and lime-water shaken together, and applied several times a day. The antiphlogistic regimen should also be observed, if the inflammatory symptoms run high.

But, when the nature of the case is very serious, and there is room to expect a gangrenous or sloughing ulceration, in consequence of the burn being very extensive, we must be cautious not to put the antiphlogistic treatment too far; nay, it may even be altogether inappropriate, and a stimulating or tonic course of remedies may be proper.

Mr. Edward Kentish, of Newcastle, who has had much practice among the workmen in the coal mines, where explosions often occur, is of opinion that pure alcohol or oil of turpentine is the best local application at the beginning, and a cordial diet to support the patient's strength. Our own experience justifies that gentleman's plan, and especially in very deep burns, where sloughing proves inevitable. We sometimes, however, have found it necessary to mix equal parts of olive, or linseed oil with the turpentine, to prevent its giving an unsufferable pain.

It is scarcely requisite to add, that in the event of gunpowder, or any other extraneous substance, being forced into the burned part, it should be gently washed away or removed with all possible care. If great tension arise in the part, we should occasionally employ warm enemial cataplams and unnyne fomentations. When the vitality of a member has been totally destroyed, so that its use is irrecoverable, we may be compelled to amputate the limb. See **Moxa**, **Caustic**, **Cautery**, **Heat**, **Scald**, and **Amputation**.

BURNING, or Basting, in Agriculture, the operation of cutting or paring off the surface of turf, and reducing it to ashes by means of fire. It is principally employed as a method of bringing into cultivation such waste and other lands as contain much coarse grass, or other vegetable productions on the surface. Where this is not the case, it can seldom probably be made use of to so much advantage. It is
is in some districts termed Burn-becating; and also Drasheeing, from Devonshire, a county in which it has been long practised. See Persing and Burning.

Burn, heart. See Cardialgia.

BURNET, Gilbert, in Biography, an eminent English prelate and writer, was born at Edinburgh in 1633. His father was the descendant of an ancient family in the shire of Aberdeen, educated for the bar, esteemed for judgment and knowledge in his profession, and disinterested in the exercise of it. As to his religious principles, he was a moderate episcopalian; and in the time of Cromwell lived in retirement, but after the restoration was appointed one of the lords of Seilicon. His mother was exemplary for virtue and piety, and zealously attached to the Presbyterian discipline. Having received the full rudiments of education from his father, he prosecuted his studies in the college of Aberdeen, and made such proficiency, that when he was scarcely 14 years of age, he took his degree of Master of Arts, and became a student of civil law. But soon changing his purpose, he devoted himself to divinity; and at the age of 18, he was put upon his trial as a probationer, or expectant preacher. Declining, on account of his youth, to accept a good living which was offered him, he finished his education by means of the counsel and conversation of some eminent Scots divines, and, in 1663, visited the two English Universities, where he had an opportunity of intercourse with the most learned persons of that period. Having again refused ecclesiastical preferment in Scotland, he travelled into Holland in the following year, and after residing for some time at Amsterdam, he passed through the Netherlands into France, and made some stay at Paris. On his return to Scotland by way of London, he became a member of the Royal Society; and, in 1665, he received priest's orders, and was presented to the living of Saltoun. Here he discharged the duties of his office with exemplary fidelity, and gained the esteem of the presbyterians, though he was the only clergyman in Scotland that used the liturgy of the church of England. At this time he incurred the resentment of the episcopal order, by drawing up a memorial of the abuses of the Scots bishops, copies of which he circulated among all the prelates of his acquaintance; but this conduct, on the part of a young man at the age of 22 years, gave such offence, that Sharp, Archibishop of St. Andrew's, preposed to deprive and excommunicate him. Against this attack Burnet made a spirited defence, and Sharp proceeded no farther. In 1666 he accepted the office of theological professor in the University of Glasgow, and continued for four years and a half to perform the duties of it with singular diligence; exposing himself at the same time, by his moderation, to the ill-will of the zealous of both the episcopalians and presbyterian parties. His pamphlet, published this year, and entitled, "A modell and free Conference between a Conformist and Non-conformist," was well received by all candid persons, though it did not escape the censtores of bigots. Notwithstanding the time and attention which he devoted to his public lectures, he was employed in arranging the papers of the Hamilton family, and compiling from them his "Memoirs of the Dukes of Hamilton," and he was thus led to negotiate and conclude a reconciliation between the earl of Lauderdale and the duke of Hamilton. During his stay in London on this occasion, he was offered a Scots bishopric, which he refused. On his return to Glasgow, he married lady Margaret Kennedy, the daughter of the earl of Caullis; who was distinguished by her piety and knowledge, and though inclined to the party of the presbyterians, was far from being a zealot, and had given evidence of her loyalty, even at the risk of her life, during the usurpation of Cromwell. In 1672, Burnet, published "A Vindication of the Authority, Constitution, and Laws, of the Church and State of Scotland," in which he defended the royal prerogatives of the crown of Scotland, and the establishment of episcopacy in that kingdom, against the principles of Buchanan and his followers. This publication drew upon him the censures of Dr. Pickles, whose calumnies he confuted, and occasioned some severe reflections of Dr. Swift, by whom he is charged with having altered his sentiments concerning the doctrines of passive obedience. Whereas the illegality of resistance, merely on account of religion, probably in opposition to the violent Scotch consciences, is the point for which he contends. It seems, indeed, always to have been his opinion, that resistance could not be justified by single acts of oppression, and that it was not lawful till attempts were made to overturn the very basis of the constitution. In recompence for this acceptable service to the court, he was again offered a bishopric, with the promise of the first archbishopric that should become vacant; but he declined accepting this dignity. In the following year he visited London with the offenible design of obtaining a licence for the publication of his "Memoirs of the Dukes of Hamilton," and, as it is said, with a secret purpose of withdrawing himself from State concerns, under a persuasion that papacy was the prevailing interest at court. At this time, however, he was a favourite with his Majesty and the duke of York, and was nominated one of the king's chaplains in ordinary. In an interview with the king, to whom he was introduced by the duke of Lauderdale, he used all the freedom which, as he thought, became his profession. But suspecting the designs of the court party, he inclined to the opposition in the Scots parliament, and thus incurred the enmity of the duke of Lauderdale, who preferred accusations against him, which deprived him of the royal favour. As a measure of personal security, he resigned his professorship at Glasgow and determined to reside in London, but upon his arrival there he was coldly received by the king, and struck out of the list of his chaplains. He was now considered as a sufferer for his principles, and, in 1675, having refused the living of St. Giles's, Cripplegate, which was offered him, he was appointed, by the recommendation of lord Holles, preacher at the Rolls, and he was soon after chosen lecturer of St. Clement's, where he acquired the reputation of a very popular preacher. In the course of this year he was repeatedly examined at the bar of the House of Commons with respect to the designs of Lauderdale, and obliged to communicate some particulars that had paf ted between himself and the duke in private conversation. The alarm that agitated the country at this time, occasioned by the progress of papistry, induced Dr. Burnet to write "The History of the Reformation of the Church of England," the first volume of which appeared, in folio, in 1679, when the papish plot occupied the public attention; the publication of this work was highly acceptable, and the author received the thanks of both houses of parliament, which was an honour that had no precedent, and he was requested to complete it. Accordingly, in 1684, he published the second volume. The third volume, being a "Supplement" to the two former, appeared in 1714. This work, though it was attacked by many censtores, has been generally esteemed the most valuable of the author's performances, and contains a correct and ample account of the transactions to which it relates. It was well received abroad as well as at home, and very much contributed to advance the reputation of the author. Dr. Birch, in his Life of Archibishop Tillotson (p. 59) observes, that this is one
of the most valuable histories in our own or any other
language: and that the publication of it was of most fea-
tious
and the alarms of popery. Dr. Burnet called for the second edition of his book, and proposed a new preface in 1682. His main theme was the decline of the protestant religion in Europe, and his advocacy of religious toleration. Dr. Burnet had been a strong advocate of religious toleration, and his works on the subject were well known.

Accordingly, in 1682, Dr. Burnet published "The History of the Reformation," which was well received. However, he was not without his critics, and his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1688, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1689, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1690, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1691, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1692, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1693, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1694, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1695, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1696, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1697, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1698, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1699, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1700, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.

In 1701, Dr. Burnet wrote "A Treatise on the History of the Reformation," which was well received. This work was a continuation of his earlier works, and it was well received. However, his works were often criticized for their pro-tection of the Protestant cause. This criticism was especially pronounced in the work of John Tindal, who wrote a series of letters attacking Burnet's views on religion. Tindal argued that Burnet was a Jesuit agent, and that his works were designed to undermine the Protestant faith. Burnet fought back with a series of replies, defending his position and attacking Tindal's views.
of the clergy: and in the following year, "Four Discourses to the Clergy of his Diocese," on the "Truth of the Christian Religion," the "Divinity and Death of Christ," the "Infallibility and Authority of the Church," and the "Obligation to continue in the Communion of the Church.

In 1694, he preached the funeral sermon of archbishop Tillotson, and vindicated his memory from the attacks of his enemies; and, in the following year, he wrote in the highest strain of eulogy, an "Essay on the Character of Queen Mary, on occasion of her death." Having left his wife in 1698, he soon supplied the loss by a marriage with Mrs. Berkley, whom he entered with the care of his children, and who seems to have been well qualified for undertaking this charge, as she was a lady of distinguished benevolence and piety. Her treatise, entitled, "A Method of Devotion, or Rules for holy and devout Living, &c." was published in 1800, and well received. In the same year, bishop Burnet was appointed preceptor to his highness the duke of Gloucester, and he took great pains in the conduct of his education till his death. In 1699, he published his "Exposition of the 39 Articles of the Church of England," which, notwithstanding the censure passed upon it by the lower house of convocation, and several private attacks, has been reckoned a learned and judicious performance. It was undertaken at the request of queen Mary, revised and corrected by archbishop Tillotson, and published, with an appendix, by the archbishops Tenison and Sharp, and the bishops Stillingfleet, Patrick, Lloyd, Williams, and More. Bishop Burnet had the honour of first projecting the scheme for the augmentation of poor living, which was functioned in 1701 by act of parliament. See Augmentation. During the remaining years of his life, he was employed in the composition and publication of several treatises appropriate to his profession, among which, we may reckon a collection of "Sermons," and "Pamphlets," 2 vols. 1700; an "Exposition of the Church Catechism," 1703; and "Sermons on several Occasions," with an "Essay towards a new Book of Homilies," and a "Preface," containing a judicious and elaborate defence of the revolution. He was also the author of a great variety of pieces, some of which were published during his life, and others after his death. A catalogue of his works, drawn up by Dr. Flexman, is annexed to the later editions of his "History of his own Time." To this catalogue, some few publications have been added in the last edition of the "Biographia Britannica;" and particularly "Thoughts on Education," printed at London in 1761, from an original MS., drawn up when the author was not quite 25 years of age, and containing a variety of observations which indicate much knowledge and reflection. The close of his life, which was terminated by a pleuritic fever on the 7th of March, 1715, was suitable to the character which he had uniformly maintained, and manifested that tranquillity and firmness, which his religious principles were adapted to produce and justify. His remains were deposited in the parish church of St. James's, Clerkenwell. By his last will he left orders, that the "History of his own Time" should not be printed till five years after his death, and then faithfully, without adding, supressing, or altering it in any particular. Accordingly, the first volume was printed at London in 1723, and the second in 1734, with an "Account of the Author's Life" annexed to it, in folio, by his son, Thomas Burnet Esq. This work has given rise to a great number of virulences, and various sentiments have been entertained concerning it. At its first appearance, a general clamour was excited against it among the Tories and high churchmen; and many other persons were offended by the freedom with which particular characters were drawn, and particular facts represented. The wisest too combined to expose it to ridicule. The real merit of this history seems to be very candidly and impartially appreciated in the last edition of the "Biographia Britannica." Allowing for the errors and inaccuracies common to the historians of that period, for some influences of party prejudice and credulity, and for that disposition to look on the dark side of a character, and to exaggerate the failings and faults of public men, which in some cases may have given a bias to the author's judgment; admitting his integrity, and his desire to state the truth of facts according to the best of his knowledge; and recollating that when he appeals to the testimony of others, he honestly refers us to his authorities, and that several of the facts which occur in his history, and which were at first regarded as dubious, have, since his time, been proved to be true; this history may be regarded as containing, upon the whole, a faithful and interesting representation of times and manners. "In short, it is written with a spirit of integrity and liberty that cannot fail of recommending it to a judicious reader; and there are few histories in our language which will be found to convey more solid and useful information. Accordingly, notwithstanding the various attacks to which it hath been exposed, it seems to be rising in reputation; and, in our opinion, (Biog. Brit.) it clearly deserves the encomium which hath lately been bestowed upon it by a very elegant poet."

"Yet Burnet's page may lasting glory hope,
How'er infaulted by the spleen of Pope.
Tho' his rough language hale and warthm denote,
With ardent hostility of soul he wrote:
Tho' critic cenfures on his work may shower,
Like faith, his freedom has a saving power."

Hayley. Ef. on His. p. 51.

This testimony deserves the more to be regarded, as the bishop has spoken of poets in terms somewhat disparaging, and thus incurred the obloquy of persons of taste. Virgil for his fancy, says Burnet, in his "Thoughts on Education," defamation not the name of a poet, but of an elegant writer. Dryden he reproves, probably referring to his plays, and not to his personal character, as a mutter of immodesty, and of impurity of all sorts; and Prior he styles, one Prior, though he had long before distinguished himself by his elegant poetical productions.

As a writer, though the bishop ought not to be ranked in the first class of authors, he deserves the praise of pertinacity, vigour, and variety of knowledge; and we ought therefore to allow for party-prejudice, when we advert to the alacrity with which Dr. Swift has reproved his style. What were his sentiments as a theologian, we may infer from the publications already enumerated, and particularly from the testimony borne to his vindication of the 39 articles by the principal dignitaries of the church. With his attachment to the church, he blended a considerable degree of moderation and liberality towards Protestant dissenters, and others who differed from him; and with respect to political matters, although he has been reproached as a party-man, he was candid in his judgment of persons of different connections, and he even exercised great kindness towards some who had engaged in devils against the government. In his general character, he was pious and devout, copedeeding and communicative, benevolent and charitable; exemplary in the diligence with which he performed all his clerical and episcopal functions, disinterested as a patriot, and eminently ardent and active in his prosecution of every
measure, which, in his judgment, tended to the public good. His fillings were vanity, credulity, self-importance, over-officiousness, and a kind of gallipipng garritude. It is natural to imagine, that, considering the times in which he lived, and the offensive part which he took in public and political concerns, he would not be likely to escape reproach; but notwithstanding the freedom and fearvity with which his principles and character have been scrutinized and confounded, his name has descended to posterity with honour, and his public services at an interesting period in the history of this country, as well as his private character, will be recognized with admiration by all persons, who are attahed to the interests of constitutional liberty and the Protestant religion.

Bishop Burnet, by his second wife, Mrs. Mary Scott, had seven children, three sons and four daughters. His three sons survived him, as well as two of his daughters. William, his eldest son, was educated as a gentleman-commoner in the university of Cambridge, and made choice of the profession of the law. Having been a great sufferer in the South sea scheme of 1720, he became governor, first of New York, and the Jerseys, and afterwards of the Massachusetts and New Hampshire. He died at Boston in 1793; and was the author of a tract, entitled, "A View of Scripture Prophecy."

Gilbert, the bishop's second son, was educated at Leyden, and as a commoner of Merton-college, in the university of Oxford, with a view to the church. Having entered into holy orders, he was king's chaplain in 1718, when he could not be 30 years of age, and he is said to have contributed to a periodical paper at Dublin, entitled "Hibernicus's Letters," and also to another valuable paper, entitled "The Free-thinker," afterwards published in 3 vols. 12mo. and now become scarce. He was also a distinguished writer on the side of Hoadly in the Bangorian controversy, and was confederated by this eminent prelate as one of his own defenders. His "Full and Free Examination of several important Points relating to Church Authority, &c. &c." was printed in 1718, 8vo. and has been reckoned a masterly performance, displaying great liberality of mind, strong powers of reasoning, and an accurate acquaintance with scripture. In 1719, he published an Abridgment of the third volume of his father's History of the Reformation. He died in early life. The Gilbert Burnet who abridged the Boylean lectures was a different person. See Boyle's Lectures.

Thomas, the bishop's third son, enjoyed the same advantages of education with his two elder brothers. He was admitted a commoner of Merton college in the university of Oxford, and having studied two years at Leyden, made a tour from France, through Germany, Switzerland, and Italy. Upon his return to England, he devoted himself to the profession of the law, and in early life pursued a course ofdiffutation, which occasioned great uneasiness to his father. At this time, however, viz. in 1712 and 1713, he wrote several political pamphlets in support of the Whigs against the administration of the four last years of queen Anne. One of these pamphlets caused his being taken into custody in January 1713; and in another, entitled "Some new Proofs, by which it appears, that the Pretender is truly James the Third," he gives the same account, in substance, of the Pretender's birth, that was afterwards published in the bishop's History of his own Time. Notwithstanding these literary engagements, he still pursued his wild courses; but one day, being unusually grave, his father asked him what was the subject of his meditation: "A greater work," replied the son, "than your lordship's History of the Reformation;" "what is that, Tom?" "My own reformation, my lord." "I shall be heartily glad to see it," said the bishop, "but almost despair of it." This, however, was happily accomplished after the bishop's decease; and Mr. Burnet became, not only one of the best lawyers of his time, but a very respectable character. After the accession of George I. he wrote a letter to the earl of Halifax on the "Necessity of impeaching the late Ministry," which was followed by "A second Tale of a Tub, &c." being a satire on the earl of Oxford and his ministry. Soon after his father's death, he published "A Character of the right reverend Father in God, Gilbert Lord Bishop of Sarum; with a true Copy of his last Will and Testament." Mr. Burnet was also concerned with others in writing a travesty of the first book of the Iliad, under the title of "Homeries," which gave occasion to Mr. Pope for introducing him into the Dunciad, and in a weekly paper called the "Grunbler." About this time he was appointed his majesty's consul at Lisbon, where he remained for several years. Upon his return, he returned the profession of the law, and rose through several gradations of preferment, in 1741, to the rank of one of the judges of the court of common pleas. He also received the honour of knighthood, and became a member of the royal society. In the court of common pleas he continued, with great reputation, to his death, which happened on the 5th of January 1753. His character was that of an able, upright judge, a sincere friend, a sensible and agreeable companion, and a munificent benefactor to the poor. A remarkable clause in his will, in which he expresses the sentiments of a judicious and candid person, who understood the true nature of Christianity, and who, whilst he gave the preference to the church of England, was persuaded that no religious establishment was entirely free from defects, furnished occasion for some critiques in a serious and sensible pamphlet, entitled "The true Church of Christ, which, and where to be found, &c." Some poetical productions of his youth were published in 1777, 4to.; the characteristic excellence of which is an easy negligence and elegant simplicity.

Besides his Thomas Burnet, there lived in the last century another Thomas Burnet, who was an eminent divine, and author of several valuable publications. He was educated in New College, Oxford, became rector of Wilt, and prebendary of Sarum; and died in May 1750. His four principal works are, "An Answer to Tillotson's Christianity as Old as the Creation;" a "Treatise on Scripture Politics;" a "Course of Sermons preached at Mr. Boyle's Lecture;" and an "Essay on the Trinity," in which last performance he endeavours, with great ingenuity and plausibility, to unite the rationality claimed by the Unitarians, with the orthodox language of those who admit the Athanaian doctrine of the Trinity. Gen. Dicr. Bib. Brit.

Burnet, Thomas, a learned and ingenious divine, erroneously supposed to be a native of Scotland, was born at Croft, in Yorkshire, in 1635, entered, in 1651, at Clarehall, in the University of Cambridge, under the mastership of Mr. John Tillotson (afterwards archbishop of Canterbury), and upon the removal of Dr. Ralph Cudworth from the mastership of that college to that of Christ-college, admitted of that house, and chosen fellow in 1652, and in 1661, senior proctor of the University. After his travels, as tutor to the earl of Wiltshire, and as governor to the duke of Bolton, and the earl of Ormond, afterwards duke of Ormond, he settled at home; and became distinguished as an elegant writer and an acute philosopher. Of his celebrated work, entitled "Telluris Theoria Sacra, &c." the first two books were published in 1680, and the two remaining books in 1689, in 4to. This performance
formance was so much admired on its first appearance in Latin that the author published an English edition of it, in substance the same with the Latin, but newly composed with a variety of additions, in 2 volumes: the first of which was dedicated to king Charles II.; and the second to queen Mary. To the fifth edition, in 1726, is added, the "Author's Defence of the Work from the Exceptions of Mr. Warren, and the Examination of Mr. Keill." Of this theory a particular account will be given in a future article. See Earth. We shall here observe, that though the principles of it have been demonstrated to be erroneous, and it can be regarded only as a beautiful philosophical romance, it was much applauded on its first appearance, and many persons were seduced by the invention and ingenuity displayed in it, and by the elegance of its composition. Among its admirers we may reckon Bayle, who entertained a very high opinion of it, and particularly Mr. Addison, who addressed to the author an elegant Latin poem, in which he has transfused the fancy and sublimity of the original. The mathematicians, however, were not so easily seduced. Mr. Keill attacked it with severity; and Mr. Flamsteed observed concerning it, that "there went more to the making the world than a fine turned paper; and that he was able to overthrow it in one sheet of paper." In 1685 Dr. Burnet was elected, by the interregnum of the duke of Ormond, into the maitership of the Charter-house; and soon after he entered into holy orders. In his situation at the Charter-house he refuted the illegal attempt of king James II. to introduce one Popham, a papist, as a pensioner into that house; and his opposition to him was supported by the other governors, the lord chancellor Jefferyes excepted, so that the king desisted from pursuing the confett. After the revolution, Burnet was appointed chaplain to king William, and through the interregnum of archbishop Tillotson, clerk of the clozet to that prince. In 1692 he published his "Archeologia Philofohica," in which he not only questioned the literal history of the fall, but imputedly introduced an imaginary dialogue between Eve and the Serpent, which gave great offence. So sensible was he of the imprudence of this dialogue, that when a new edition of the "Archeologia" was printing in Holland, he directed that it might be suppressed, and it was likewise omitted in the second edition of the year 1733. To this work was prefixed a dedication to king William, in which the character of that prince is drawn with great strength and elegance. The clergy were so offended by the publication of this work, that it is said to have occasioned his removal from the office of clerk of the clozet; and though he was favoured by king William, and patronized by archbishop Tillotson, the scepticism and heterodoxy charged on his writings prevented his preferment in the church, and particularly his advancement to the episcopal bench, and even to the see of Canterbury, which is said to have been in contemplation. He died September the 27th 1715, and was buried in the chapel of the Charter-house. After his death were published two posthumous treatises: one entitled "De Pide et Officinis Chrillianorum," being part of a larger design, and a valuable compend of Chrilian doctrine and duty, written with a liberal spirit, but not deemed altogether unexceptionable; and the other, entitled "De Statum Mortuorum et Refurgimentum;" to which is added, an appendix, "De Futura Judentorum Reflauratione." In this work the author has given greater scope to his fancy; attacked the doctrine of the eternity of hell-torments; and contended for the final salvation of the whole human race. But so apprehensive was the author left his notions concerning the temporary duration of future punishments should be made an ill ufe of by the bulk of mankind, that in a note to this work, he earnestly protested against its being translated. Dennis, however, in defiance of the author's protestation, not only published a translation of the treatise, but with a fidelity which can hardly be thought a sufficient excuse, for the enormity of it, inserted the note in English at the bottom of the page. Dr. Burnet was also the author of three small tracts in opposition to Mr. Locke, to which was published a reply by Mrs. Cockburne, contained in Dr. Birch's edition of that lady's works. Whatever opinion may be entertained of Dr. Burnet's speculations, philosophical and theological, his style, both in Latin and English, has been universally admired for its elegance and perspicuity. Biog. Brit. Brucker's Hist. Philo. by Enfield, vol. i. p. 484.

BURNET, Thomas, a Scotch physician, educated at Edinburgh, where he arrived at the honour of being fellow of the Royal College, and physician to the king, was author of "Theaurus Medicinae et Practicae ex predillihimorum Medicorum Observationibus collectis," 4to. London, 1672. It has been frequently reprinted, and contains many curious and useful observations. Also, "Hippocrates Contractus, in quo Hippocratis Opera omnia in brevem Epitomem reduci debentur," 8vo. Edinb. 1685. A convenient compendium, with perpetual references to the Opera Omnia. Haller. Bib. Med.

BURNEY, in Agriculture, the name of a plant that may be cultivated in some cafes with advantage, as a green winter food for different sorts of animals. As the providing of a large supply of green food for live flock, especially fattening sheep, eves, and lambs, and for milch cows, during the winter and early spring months, is an object of the greatest importance to the farmer, he should not neglect the culture of such plants as promise to be beneficial in this way; for as turnips, though well adapted to the purpose, cannot be preferred in severe winters, and clover, rye, and other grasses, are not ready sufficiently early: burnet, in such cases, should be attended to in this view. It is not, probably, however, so agreeable a food for animals as that of some other plants, but from its hardening several winters without injury, and being early planted, it may frequently be found highly useful. It succeeds on almost any sorts of soil but those of a strong clayey nature, and may be sown, like other seeds, with corn, and covered by means of a slight harrowing. The produce is in proportion to the goodness of the land. The quantity of feed must be commonly about a bushel to an acre. The author of the New Farmer's Calendar thinks it advantageous to mix burnet with ray-graffs and white clover, or with the latter alone, not only with the view of securing a good bottom, but to render the herbage more palatable to cattle in general, which he has been convinced, by ocular proof, has no great relish for burnet: they, however, become accustomed, he says, to its cucumber-flavour in time, and contented with it; so small inducement to which is, that they are commonly fed with it when no other grass is to be obtained. And Mr. Young observes, that it does well mixed with ray-grass, or cock's-foot, in the proportion of about three pecks of burnet to one of either of the other two. April is recommended as the proper season for sowing burnet with crops of barley or oats, covering it in by two harrowings. It may likewise be sown with buck-wheat in May, with great propriety.

In the raising of crops of this sort much depends upon having good well ripened feed of the true kind, which is always the best provided by collecting it from the best plants by the farmer himself.

When designed for sheep pasture, the best method of sowing this crop is probably that of broadcast over the surface; but in other cares the drill mode may be employed.
Of the falsity of this plant there is, the soil of these writers thinks, "no question; and even its medicinal virtues are confidently spoken of, particularly for sheep suspected of unfoamdumness. It is excellent winter-food for deer and rabbits. Several reasons are to be assigned for the ill success which has attended various attempts to cultivate this grass, as will appear in the following directions. Its chief use is as an early grass, and whilst young, and it must never be given to cattle when old and stalky, nor kept to that flake until intended for hay. In fact, burnet should always be reckoned out of fear when other grass can be had. It never ought to be fed but from January to the end of April; and upon lands proper for it, with judicious management, it will afford pasture even in January. It receives less injury from frosts than any other herbage, and will even grow in the winter months, provided the weather be not too severe. If shut up in April, it will mow at Midsummer; after which it must be reserved for feed until January or February, when, if the weather be favourable, it may be cut and carried to the flock, as in summer, and afterwards fed, but not too clofe, with sheep, until the time of shutting up again. It will produce upwards of a ton of hay per acre, and may be mowed again for feed; but if driven too hard, of course it will not produce so large a quantity of spring-feed as when mowed but once. The value of the feed upon an acre will be from five to ten pounds." But "granting the truth of this account of burnet," continues the same author, "it would be altogether superfluous to enlarge upon its value to a live-flock farmer; but such advantages will ever be looked for in vain upon a cold barren clay, or without the feed's being fresh and good, or without culture and manure, even on a proper soil. One of the first objects is, to be sure the feed be good, which is seldom the case, burnet being a grass very little cultivated, and in which he has been more than once foiled in his endeavours to raise a crop, from that circumstance. It may be further advantageously cultivated in drills, and treated precisely like lucerne, a method which he has lately adopted. It may be sown indifferently either in spring, summer, or autumn. It frequently happens that the crop is thin until the third year, but afterwards very luxuriant, fully covering the soil. It is further observed, that burnet is a native of this country, growing spontaneously in many places, particularly, as he has observed, upon Salisbury Plain, whence he is of opinion, an indication may be drawn of its proper soil: like lucerne, it defies drought in summer, which makes it valuable in another point of view. The feed has been warranted as good food for horses as corn; a consideration for those who may have the convenience of bruising it."

In the twenty-first volume of the Annals of Agriculture we have the following statement of the advantage derived from five roods of wet land, a strong tenacious loam, on a dry and clay-mixt bottom, cut off by ewes and lambs in the beginning of April, besides the straw, which was carefully laid up for winter provision for sheep, in wet weather, and the chaff for horses with their corn, which are reckoned together with a week's keep of fifty sheep, just taken out, as tantamount to the expense of mowing, dressing, and carting.

The land on which burnet is sown should always be made perfectly fine before the feed is put in.

The true management of this crop, according to Mr. Young, is not to cut it down much in the autumn or winter, as the great peculiarity of the plant is to afford a full bite in March; and when you have it fix or eight inches high in October, more food will be found at that period, for it retains its leaves, as the winter frosts have but little effect upon it. "Some," says he, "who have found fault with it, and asserted that it is unprofitable, have fed off the after-grafs bare in the autumn, and let their sheep and cattle get into it in winter. It is then no wonder the burnet does not answer the character given of it by others, who have managed in a different manner."

The crops of this fort which are designed for feed, should be cut about the beginning of July, when care should be taken that it does not feed. It is the best practice to thresh it out in the field in the same manner as many other sorts of small feeds, the straw being made into hay. The produce in both feed and hay is very considerable. When intended for hay, it should be cut rather early in order to prevent its becoming too coarse.

Besides the modes of application, for which it has been already recommended, it is of vast utility as an early spring feed for sheep. The intelligent author of the Farmer's Calendar has observed that, "an acre of it, managed properly, will at this season yield much more food than an acre of clover and rye-grasses."

The importance of the feed and chaff of this plant, as pro- vender for horses, has been highly spoken of by some, but its advantages in this way have not been yet ascertained by any satisfactory set of experiments.

**Burnet, in Botany.** See Poterium and Sanguisorba.

**Burnet Saxifraga.** See Pimpinella.

**Burnet, Burnnet, or Burnetus, in Middle Age Writers,** denotes brown cloth made of dyed wool.

In which sense, the word stands contradistinguishing from brunnus, which was applied to the wool undyed.

**BURNLEY's Island, in Geography,** an island on the north-east coast of Siberia, in the Frozen Sea; about 3 leagues from the main.

**BURNHAM-Market,** a town of Norfolk, in England, has the latter part of its name to distinguish it from other Burnhams in the same county. It is situated near the coast, on the northern extremity of Norfolk. Here was formerly a small monastery of White Friars, or Carmelites, of which Robert Bale was prior. At Burnham-Deepdale are some faint marish, which are found to be very conducive to the fattening and preservation of sheep. On the high grounds along this coast are several tumuli, which some of our topographers attribute to the Saxons and Danes, who were then here during the piracies of the latter. Here is a small weekly market on Mondays, and the parish contains 169 houses, and 743 inhabitants. Burnham-market is 118 miles N. E. of London.

**BURNING,** the action of fire on some pabulum, or fuel, whereby the minute parts thereof are torn from each other, and put into a violent motion; and some of them af- fuming the nature of fire themselves, fly off in orbem, while the
the rest are dissipated in form of vapour, or reduced to ashes. See Combustion.

Burning is also applied to the action of divers things which are cold to the touch, or do not contain fire.

In this sense *aqua fortis* is said to burn cloth. There are certain gases which burn or sear the corn. Virgin observes that severe cold itself will *burn*, that is, have much the same effects on the parts of the body as fire itself, in causing gangrene.

**Burning, extraordinary cases of.**—We have instances of persons burnt by fire kindled within their own bodies. A woman at Paris, who used to drink brandy in excess, was one night reduced to ashes by a fire from within, all but her head and the ends of her fingers. Novum Lumen Phosphorum, accen. Amth. 1717.

Sigory Corn. Zangari, or, as others call her, Corn. Bandi, a lady aged 62, of an unblemished life, near Cenfna in Romagna, underwent the same fate in March, 1751. She had retired in the evening into her chamber, somewhat indisposed, and in the morning was found in the middle of the room, reduced to ashes, all except her face, skull, three fingers, and legs, which remained entire, with the shoes and stockings on. The ashes were light, and, on prefling between the fingers, vanished, leaving a grofs flinking moisture behind, with which the floor was smeared; the walls, and furniture of the room, being covered with a moist cinnarous foot, which had not only flained the linen in the chest, but had penetrated into the closet, as well as into the room over-head, the walls of which were moistened with the same viscous humour. Mem. de l'Ac. an. 1751. p. 1293.

Sig. Mondini, Bianchini, and Maffi, have written discourses express, to account for the cause of fo extraordinary an event: common fire it could not be, since this would have burnt the bed and the room; besides that it would have required many hours, and a large quantity of fuel, to reduce a human body to ashes; and, after all, a confiderable part of the bones would have been left entire, as they were anciently found after the fire before funeral fires. Sig. Mondini attributes this effect to lightning. A philosopher of Verona maintains, that such a confurication might have arisen from the inflammable matters wherewith the human body naturally abounds. Sig. Bianchini accounts for it from an internal fire, occasioned by spirit of wine camphorated, which the lady used by way of bath or lotion, when she found herself out of order. Maffi's system is a combination of the three last: he supposes it owing to lightning, but lightning generated in her own body; agreeable to his doctrine, which is, that lightning does not come from the clouds; but is always produced in the place where it is seen, and its effects perceived. The humours of her body, naturally inflammable enough, were become preternaturally so, by her purdud indisposition; and these, by perspiration, had enveloped her body with an atmosphere of the same kind, replete likewise with mineral matters, whereby its activity was heightened. She had probably riven in the night to ufe her lotion, and, by the friction of her hand, had helped to kindle the flame.

We have various relations of several other persons being burnt to death in this unaccountable manner; as Grace Peas, of Ipswich, aged 69, in 1744; who had previously drank a large quantity of spirituous liquor, and the trunk of whose body was found incinerated, resembling a heap of coals covered with white ashes, and emitting an extremely fetid odour and smoke; and Mary Clues, of Coventry, 52 years of age, in 1772, who had been much addicted to intoxication, so that fearfully a day past in which she did not drink at least a pint of rum or anniseed water. In her cafe no-
phenomenon, and with this view he advances several hypotheses, which it is needless to detail, as the facts are not sufficiently numerous nor well known to admit of establishing a satisfactory theory concerning the spontaneous combustion of human bodies. The author, however, appears to attribute it to a particular state of the fat produced by spirituous liquors; and he founds his opinion principally on the peculiar composition of the persons who have fallen victims to their accidents, and on the observation that has been made, that the parts which were not so fat, such as the extremities of the head, have escaped. And, lastly, he supports his theory by the well-known fact of the spontaneous combustion of a mixture of animal foot and linseed oil, which is a mixture similar to that of a fat body containing charcoal in a very minute state of division.

Burning is also a denomination given by physicians to divers disorders, on account of a fulmination of heat that attends them. In which sense we may a burning fever. See 

Causus.

Among the divers species of madness incident to dogs, one is called the burning madness. If a mare which has been covered, and the colt knit within her, be covered by another horse, he is said to burn her.

Burning is more particularly used for the herpes, or ignis faver, called erysipelas and orchitis.

Burning, among surgeons, denotes the application of an actual cautery, that is, a red-hot iron instrument, to the part affected; otherwise denominated scurvey. See Cautery.

Burning, in antiquity, was a practice much used by the Greeks, Romans, and northern nations; and still retained by many people in both Indies, with respect to their dead. See Burial.

In this sense, burning stands opposite to burying; though, after burning, the bones remaining, and ashes, have been usually collected into urns, and deposited in the earth.

Burning is not so ancient among the Greeks as interring; though we find it obtained in the time of the Trojan war; and it is reported by the choloia on Homer (IIiad. a.) to have been first introduced by Hercules. At and after the Trojan war, burning was generally practised by the Greeks; infomuch that when Lucian (De Leech.) enumerates the various methods used by different nations in the disposal of their dead, he expressly alludes burning to the Greeks, and interment to the Persians. Soerates in Plato's Phaedon, mentions both customs: and it appears, that some of them considered the custom of burning as cruel and inhuman; whence a poet, cited by Eunapius (II. a.) introduces a peron, excoriating against, and calling out upon Prometheus to hate to his affidence, and steal, if possible, from mortals the fire he had given them. Others ascribe the origin of this practice, which prevailed very anciently, not only in Asia, but in the western parts of the world, to respect and friendship for the deceased; whose ashes they deposited in urns, and preferred with great care, and interred with funeral honours. Potier, Arch. iv. cap. 6. tom. ii.

Kings were burnt in cloth made of the albeidos-flame, that their ashes might be preferred pure from any mixture with the fuel, and other matters thrown on the funeral pile. And the like usage is still retained for the princes in Tartary.

Among the Greeks, the body was placed upon the top of the pile, on which were also thrown divers animals, and even slaves and captives, besides unguents and perfumes. In the funeral of Patroclus, we find a number of sheep and oxen thrown in, then four horses, followed by two dogs, and lastly, by twelve Trojan prisoners. Hom. II. xxiii.

To this custom of slaughtering animals, and of condemning slaves or captives to the flames, on occasion of burning the dead, Virgil alludes (Ec. vi. 78. xvi. 92. xi. 197.) and also Cicero (Tusc. 38.). Afterwards gladiators, denominated gladiatorum (which see) were made to fight, as a substitute to human sacrifices. Thus also among the Gauls, slaves and clients were burnt on the piles of their mistresses (see C. xiv. Gall. vi. 172.), and among the Indians and Thracians, wives were burnt on the piles of their husbands; and if one man had several wives, there was sometimes a contest among them, which should be preferred, and the preference was decided by lot. Hirt. vii. 18. Serv. in Ann. v. 95. A similar practice has long existed among the Brahmins of India. See Brahmins. Thus among the Romans, friends testified their affection, as Plutarch to his patron (P. vi. 35.). Plautius to his wife Oeneilla, (Val. Max. iv. 6. 3.) Soldiers to Otho (Tacit. Hist. ii. 40.), and Mnæclus, a freedman, to Agrippina, (Tacit. Annal. xiv. 9.) The body of the deceased was covered with the fat of beasts, that it might the sooner be consumed, it being regarded as a singular blessing to be quickly reduced to ashes. For the same reason, when a number of bodies was arranged to be burnt on the same pile, they blended those of most temperament, and which were easily inflamed, with others: and to this purpose Plutarch (Sympos. l. iii. Quell. 4.) and Macrobius (Saturn. i. vii. c. 7.) observe, that to ten men it was customary to add one woman.

Soldiers usually had their arms burnt with them. The garments worn by the living were also thrown on the pile with other ornaments and presents; a piece of extravagance, which the Athenians carried to so great a length, that some of their law-givers were forced to restrain them, by severe penalties, from defrauding the living by their liberality to the dead.

The pile was set on fire by some of the nearest relations, who prayed and offered vows to the winds to assit the flames, that the body might be quickly consumed. While the body was burning, in the cafe of celebrated commanders, the soldiers and attendants expressed their respect for the dead by making a solemn procession three times round the pile, accompanying their motions with shouts and found of trumpet: and the friends of the deceased filled the pile, pouring forth libations of wine, and calling upon the deceased. When the flames ceased, the remains of the fire were extinguished with wine, and the bones and ashes were collected, sometimes washed with wine and anointed with oil, and sometimes enclosed with fat; and then deposited in urns of gold, silver, wood, stone, or earth, according to the condition of the deceased; those of persons of rank were adorned with flowers and garlands, and sometimes they were covered with cloth till they were lodged in the earth. Homer, i. xxiii. xxiv. Virgil, Ec. vi. Potter, ubi supra.

The Romans, at first, usually interred their dead. See Burial. But they adopted, at an early period, the custom of burning from the Greeks (see Plut. in Numa); and this custom is mentioned in the laws of Numa, and of the twelve tables (Cic. de leg. ii. 22.), but it did not become general, till about the end of the republic. Sylla was the first of the patrician band of the "Gen Cornelia," that was burnt: and he is supposed to have ordered it, lest any one should dig up his body, and dissipate his remains, as he did those of Marus. Pliny (H. N. l. viii. c. 54.).

Eunapius assigns two reasons for the prevalence of burning in Greece; the first, that bodies being thought to be unclean after the soul's departure, were to be purified by fire: and that the soul, or purer part, being separated by the flames, from the gross inactive matter, might take its flight.
flight to the heavenly mansions with more freedom. This latter opinion obtained so much, that the Indian philosophers had no patience to wait for burning till after death; they had recourse to it in their life-time; erected themselves piles for the purpose, to loosen their souls from confinement. Calanus, who followed Alexander out of India, finding himself indisposed, obtained that prince's leave to prevent the growth of his distemper, by committing himself to the flames; and Hercules, before his reception into heaven, was purified from the dregs of earth by the fame means. Quintil. De clar. x. Potter. ubi supra.

Plyni affirms us, that burning was brought into use among the Romans, on occasion of the cruel usage which the bodies of the dead Romans underwent in enemies' countries. But this must only be understood in regard to the common usage, since we find mention of burning as practised by some even in the earliest ages of Rome: Numa forbade his own body to be burned, commanding it to be laid entire in a stone coffin, which shews that the practice of burning was not then unknown at Rome. Under the emperors, as we learn from Tacitus (Annal. xvi. 9.), it became almost universal.

In some cases burning was expressly forbid, and looked upon as the highest impiety. Thus infants who died before the breeding of teeth, were entombed, unburnt; in the ground, in a particular place set apart for this use, called _lagunum._ The like was practised with regard to those who had been struck dead with lightning, who were never to be burnt again, but buried in the spot where they fell, called _bidental_, which see.

Some say, that burning was denied to suicides as a punishment.

The manner of burning among the Romans was not unlike that of the Greeks; the corpse being brought without the city, if they defied to burn it, was carried directly to the place appointed for that purpose; which, by the law of the twelve tables, was without the city: (Cic. de Leg. ii. 23.4.) according to the custom of other nations, as the Jews, (Matt. xxvii. 53. John, xix. 20 and 41.), the Athenians, (Cic. Fam. iv. 12. Liv. xxxi. 24.), and others, (Cic. Placec. xxi. Tufe. v. 23. Plut. in Arat. Strabo, l. x.)

If this place joined to the sepulchre, it was called _busum_, if separate from it, _ufrina_: the body, when brought thither, was laid on the _rogus_, a pile of wood prepared to burn it on, built in shape of an altar, but of different height, according to the quality of the deceased; and at the distance of 60 feet from any house. The wood used was commonly from such trees as contained most pitch or rosin; and if any other were used, they lighted for the more easy catching fire: round the pile they set cypress trees, probably to hinder the noisome smell of the corpse. The body was not placed on the bare pile, but on a couch or bed on which it lay. The eyes of the deceased were opened, (Philo. ii. 37.) to which Virgil is thought to allude, _Aen. iv. 214._ This done, the next of blood performed the ceremony of lighting the pile, which they did with a torch, turning the face all the while the other way, as if it were done with reluctance. During the ceremony, more especially at the funeral of an illustrious commander or emperor, decorations round the pile were performed, with figures inverted, and games were celebrated; after which, when the fire was extinguished, and the embers fanned with wine, came the _oijium_, or gathering the bones and ashes; after washing and anointing them, and repolluting them in urns; which were common to both the Greeks and Romans. Tibull. fab. i. Eleg. i. Virg. _Aen._ lib. vi. Kennet and Potter, lib. cit. It is commonly supposed the practice of burning ceased at Rome under the empire of the Antonines.

The practice, prevalent among the Hindoos, and of which some rare instances still occur, of widows burning themselves on the funeral piles of their deceased husbands, has been already mentioned; (see also the article BRACHMANS.) Mr. Colbrooke, in a paper on the duties of a faithful Hindoo widow, published in the 4th volume of the Asiatic Researches, has collected, from the ancient Sancrit books all the particulars that may serve to elucidate this extraordinary ritual.

"Having first bathed, the widow, dreseed in two clean garments, and holding some _cusa_ grafs, dips water from the palm of her hand. Bearing _cusa_ and _tila_, or leesam, on her hand, she looks towards the east or north, while the Brahmana utters the mystic word _Om_. Bowing to Naraayana, the next declares: "On this month, so named in such a _pasha_, on such f _tithi_, (I naming herself and her family), that I may meet Arunablhi, and reside in Sivate; that the years of my life may be as numerous as the hairs on the human body; that I may enjoy with my husband the felicity of heaven, and sanctify my paternal and maternal progenitors, and the ancehly of my husband's father; that raised by the _Aspara_, I may be happy with my lord, through the reigns of 14 _Indras_; that expiation be made for my husband's offences, whether he has killed a Brahmana, broken the ties of gratitude, or murdered his friend: thus I ascend my husband's burning pile. I call on you, ye guardians of the eight regions of the world! Sun and moon! Air, fire, earth, and water! My own soul! Yama! Day, night, and twilight! And thou, confluence, bear witnesses: I follow my husband's corpse on the funeral pile!" Having repeated the above declaration, called the _Sancalpa_, the walks thrice round the pile; and the Brahmana utters the following Mantras: "O! Let these women, not being widowed good wives, adorned with collyrium, holding clarified butter, confine themselves to the fire. Immortal, not childless, nor husbandless, excellent, let them pass into fire, whose original element is water." From the _Rigveda_:

"O! Let these wives, pure, beautiful, commit themselves to the fire with their husband's corpse," _A puránīca mantra._

With this benediction, and uttering the mystic _Namo Namah_, she ascends the flaming pile. While the preferred ceremonies are performed by the widow, the son, or other near kindred, of the deceased, applies the first torch with the forms directed for the funeral rites in the _Grihya_ (extracts or compilations from the sacred books); by which his tribe is governed. The last rites in this tragic scene, as we may call it, but not so deemed by those who practise them, are as follow: "Adorned with all jewels, decked with didmil and other ornamental ornaments, with the box of _minum_ in her hand, having made _pājā_ or adoration to the _Dvādāśa_, thus reflecting that _this life is nought; my lord and master to me was all_; she walks round the burning pile; the beftows jewels on the Brahmanas, comforts her relations, and gives her friends the attentions of civility; while calling the fun and elements to witners, the distributes _minum_ at pleasure; and having repeated the _Sancaalpas_, proceeds into the flames; there embracing the corpse, she abandons herself to the fire, calling _Satiya! Satiya! Satiya!_ The by-roaders throw butter and wood on the pile, which is reckoned an act transcendently meritorious, and even those who join in the procession are rewarded in heaven for every step of their march. Such liberal immunities are a proof, says Mr. Colbrooke, that burning could never be a frequent practice in the east.

The sacrifice above described is not absolutely enjoined; but it is recommended by all the allurements which enthusiasm can invent. There are, however, some cases of exemption. If the widow has an infant child; or if she is pregnant; and, among certain calls, if the husband dies in a distant...
diftant country, the ceremony is interdicted. But if the woman declines burning, for he is allowed the alternative, the muff thenceforth live a life of the most rigid austerity, and devote herself wholly to acts of piety and mortification. But through the alternative be allowed, the Hindu legislators have shown themselves disposed to encourage widows to burn themselves with their husband's corpse.

Mr. Campbell, during his stay at Tanjore, was a spectator of this horrid ceremony; performed by a young widow, not more than 16 years of age. He has minutely described all the circumstances attending it: for an account of which we refer the reader to his "Journey over Land to India," 410. 1795.

Burning alive, among the Romans, a punishment inflicted on defectors, betrayers of the public councils, incendiaries, comedians, and even Christians: it was called crematio.

The Jews had two ways of burning: one called burning of the body, performed with wood and faggots; the other, burning of the soul, combusio animae, performed by pouring scalding hot lead down their throats. The priest's daughter, who committed whoredom, he that lay with his own daughter, or grand-daughter, or his mother-in-law, were burnt alive. Phil. Trans. N° 230. Godw. Mofes & Aaron, lib. v. cap. 7.

Burning, Ufio, in Chemistry, is distinguished from calcining; as the former is performed in close vials, and terminates in charring, or reducing the body to a blackness; whereas the latter turns then white, being performed in the open air. It also differs from roasting, rofio, as, in burning, the fire is applied in contact with the body; in roasting, at a distance from it.

Burning, or Brenning, in our Ancient Customs, denotes an infectious local disease, obtained by intercourse with the lewd women who were kept in the public stews. See Stews.

Mr. William Beckett, a surgeon of great learning in this branch of history, has left us a curious account of the burning, which was published in a letter to Dr. James Douglas, A. D. 1718. Mr. Beckett has certainly failed in proving the antiquity of lues venera or syphillis; but the information contained in his letter is too much to our present purpose to be wholly omitted. We shall, however, resume this investigation when we describe the origin of the venereal disease: intending, in the article before us, to give only an extract from Mr. Beckett's interesting letter; viz.

"I shall begin with the first degree of this disease, and prove, from authentic evidences, it was anciently called the burning or burning; and that this word has been successively continued for many hundreds of years, to signify the same disease we now call a clap; and that it was not discontinued till that appellation first began to have its rite. The most likely method to accomplish my design, will be first to examine those records that relate to the plagues which were by authority allowed to be kept on the Bank-Side in Southwark, under the jurisdiction of the bishop of Winchester, and which were suppressed the 37th of Hen. VIII. For it is impossible but, if there were any such disease in being at that time, it must be pretty common among those lewd women who had a licence for entertaining their paramours, notwithstanding any rules or orders which might be established to prevent its increase: but if we shall find that there were orders established to prevent the spreading of such a disease, that persons might be secure from any contagious malady after their entertainment at those houses, (which were anciently 18 in number, but in the reign of Hen. VII. reduced to 12), we may then securely depend upon it, that it was the frequency of the disease that put those who had the authority under a necessity of making such rules and orders. For the same powers, who granted a liberty for keeping open such lewd houses, must find it their interest to secure, as much as possible, all persons from receiving any injury there; lest the frequency of such misfortunes should deter others from frequenting them, and so the original design of their institution cease from the entire linking of the revenues. Now I find that, as early as the year 1162, divers constitutions relating to the lordship of Winchester, (being also confirmed by the king), were to be kept for ever, according to the old customs that had been time out of mind. Among which these were some, viz. 1. No flwo-hole to take more for a woman's chamber in the week than 14d. 2. Not to keep open his doors upon holy days. 3. No single woman to take money to lie with any man, except she lie with him all night till the morning. 4. No flwo-hole to keep any woman that hath the perils of infirmity of burning. These and many more orders were to be strictly observed, or the offenders to be severely punished. Now we are assured, there is no other disease that can be communicated by carnal conversation with women, but that which is venereal, by reason that only is contagious; and it is evident the burning was certainly so: for, had it been nothing else but some simple ulceration, heat, or inflammation, there would have been no contagion; and that affecting only the woman, could not be communicated by any venereal congers, and so not infer a necessity of her being comprehended under the restraining article. These orders likewise prove the disease was much more ancient than the date above mentioned; because they were only a renewal of such as had been before established time out of mind.

"But to confirm this farther, I find that in the custody of the bishop of Winchester, whose palace was situated on the Bank-side, near the flews, was a book written upon vellum, the title of which runs thus: "Here begynneth the ordinances, rules, and customs, as well for the salvation of mannes life, as for to acheshow many mischiefes and inueniences that daily be likethere for to fall out, to be rightfully kept, and due execution of them to be done unto any person within the same." One of the articles begins thus: "De his qui cullidiont mulieres habentes nepahandam inimicatim." It goes on, item, "That no fles-hold keeper noo woman within his house, that hath any sicknes of brening, but that she be put out upon the payne of makeit a fine unto the lord of a hundred shillings." This is taken from the original manuscript, which was preserved in the bishop's court, supposed to be written about the year 1430. From these orders we may observe the frequency of the distemper at that time; which, with other inveniences, was daily like there for to fall out: and the greatnes of the penalty, as the value of money then was, that is laid on it, proves it was no trifling or insignificant thing.

"But the bare proof of there having been anciently such a disease as was called the burning, may be thought to be insufficient, unless we were perfectly aflured what it was, and how it was in those times describ'd: I shall therefore do it from an unquestionable authority, which is that of John Arden, esq.; who was one of the surgeons to king Richard I. and likewise to king Henry IV. In a curious manuscript of his upon vellum, he defines it to be, a certain inward heat and excoriatiion of the urethra; which description gives us a perfect idea of what we now call a clap; for frequent dipherings of those who laboured under that disease have made it evident, that their urethra is excoriated by the virulence of the matter they receive from the infected woman; and this excoriatiion or ulceration is not confined to the
of the vulva, or mouth of the glansule mucosa, as has been lately thought, but may equally arise from any part of the urethra not beyond the reach of the impelled malignant matter. The heat is more described, which these perils are formidable, as well now as in the remote, is a confection of the excoriated urethra; for the fillets contained in the urine must necessarily prick and irritate the nervous fibres, and excite a heat in those parts of the urethra which are divided of its natural membrane; which heat will always be observed to be more or less, as the fillets are diluted with a greater or less quantity of urine; a thing I have often observed in persons who have laboured under this infirmity in hot weather, when the perceptible matter being thrown off in greater quantities, the fillets bear a greater proportion to the quantity of urine, and thereby make its discharge at that time so much the more painful and troublesome.

Thus we see this very early and plain description of this disease among us to be entirely conformable to the late and most exact anatomical discoveries. Here is no tone of the teinelines deprived, according to Trajanus Petronius; no excoriation of the peridilate, according to Rondelous; no ulceration of the venereal vessels, according to Plutarchus; no spot of the disease in the vesicula femoritis, or peridilate, according to Bartholin; nor in those parts and the teinelines at the same time, according to our countryman Wharton, and others, who have falsely fixed the seat of this disease, and whose notions, in this respect, are now justly exploded; but a single and true description of it, and its situation, about 150 years before any of those gentlemen obliged the world with their learned labours.

Having, I hope, sufficiently made it appear, the burning was a disease very early among us, and given the description of it, I shall proceed to say something of the ancient method that was made use of to cure it. We are not to expect the measures our predecessors in those early times made use of, should be calculated for the removing any malignity in the walls of blood, or other juices, according to the practice in general cases at this time; because they looked upon the disease to be entirely local, and the whole of the cure to depend upon the removal of the symptoms. Hence it was they recommended such remedies as were accommodated to the taking off the inward heat of the part, and cure the excoriations or ulcerations of the urethra. The proceeds for the accomplishing of this, I shall set down from the before-mentioned John Arden, who wrote about the year 1580. His words are as follows: "Contra incendium. Item contra incendium virgum virilium internis: ex calore & excoriationes, a subtituis (i.e. invenio) levitas. Accepit lac milium, mollium nutrivitum, & parum zucarum, oleum viio & phialum; quibus commixtis per fiamam inflamatur, & si pravetix eunuculatus & amigdalarum melior erit medicina." There is no doubt but this remedy, being used to our patients at this time, would infallibly take off the inward heat of the part, and cure the excoriations or ulcerations of the urethra, by which means what is infected from thence would be entirely flopt: and this was all they expected from their medicines, for as much as they were entirely unacquainted with the nature of the disease; and did not in the least imagine, but if the symptoms that first attacked the part were removed, the patient was entirely cured.

I shall now, as a farther confirmation of what I have advanced, proceed to prove, that by this burning or burning is meant the venereal disease, by demonstrating that succeeding historians, physical and chirurgical writers, and others, have all along with us in England used the very same word to signify the venereal malady. In an old manuscript I have, written about the year 1590, is a receipt for "burning of the pynst, yet men elate ye apeagall," galle being an old English word for a running sore. They who know the etymology of the word gnst, cannot be ignorant of this.

And in another manuscript, written about 50 years after, is a receipt for burning in that part by a woman. Simon Fins, a zealous promoter of the reformation, in the reign of Henry VIII., in his supplication of beggars, entitled to the king, in 1536, says as follows: "Thou be they," speaking of the Romish priests, "that corrupt the whole generation of mankind in your realm; that catch the pockes of one woman and bear them to another; that be burnt with one woman and bear it to another; that catch the leprosy of one woman and bear it unto another." But to make this matter still more evident, I am to observe, that Andrew Boord, M. D. and Romish priest, in the same reign, in a book he wrote, entitled "The Brevisst of Health," printed in 1546, speaks very particularly of this sort of burning; one of his chapters begins thus: "The 16th chapter doth shew of burning of an harlot!" where his notion of communicating the burning is very particular. He adds, that if a man be burnt with an harlot, and do meddle with another woman within a day, he shall burn her: and as an immediate remedy against the burning, he recommends the washing the pudenda two or three times with white wine, or else with salt and water; but if the matter have continued long, to go to an expert surgeon for help. In his 82d chapter, he speaks of two sorts of burning, the one by fire, and the other by a woman, through carnal copulation, and refers the person that is burnt of a harlot to another chapter of his for advice, "if he get a dorser or two," so called from its protuberancy or, bunching out: for I find about that time the word bubo was mostly made use of to signify that sort of swelling which usually happens in pellisumal diseases.

From hence it appears, the burning by its consequents, was venereal. Since every day's experience makes it evident, that the ill treatment of the first symptoms of the decease, either by allurging medicines, or the removing them by cooling and healing the excoriated parts, will generally be attended with such swellings in the groin, which we rarely observe to happen from any other cause whatsoever.

I shall give a few more instances of this decease being called the burning, and conclude. In a manuscript I have of the vocation of John Bale to the bishoprick of Ossory in Ireland, written by himself, he speaks of Dr. Hugh Wellon, who was dean of Windor, in 1556, but deprived by cardinal Pole for adultery, as follows, "At this day is licentious Wellon, who is more practised in the art of brech-burning than all the whores of the flies." And again, speaking of the same person, he says, "He not long ago burnt a beggar in St. Doloph's parish." The same author says of him elsewhere, "He had been sore bitten with a Wineheller goose, and was not yet healed thereof," which was a common phrase for the pox at that time, because the flies were under the jurisdiction of the bishop of Wineheller. Mich. Wood, in his epistle before Stephen Gardiner's oration, "De vera Obedientia," printed at Rhoa, 1552, gives another evidence of the burning. And William Bullein, a physician in the reign of queen Elizabeth, in a book he published, called "The Bulwark of Defence, &c." printed in 1562, bringing in Sickneps demanding of Health what he should do with a decease called the "French Pockes," Health answers, "He would not that any should "fithe for this decease, or to be bold when he is bitten, to thynke thereby to be helped, but rather to efchewe the "caufe of thy sighing, and filthy rotten burning of "harlotes."
In the Sloaniom library, No. 4637, is another letter, (bound up in folio, with a great many different MSS.) from Mr. William Beckett to Sir Han Sloane, dated Feb. 4th 1735; wherein the principal facts mentioned in the letter to Dr. Douglass are recited. But we found nothing besides which is worthy of notice, except the following remark:—

"This burning or burning, (being, upon the diffuse of these words, called gomorrhia,) is what we now call the elop:—

which word I take to be of a modern usage; for, in all my enquiries, I cannot find that it was ever designed to signify the same thing it does now, before the reign of Charles I."

_Burning, in Law._ See _Arson, Branding, Treason, &c._

_Burning of diamonds_, is used among the jewellers for putting the diamonds into a fierce fire, in order to divest them of a yellow or brown colour.

_Burning on the forehead, Prato, instar_, was anciently the penalty of a calumniator. In the middle age, we find frequent instances of burning in the cheek; a punishment allotted to bondmen, or villains guilty of theft.

_Burning-beds._ See _Bush._

_Burning-glares, or burning-mirror_, a machine whereby the sun's rays are collected into a point; and by that means their force and effect extremely heightened, so as to burn objects placed therein.

_Burning-glares are of two kinds_: the first convex, called _lentes cangiia_, which transmit the rays of light, and in their passage refract, or incline them towards the axis; having the properties of _specula_ or mirrors; and acting according to the laws of refraction.

The second, which are the more usual, are concave; very improperly called burning-glares, being usually made of metal; these reflect the rays of light, and, in that reflection, incline them to a point in their axis; having the properties of _specula_ or mirrors; and acting according to the laws of reflection. See _Mirror and Reflection._

The first, or convex kind, authors suppose to have been unknown to the ancients; but the latter they are generally allowed to have been acquainted with. Their magnifying power is taken notice of both by Seneca and Pliny, and their burning power is mentioned in a treatise of Optics, ascribed to Euclid, theorem 31. It is probable that the Romans had a method of lighting their sacred fire by means of reflecting concave _specula_. But Porta, and many others, suppose, that the burning mirror of the ancients were made of metal, in the form of a section of a parabola, having the vertex cut off; it being the well-known property of this curve to reflect all rays that fall upon it parallel to the axis into the focus. Historians tell us, that Archimedes, by means of reflecting mirrors, burnt a whole fleet; and though the effect related be very improbable, yet it sufficiently proves, that such things were then known. The machines then used, nobody doubts, were metallic and concave, and had their focus by reflexion; it being agreed, that the ancients were acquainted with the refracted _foci_ of convex glazes.

Yet M. de la Hire has discovered even these in the Clouds of Aristophanes; where Strepheades tells Socrates of an expedition he had to pay his debts, by means of a round transparent stone or glafs, used in lighting of fires, by which he intended to melt the bond; which in those days was written on wax. The glafs here used to light the fire, and melt the wax, M. de la Hire observes, could not be concave; since a reflected _focus_ coming from below upwards, would have been exceedingly improper for that purpose: and the old scholiast of Aristophanes confirms the sentiment. Pliny makes mention of globes of glafs and crystal, which being exposed to the sun, burnt the clothes and flesh on people's backs; and Lactantius adds, that a glafs sphere, full of water, and held in the sun, lighted the fire even in the coldest weather; which incontrovertibly proves the effects of convex glazes.

Indeed, there is some difficulty in conceiving how they should know such _glases_ burnt, without knowing they were magnified; which it is granted they did not, till towards the close of the thirteenth century, when spectacles were thought of. For as to those palleages in Plautus, which seem to intimate the knowledge of spectacles, M. de la Hire observes, they do not prove any such thing; and he solves this, by observing, that their burning glases being spheres, either fold, or full of water, their _foci_ would be one fourth of their diameter distant from them; if then their diameter were supposed half a foot, which is the molt we can allow, an object must be at the distance of an inch and an half, in order to its being perceived magnified; those at greater distances do not appear greater, but only more confused, through the glas than out of it. It is no wonder, therefore, the magnifying property of convex glases was unknown, and their burning one known; it is more wonderful there should be 300 years between the invention of spectacles and telecopes.

Every concave mirror, or _speculum_, collects the rays diffused through its whole concavity, after reflection, into a point or focus; and is therefore a burning mirror.

Hence, as the focus is there where the rays are the most closely contracted, if in a segment of a spheric, its breadth must not subtend an arch above eighteen degrees: if it be a segment of a smaller sphere, its breadth may be thirty degrees; which is verified by experiment. As the surface of a mirror, which is a segment of a larger sphere, receives more rays than another of a less, if the latitude of each subtend an arch of eighteen degrees; or even more or less, provided it be equal; the effects of the greater mirror will be greater than those of the less.

And, as the _focus_ is contained between the fourth and fifth parts of the diameter, mirrors that are segments of greater spheres burn at a greater distance than those which are segments of a smaller.

Since, lastly, the burning depends on the union of the rays, and the union of the rays on the concave spherical figure; it is no wonder, that even wooden mirrors, gilt, or those prepared of alabaster, _&c._ covered with gold; nay, even that those made of paper, and covered with straw, should be found to burn.

Among the ancients, the burning mirrors of Archimedes and Proclus are eminent; by one of which, the Roman ships besieging Byzantium, under the command of Marcellus, according to the relation of Zonaras, Tzetzes, Galen, Euclitthus, Anthimius, _&c._ and by the other, the navy of Vitalian besieging Byzantium, according to the same Zonaras, were burnt to allies.

Many have questioned the fact recorded by several historians concerning the surprising effects of Archimedes's burning mirrors; and they have principally urged the impossibility of producing such effects by means of concave _specula_, the focal distance of which must have been much too small for the purpose. Des Carteres, particularly, discredited the story, as fabulous, on this account; but Kircher made many experiments with a view of vindicating its credibility. Apprehending that the concave _specula_ of the ancients were sections of a parabola, he began with combining several of this figure; but, failing of success in this way, he tried the effect of a number of plane mirrors; and with five mirrors of the same size, placed in a frame, he contrived to throw the rays
rays reflected from them to the same place, at the distance of more than a hundred feet; and by their means he produced such a degree of heat, as led him to conclude that, by increasing their number, he could have set fire to inflammable substances at a greater distance. He likewise made a voyage to Syracuse, in company with his pupil Schottius, in order to examine the place of the supposed transmutation; and they were both of opinion that the galleys of Marcellus could not have been more than thirty paces from Archimedes. M. Buffon, though ignorant of the particular testimonies of ancient writers, relative to the invention of Archimedes, and of the attempts of Kircher above mentioned, has more lately, by a similar contrivance, sufficiently evinced the practicability of the operation.

Dr. Wolfe, in the year 1768, after having given an account of some parabolic mirrors, constructed by M. Hoe- fen of Dresden, offers a conjecture, that those of Archimedes might be of this kind, since it is not difficult to describe a parabola, whose parameter is 2000 feet; and that rays reflected from such a speculum might be received by a lens, after having been brought to a focus, and transmitted parallel to any distance: but he was not apprized, that Kepler and Descartes had shewn, that no rays could be conveyed parallel to one another, except those which proceeded from the same points in the sun's disk. Dutens du Miroir Ardent d'Archimede. Paris, 1755. Phil. Trans. vol. xviii. p. 621, &c. Ibid. vol. ix. p. 8.

Among the moderns, the most remarkable burning mirrors are those of Magine, twenty inches in diameter; of Septula of Milan, which was near three feet and a half in diameter, and which burnt at the distance of fifteen or sixteen paces; of Villette, and Thérimhaufen, the new complex one of M. Buffon, that of Trudaine, and that of Parker.

Villette, a French artist at Lyons, made a large mirror, which was bought by Tassigny, and presented to the king of Peria; a second, bought by the king of Denmark; a third, presented by the French king to the Royal Academy; a fourth has been in England, where it was publicly exhibited. — The effects of this mirror, as found by Dr. Harris and Dr. Defaguller, are, that a silver spexence is melted in 7" and 3"; a halfpenny of gold 1" in 16", and running with a hole in 34". Tin melts in 3", cast iron in 16", flate in 3"; a foible shell calcines in 7"; a piece of Pompey's Pillar in Alexandria vitrifies in the black part in 50", in the white in 54"; copper one in 8"; bone calcines in 4", and vitrifies in 33". An emerald melts into a substance like a turquois stone; a diamond weighing four grains, loses 2 of its weight; the albello vitrifies; as all other bodies will do, if kept long enough in the focus; but when once vitrified, the mirror can produce no farther effect. — This mirror is forty-seven inches wide; and is ground to a sphere of seventy-six inches radius; so that its focus is about thirty-eight inches from the vertex. Its substance is a composition of tin, copper, and tin-gla.s. Phil. Trans. vol. iv. p. 198.

M. Thérimhaufen's reflecting mirror deserves next to be mentioned. The following things are noted of it in the Acta Eruditum, for 1697, p. 52.

1. Green wood takes fire inflammantly, so that a strong wind cannot extinguish it.
2. Water boils immediately, and eggs in it are presently edible.
3. A mixture of tin and lead, three inches thick, drops presently, and iron or steel-plate becomes red hot presently, and a little after burns into holes.
4. Things not capable of melting, as bones, bricks, &c. become soon red hot, like iron.
5. Slate becomes first white, then a black gla.s.
6. Tiles are converted into a yellow gla.s, and shells into a blackish yellow one.
7. A purific-fo.me emitted from a Vulcano, melts into white gla.s; and, A piece of crucible also vitrifies in eight minutes.
8. Bones are soon turned into an opaque gla.s, and earth into a black one. It is made of copper, and its substance is not above double the thickness of the back of a knife; this was about 4 French feet in diameter, and it burnt at the distance of twelve feet.

Every lens, whether convex, plano-convex, or convexo-convex, collects the sun's rays, dispersed over its convexity, into a point by refraction; and is therefore a burning glass. The most considerable of this kind, known, is that made by M. de Téchinhausen: the diameters of his lenses are three and four feet; the focus at the distance of twelve feet, and its diameter an inch and a half. To make the focus more vivid, the rays are collected a second time by a second lens parallel to the first; and fitted in that place where the diameter of the cone of rays formed by the first lens is equal to the diameter of the second; so that it receives them all: and the focus from an inch and a half, is contracted into a space of eight lines, and its force increased proportionally. This was purchased by the duke of Orleans, who presented it to the French Academy. Its weight was 160 pounds.

Its effects, among others, as related in the Acta Erudit. Liptae, are, that it lights hard woods, even moistened with water, into a flame, instantly; that water, in a little vessel, begins to boil presently; all metals are melted; brick, pumice-stone, delict woods, and the albeLlos fume, are turned into gla.s; sulphur, pitch, &c. melted under water; the ashes of vegetables, woods, and other matters, tranmuted into glas; in a word, every thing applied to its focus, is either melted, turned into cals, or into smoke; and the colours of jewels, and all other bodies, metals alone excepted, are changed by it. He observes, that it succeeds best when the matter applied is laid on a hard charcoal, well burnt.

Though the force of the solar rays be here found to stupendous, yet the rays of the full moon, collected by the same burning gla.s, do not exhibit the least increase of heat.

Wolius tells us, that an artist of Dresden made burning mirrors of wood, bigger than those of M. Thérimhaufen or Villette, which had effects at least equal to any of them. — Traberus teaches how to make burning mirrors of leaf gold, viz. by turning a concave, laying its inside equally with pitch, and covering that with square pieces of the gold, two or three fingers broad, fastening them on, if need be, by fire. He adds, that very large mirrors may be made, of thirty, forty, or more concave pieces, artfully joined in a turned wooden dish or feutre; the effects of which will not be much less than if the surface was continuous. — Zahnius adds farther, that Newman, an engineer at Vienna, 1699, made a mirror of plate-board, covered within with straw glued to it; by which all kinds of metals, &c. were readily melted.

Sir Isaac Newton's burning mirror consisted of seven concave gla.ses, each of which was eleven inches and a half in diameter, and so disposed as to have one common focus: six of them were placed round the seventh and contiguous to it, in such a manner as to form the segment of a sphere, whose subtense is about thirty-four inches and a half; the focus is about twenty-two inches and a half distant, and about an inch in diameter. This speculum vitrified brick or tile in one second, and in about half a minute melted gold. M. Zeller, not long since, made some improvement of this instrument; and formed panes of plain gla.s into the necessary degree of curvature, by heating them so hot on a dish made of metal, that they could all assume the same form. M. Buffon has constructed furnaces for converting plain into concave mirrors; the mirrors are exposed to a degree of heat sufficient to soften the gla.s, in conformance of which it conforms itself to the spherical figure of the mould on which it is placed. This method is subject to many difficulties and
accident; however, out of twenty-four mirrors treated thus, M. Buffon preserved three; two of which are thirty-seven inches in diameter, and the other forty-fix inches. The last was tin-sheeted, and presented to the French king; and is represented by the maker, as the most powerful burning mirror in Europe, and yet the moon's light reflected from the concave surface, on a thermometer placed at the focus, produced no sensible dilatation of the included fluid. M. Buffon has also made attempts for constructing convex lenses of great power, by fixing two of the above mentioned concave glasses together, and filling the cavity between them with water; one of the glasses broke in the trial; but others have since undertaken to construct these water lenses. He has likewise suggested another improvement in the construction of burning glasses, confining it in a contrivance for diminishing the thickness of the middle or central part of the lens, from three inches to one inch; whereby he proposes to prevent the diminution of light occasioned by its passing through the middle part of a lens of large diameter, and short focus, which must be proportionably thick in that part. This new kind of lens is composed of three parts ground to the same radius, or of two circular zones, or bands, surrounding a central or middle part. He computes that the heat in the focus of a lens of this kind, three feet in diameter, will be about four times greater than that produced by any burning glass; yet known.

But the most considerable improvement which M. Buffon has introduced into the optical apparatus is his machine, consisting of a number of mirrors; whereby he seems to have revived the secret of Archimedes, and to have vindicated the credit of history in this point. In the year 1747 he constructed a machine, with a hundred and forty plane mirrors, each about four inches long, and three broad; these are fixed at about a quarter of an inch distance from each other, upon a large wooden frame of about six feet square. Each of these has three moveable ferses, which are so contrived, that the mirror can be inclined to any angle, and in any direction that meets the sun; and by this means, the solar image of each mirror is made to coincide with all the rest. The experiment was first tried with twenty-four mirrors, which readily set on fire a combustible matter, prepared of pitch and tow, and laid on a deal board, at the distance of sixty-fix French feet. He then farther pursu ed the attempt, and put together a kind of polyhedron, consisting of 168 pieces of plane looking glasses, each being fix inches square; and by means of this frame boards of beech-wood were set on fire, at the distance of a hundred and fifty feet, in the month of March, and a silver plate was melted at the distance of sixty feet. This machine, beside other advantages, may be easily moved, so as to burn downwards or horizontally; and it burns either in its distant focus, or in any nearer interval, which our common burning-glasses cannot do, because their focus is wholly fixed and determinate. This machine, in the next stage of its improvement, contained three hundred and sixty plane mirrors, each eight inches long, and six broad, mounted on a frame eight feet high, and seven feet broad. With twelve of these mirrors, light combustible matters were kindled at the distance of twenty feet; at the same distance, a large tin vessel was melted with forty-five of them, and a thin piece of silver with a hundred and seventeen. When the whole machine was employed, all the metals and metallic minerals were melted at the distance of twenty-five, and even of forty feet. Wood was kindled in a clear flask, at the distance of two hundred and ten feet. The focus, at the distance of fifty feet, is about seven inches broad; and at the distance of two hundred and forty feet, it becomes two feet in diameter. Mr. Buffon afterwards constructed a machine, which contained four hundred mirrors, each half a foot square, with which he could melt lead and tin at the distance of a hundred and a forty feet. Phil. Trans. ab. vol. x. p. 104. &c. M. de Buffon Histoire Naturelle. &c. Supplém. vol. i. Montucla, Histoire des Mathématiques, vol. i. p. 532.

There is no solid substance that reflects the efficacy of modern burning-glasses. Melfs, Macquer and Bayrre have succeeded in melting small portions of platinum, by means of a concave glass, twenty two inches in diameter, and of twenty-eight inches focus; though this metal is not fusible by the strongest fires that can be excited in furnaces, or fusible by any chemical apparatus. Yet it was long ago observed by the Academicians del Cimento, that spirit of wine could not be fixed by any burning glass which they used; and notwithstanding the great improvement which these optical instruments have since received, M. Nollet has not been able, by the most powerful burning mirrors, to set fire to any inflammable liquors whatever.

The principle upon which M. Trudaine constructed his burning lens was that of combining two circular segments of glasses spheres, and applying them with their concave faces towards each other, to as to form a lenticular cavity of four feet in diameter. The cavity was filled with spirits of wine; of which it contained 1,50 French pints. The focus of parallel rays in this instrument was 10 feet 12 inches and one line distant from the centre of the glass; and originally contracted to a circle of about eight lines in diameter, by the interposition of a second and smaller lens of solid glass. The maker presented it to the Royal Academy of Sciences, but it was soon afterwards accidentally broken. The expense of its construction is said to have amounted to 10001. sterling; and yet its powers were not very great; for, according to Mr. Magellan, it required 60 minutes for converting the particles of platinum, which Mr. Parker's lens could do in less than a tenth part of the time. This seems indeed to be the most powerful burning lens that has yet been constructed. Mr. Parker, of Fleet-street, London, was induced, at an expense of upwards of 700L., to contrive and at length to complete a large transparent lens, that would serve the purpose of furnishing and vitrifying such substances as reflect the fires of ordinary furnaces, and more especially of applying heat in vacuo, and in other circumstances in which it cannot be applied by any other means. After directing his attention for several years to this object, and performing a great variety of experiments in the preparation of it, he at last succeeded in the construction of a lens, of flint glasses, three feet in diameter, which, when fixed in its frame, exposes a surface two feet 3 inches in the clear; without any other material imperfection besides a disfigurement of one of the edges by a piece of the scoria of the mould, which unfortunately found its way into its substance. This lens was double convex, both sides of which were a portion of a sphere of 18 feet radius. From the papers and drawings, with which the ingenious inventor has obligingly furnished us, we are able to give the following accurate account of this lens, illustrated by appropriate engravings. The elevation of this lens is exhibited in Plate II. Optics. fig. 1. The large lens is A, whose diameter in the frame is 3 feet, and in the clear 2 feet 8 inches; its thickness at the centre is 3 inches; its focal distance is 6 feet 8 inches; and the diameter of the burning focus 1 inch; its weight was 212 pounds. B is a second lens, whose diameter in the frame is 16 inches, and which shews in the clear 13 inches; the thickness in the centre is 1 inch; length of the focus 29 inches, and its diameter 3 of an inch;
its weight 21 pounds. When the two above lenses are compounded together, the length of the focus is 5 feet 3 inches, and its diameter half an inch. C is a truncated cone, composed of 12 ribs of wood, at the larger end of which is fixed the great lens A, and at the smaller extremity the lesser lens B; near the smaller end is also fixed a rack, D, passing through the pillar L, movable by a pinion turning in the fixed pillar, by means of the handle E, and thus giving a vertical motion to the machine. F is a bar of wood, fixed between the two lower ribs of the cone at G; having, within a chafed mortice in which it moves, an apparatus, H, with the iron plate I, fixed to it; and as this part turns on a socket, K, a method is thus obtained of placing the matter under experiment so as it may be acted upon by the focal rays in the most direct and powerful manner. L L is a strong mahogany frame, moving on castors, M M, and immediately under the table, N N, are three friction wheels, by which the machine moves horizontally. O is a strong iron bow, in which the lens and the cone hang.

In fig. 2, a section of the large lens is seen: a, the large lens, marked A in the former figure; b b is the frame which contains the lens; c the small lens, marked B in the preceding figure; d d is the frame which contains this lens; e e is the truncated cone, marked C in the other figure; f is the bar, on which the apparatus, marked F in the former figure, moves; g is the iron plate, denoted by I in the fixed figure; h the cone of rays, formed by the refraction of the great lens a, and falling on the lens c; and i is the cone of rays formed by the refraction of the lens c. In fig. 3, L L exhibits the front view of the great lens; L L the frame containing the large lens; and L M the strong iron bow in which the lens hangs.

It is difficult to form an accurate estimate of the burning power of this lens; inasmuch as it is next to impossible to discover what should be deducted for the loss of power, in consequence of the impediments that the glases of which it was made might occasion, as well as the four reflections (i.e. two reflections on the immersion, and two more on the emission of the rays of heat), by way of diminution; but we will endeavour to appreciate it after making a full allowance for these deductions, which must necessarily result from every means of concentrating the solar rays, and which must be considered to be as the fraction of an engine, of which nature they really partake.

The solar rays received on a circular surface of 2 feet 8½ inches, when concentrated within the diameter of one inch, will be 1056.25 times its intensity, or this number of times greater than the heat of the sun as felt on the surface of the earth. We will suppose that as the heat of the air, in ordinary summer weather, is 65°, and in sultry weather is 75°, the average of which is 70°, and that we take this degree as the average effect, the accumulated power of the lens, on the supposition of an equal effect over the whole surface of the focus, will be equal to 73938°. BURNING-GLASS.

It must be recollected by those who have had an opportunity of examining the effects of this lens, that the external part of the focal light was less intense than that part which was near the centre of it; or, rather, that the effect was very much accumulated in the centre: but as it is possible that the refraction of the light and of the caloric fluid may not take place in the same angles, we think it safe to consider it as of an uniform effect, and after deducting one-fourth part thereof as a compensation, there remains 55454°, as the expression of its power.

As the application of the second lens reduced the diameter of the focus to half an inch, the effect, without allowing for the reduction of its power, would be equal to 221816°, but deducting one-fourth for the second transcription, there remains 166352° as the expression of its power.

Supposing that the rays of the sun emanated from a point, the focus of the lens would also be a point; for the rays transmitted through one edge of the lens would meet those transmitted through the other edge, so that the focus would be without parts, or a mathematical point; but as the sun is known to move at 31° 32" during the apogee, and 32° 38" during the perigee, the focus must necessarily be 0.7105 parts of an inch diameter at Midsummer, and 0.7594 at Christmas. The length of the luminous axis at Midsummer must, from the same cause, be 3.428 inches, and, at the opposite period, 3.557; because the dimension of the focus is actually dependent on the apparent diameter of the sun, the semi-diameter being to be added to increase the measure of the converging rays on each of the opposite sides, the tangent of which is the semi-diameter of the focus; and by the same means the length of the axis is discovered, adding to and subtracting from the converging angle, by which means the points at which they meet on the axis are discovered. These two points disclose the commencement of the luminous appearance thereon.

The variation between the above calculated diameter of the focus and what it really was, points out the errors in the instrument, which must arise from one of two causes, or from both, viz. that the axis of the two fids are not coincident, or that they are not opposite to each other; should the difference have been occasioned by either, the focus would have been elliptical; but as this was not ascertained, it can only be said that a very small deviation in each would have occasioned this enlargement of the focus; and possibly they might have acted in contrary ways, which would have made it nearly circular.

But as this lens was exported many years ago, we are not able to determine whether the focus stated to have been one inch diameter was ascertained by its burning effect, or by the diameter of the focal rays: if by the diameter of the rays, the enlargement thereof must have resulted from the above causes; but if from its burning power, it tends rather to establish the theory of Dr. Herschell, that the rays of caloric are less refrangible than those of light, and that the true burning focus lies rather beyond the apparent focus.

We are far from thinking the above statement an extravagant supposition, when it is recollected, that all the experiments on which we ground our opinion were made with a total exposure of the substances to the action of the circumambient air; and had the property of this fluid, as to its conducting power of heat, been then well understood, so as to have prevented the diminution of the effect, we are well satisfied the result would have justified our conclusion.

The ingenious experiments of Mr. Wedgwood, and the extensive use of his pyrometer, for the admeasurement of heat required to melt metals, are now too well understood to require any eulogium in this place; it is sufficient to state that he estimates the heat required to melt the following substances to be as follows:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Fahrenheit or by Wedg.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red heat visible in day light</td>
<td>1070°</td>
</tr>
<tr>
<td>Fine gold</td>
<td>5837</td>
</tr>
<tr>
<td>Welding heat of iron greatest</td>
<td>13427</td>
</tr>
<tr>
<td>Cold iron melts</td>
<td>17077</td>
</tr>
<tr>
<td>Greatest heat of his furnace</td>
<td>21877</td>
</tr>
<tr>
<td>Extremity of the scale of his pyrometer</td>
<td>32277</td>
</tr>
</tbody>
</table>

The power of the lens estimated by this pyrometer will be found to be 1956°, and supposing the hottest furnace to be 240°, the focal heat thereof is 5.2975 times greater.
In justification of the opinion we have given, we now proceed to furnish a selected enumeration of the experiments which were made with this justly celebrated instrument, under the inspection of Major Gardner, brother to the admiral Lord Gardner, together with some gentlemen of the Royal Society.

Iron scoria, and the turnings of iron. The scoria appears to have been melted in much less time than the turnings, a result that might have been expected to have been directly the reverse; but some allowance must be made for the probable difference in the effects or intensities of the solar rays at the periods at which the experiments were made.

Calk of iron from vitriolic acid, precipitated by mild fixed alkali, weighing 5 grains before exposure, weighed afterwards 51 grains; which indicates an increase of weight by an absorption of phlogiston.

Regulus of zinc began almost instantly to flow, and was nearly evaporated; the remains were magnetic.

Regulus of cobalt was completely evaporated in 57°.

Regulus of bitumen was nearly evaporated when exposed on a charcoal reit; but on black lead it began to fuse in 2°, and very soon after passed into a state of complete fusion; it lost only half a grain in weight from an exposure of 180°; on a bone-ash reit it fused in 3°, and in 150° it was reduced to 7/16 grains.

Regulus of antimony: 33 grains were fused in 5° on charcoal, and after 195° there remained only 11 grains; but when exposed on a charcoal reit for the same time, there remained afterwards 28 grains, which showed a magnetic affection.

Fine kearths from the cannon foundery evaporated very fast during 120°, and in 30° more the remainder began to flow into globules, which, on being cold, were attracted by the magnet. This experiment of itself supports the claim of this instrument to a vast superiority over the heat of any furnace hitherto known.

Crystal pebble of North America: 5 grains exposed contracted in 15°, perfectly glazed in 135°, chafed in 150°, and when taken out appeared semi-diaphanous, of a white colour.

Several of the semi-crystalline substances, exposed to the focal heat, exhibited symptoms of fusion: such as the agate, oriental flint, cornelian, and jasper; but as the probability is that these substances were not capable of complete vitrification, it is enough that they were rendered externally of a glassy form.

Garnet completely fused on black lead in 135°, lost 4 of a grain, became darker in colour, and was attracted by the magnet.

Ten cut garnets taken from a bracelet, began to run the one into the other, in a few seconds, and at last formed into one globular garnet.

The clay used by Mr. Wedgwood to make his pyrometric test, run in a few seconds into a stone enamal. Seven other kinds of clay, sent by Mr. Wedgwood were all vitrified.

Several experiments were made on limetone, some of which were vitrified, but all of which were agglutinated; it is, however, suspected that some extraneous substance must have been intermixed. A globule produced from one of the specimens, on being put into the mouth, flew into a thousand pieces, and flew away in the best of glass. On being cut by a lapidary, it was found to be so hard as to serve as a diamond to write on glass.

Several specimens of lavas, and other volcanic productions, were exposed to the focus of the lens, all of which yielded to its power. This furnace of nature, the volcano, is supposed to be hotter than any furnace constructed by the
art of man, and as none of these sublunacies have been found perfectly vitrified, the conclusion is, that the volcano must exceed them in its power.

The following observation made by Major Gardner, he applies to all the experiments made by him during a period of many months: we will use his own words:

"That no sublunacy can remain any length of time in its state unfused or vitrified, unless it be externally white or diaphanous; but in a number of instances even these properties do not prevent their being fused or vitrified: when they do, it appears, in the first case, that the rays were in part reflected (perhaps before they came in contact with the intensely white sublunacy); and from this circumstance the sun's rays are prevented from exciting their full power upon them."

Some experiments were made in the year 1802, with Mr. Parker's lens, with the view of ascertaining whether the moon communicated any heat to the earth, in common with the reflected light from which we derive so much advantage.

This experiment was attended by Dr. Joseph Banks, with several members of the Royal Society, together with Dr. Crawford, who provided the most sensible thermometers; but after applying them to the luminous focus, so far from a perceptible increase of heat, it was thought there was perceived rather a diminution thereof; but this supposition did not lead them to a fair investigation of the fact.

Since this period some experiments have been made that enshrine the power of communicating cold by reflection; but as this fact has not yet been explained sufficiently with the present received theory, we shall contain ourselves with taking notice of the experiment made by M. Pitot. Two concave mirrors being placed at the distance of 103 feet from each other, a very delicate air thermometer was put into one of the foci, and a glass matrix full of snow in the other. The thermometer sunk several degrees, and rose again when the matrix was removed. When nitric acid was poured upon the snow (which increased the cold) the thermometer sunk 5° or 6° lower. Here cold seems to have been emitted by the snow, and reflected by the mirrors to the thermometer, which it thought could not happen unless cold were a sublunacy.

It has been found that upon an admixture of equal quantities of snow, which is always at 32°, and of water heated to 172°, the result is that the compound only retains the lowest heat of 32°, so that 140° of heat or caloric disappears.

Much has been said respecting the point or degree at which the thermometer should indicate the presence of heat. The experiments of Dr. Crawford seem to place it at 126° below the present 0. Mr. Kirwan places it at 104°. Mefers. Lavoisier and La Place at 273°; and by a mixture of four parts of sulphuric acid with three parts of water, it seems that it should be placed at 580° below 0.

Experiments of this kind may be made ad infinitum, and in time it may possibly be ascertained that cold is a real sublunacy; but for the purpose of getting an answer to the present question, we will accommodate the scale of Fahrenheit, by adding 15° thereto so as to make the 0 correspond with the caloric imbibed by snow or ice before it can melt. The average temperature of the air, mentioned under the article Burning Glasses, of 70° will be now considered as 78 of the new scale.

The superlatives of spherical bodies are to each other as the squares of their respective diameters. The diameter of the moon is considered to be 2180 miles, and its mean distance from the earth 240,000, from which it follows, on the supposition that all the solar rays received by the moon were reflected back, and that the earth was absolutely without heat, that the effect of this reflection would be found to be 0.0257 of a degree (for 140.600 x 2°: 178°: \[2180°: 0.0257\]), which multiplied into 105 degrees, and this sum increased four times for the increased power of the second lens, would give 4.5124° as the heat of the focus; 92.257° below the present 0, or 124.287° below the freezing point.

This diffusion is interesting in another point of view, for this calculation ascertains that the light afforded by the moon, when compared with that by the sun, abstracting all impediments in both cases, is only as 1 to 48.85.

A subscription was proposed for raising the sum of 700 guineas, towards indemnifying the charges of the inventor, and retaining the very curious and useful machine above described in our own country; but from the failure of the subscription, and some other concurring circumstances, Mr. Parker was induced to dispose of it to Captain Mackintosh, who accompanied lord Macartney in the embassy to that country; and it was left, much to the regret of philosophers in Europe, at Pekin; where it remains in the hands of persons, who most probably know neither its value nor use.

BURNING OF HEATH, in Agriculture, a practice employed in some districts for clearing ground covered with this sublunacy, in order to procure grags and herbage for cattle. The most proper time for this business is towards the latter end of the summer, when the plants are withered: care should be taken that the fire extends no farther than is intended, by clearing away the grass, and other dry vegetable matters, on the side which is to be preferred from the flames, to a distance sufficient to prevent all communication. The grass and other sublunacies which are cut down, being spread upon the part intended to be burnt, may serve for kindling the fire after they are become dry, and in a late fit for combustion.

For this operation a fair calm day should likewise be chosen; when, by kindling the fire on the side the wind blows from, the danger of its spreading too extensively is more fully guarded against. If, however, notwithstanding these precautions it should spread to places intended to be preferred, and where there is no water, the most effectual way of stopping the progress of it is to dig a trench; as, by throwing up the earth on the side where the fire is, the grass is covered and the flames thereby hindered from extending farther.

BURNING OF LIME, the process of converting hard or strong calcarous sublunacies into lime by means of fire. See Lime-burning.

BURNING OF STRAW, a wasteful dissipating practice employed in some districts for the purpose of converting it into ashes for manuring land. It is observed by Mr. Young, in the Report of Lincolnshire, that "the most singular practice he ever met with in manuring sublunacies is that of spreading dry straw on the land and burning it. At lord Yarborough's, he says, he first heard of this custom. His lordship's tenant, Mr. Richardson, a very good and intelligent farmer, gave him the account, having long practised it with success. The quantity is about five tons an acre. At Great Lamar he straw-burnt a piece in the middle of a field preparing for turnips, and on each side of it manured with ten loads an acre of yard-dung, and the burnt part was visibly superior in the crop. In another piece the same comparative trial was made, in 1765, for turnips; and now, in 1797, the barley is equally superior. On another farm he had at Wold-Newton he did it for turnips, then barley, and
and the burnish was better in all these crops than yard-dung. Burning goose in this manner results in great crops, but the expense is too high. He is clearly of opinion, that it is the warmth from the fire that has the effect, and not the ashes; for the quantity is nothing, and would blow away at one blast. It is proper to obviate, say he, that they do not use straw used in feeding cattle at more than 48, or 50, a ton. Mr. Mulhis of Lumber is of the same opinion, and thinks four tons are enough; and never that it will fail for turnips. For straw burning husbandry the reporter found again at Belfely. Mr. Lloyd, who, he should observe, is an excellent farmer, thinks that it takes for two acres, which will last longer in its effect, and burn the dung which the straw would make, and in general last longer than common dunging. Keeping much cattle, he cannot practise it, but highly approves it. In discourse at Harecastle ordinary on burning straw, the practice, he says, was much reprobated; yet an instance was produced that seemed to make it in favour of it. Mr. Elmirall, of Hazeldrop, burnt twelve acres of coke-feed straw on eight acres of the twelve, and the effect was very great, and seen even for twenty years. He sowed wheat on it, four bushels an acre, and had five quarters: the same upon which nothing was burnt, much the better land, yet the crops on the burnt part were by that mode equal to the rest. But in another similar experiment for turnips, Mr. Rancliff observed, the result and the effect lasted only for one crop. Mr. Kirkham, who was in company, gave it as his opinion, that, as cattle would not eat it, but, it might be beneficial to collect and flake that, and, before turnip sowing, burn it. The reverend Mr. Allington of Swainop has burnt on the land for turnips, the long-straw dung from the surface of the farm yard, and has had better turnips there than where the dung was laid. This has been the cafe in two experiments he has made." On flint adhesive foil it is probable some advantage may be produced by the action of the fire in this mode, but in other cafes it must be a waitful practice. The nature of the land on which these trials were made is not, however, mentioned.

"About Tashwell," the reporter adds, "there is no burning straw upon land; Mr. Clough, Mr. Hyde, and Mr. Pearson, fecured the idea of such a thing being common. It has, however, been tried there, for Mr. Oldham of Elkingdon did it, after ploughing for turnips, with long straw from the yard, and he succeeded well for the most part." BURNING of Land. See PAVING and BURNING.

BURNING of Metals. This metal, with metal, is either performed by fire, or by corrosive falls; which latter is also denominated CEMENTATION.

The first preparation of metal ores is by fusion, or burning, whereby to dispose them for fussion. This is usually performed by exposing them, without addition, to a naked fire; sometimes fixed alkalis and absorbents are added, to hinder the evolution of the metallic particks. Some hold burning in the flute or glebe most advantageous; others burning in the meal. Phil. Trans. No. 169. The baker metals, tin and lead, may be burnt like plants to ashes. For gold and silver, the cafe is otherwise.

BURNING MOUNTAIN. See VOLCANO, EARTHQUAKE, MOUNTAIN, &c. See also Etna, Hecla, Vesuvius, &c.

Travellers into Italy describe a burning spot of ground at Firenzula, in the Apennines, out of which a cracking flame continually arises, yet without any clief for it to issue out at. Maffi supposes the flames which the place yields, to be a kind of native "phosphorus ardens," which take fire on their coming in contact with the air.

BURNING, among Painters. Several of the painters' colours require burning, to fix them for use, as lamp-black, um- ber, ivory, &c.

The burning, or rather drying, of lamp-black, is per- formed by letting it over the fire in an iron ladle, or crucible, till no smoke arises from it. To burnumber, they put it in large lamps into a naked fire, where it is left till thoroughly red-hot. Ivory must be burnt, to make a black, in two crucibles, heated, covered with coals.

BURNING, in Enamel Painting. See ENAMELLING.

Burning is also an operation in Pharmacy. Simples are frequently burnt in earthen-vehils, either to reduce them to ashes, as in the preparation of vegetable salts, or, in order to dry them, that they may be more commodiously pulverized, as is practiced in regard of hartthorn, &c.

BURNING Phosphorus. See PHOSPHORUS.

Burning plant. See EUPHORIA.

Burning spring, in Natural History. See SPRING.

Burning Zone, in Geography. See TORRID Zone.

BURNISHED gold or silver, denotes those metals laid on any work or leaves, and afterwards passed over with a burnisher to heighten their lustré.

BURNISHER. See BURNISHING.

BURNISHING, the operation of giving an uniform and brilliant surface to a variety of substances by friction, with a polished hard instrument usually called a burnisher.

The modes of pollute in use amongst artificians may, perhaps, be all reduced to four;—the apertures of a rough surface may be removed by cutting off the protuberances, as in planing; by abrading them, as in filing and polishing; by obtunding them with the hammer, as in planing; and by accomplishing the same purpose in the manner now under our consideration.

It will be readily perceived, that the two latter operations can only be performed on such substances as possess a certain degree of malleability or ductility; those which are brittle, as gilts or hardened steel, will necessarily be incapable of being burnished.

To speak of all the descriptions of artificains who use this procés would be to enumerate almost the whole of those who work on metals. The instruments with which it is performed are also as various as the surfaces to be subjected to their action; we shall therefore only speak of such as are used for plane surfaces. The burnisher is a rod generally a piece of very hard steel from or four inches long, and about one eighth of an inch thick, with a somewhat convex edge, not much unlike that of the steel which is commonly used for striking fire, all the angles of it being smoothly rounded off, so that the longitudinal section of the part to be applied to the subiect is a semi-ellipse of great eccentricity, the edge of which is nearly semi-cylindrical. It is applied in different ways according to the nature and extent of its use in the workshop. The manufacturers of ornaments for flowers, who use a great number of burnished plates of soft steel, frequently insert it into the lower extremity of a wooden pole, which is suspended over the work-bench, from one end of a strong wooden spring fixed horizontally in a frame attached to the ceiling, and prelving downwards, so that the workman has only to pull it backwards and forwards horizontally at right angles to its own plane, over the surface of the plate, its pressure being produced, or, at least, assisted by the action of the spring. Some workers in metal apply the burnisher by attaching it to the under side of a lever, which has a handle at one end, and is hooked at the other
other into a fixed flap; others fix it obliquely into one end of a staff, the other end of which is curved like a faythe, and paffes over the right shoulder of the workman, who is by this means enabled to exert a confiderable degree of prejudice; and others again merely infet it into a handle, or a short bar with a handle at each end, and apply it in the fame manner as a common rapf or file, or in fome inltances as if fliding with a black lead-pencil. In whichever of these modes the burnisher is applied, the direction of its motion fhould be always rectilinear, parallel to itself, and at right angies with the edge of the instrument.

There is also another method of applying the burnisher, which is by keeping the instrument itself at ref, without the surface, subjected to its action, is turned in a lathe. The process is thus conducted by the branchier, ironmonger's founder, pewterer, and indeed all the artificers who employ that engine.

There are two precautions necessary to be observed in this operation: the one is to keep the semi-cylindrical edge of the instrument as highly polished as possible by frequently touching it on a piece of buff leather, rubbed with finely prepared crocus martis, and the other to keep the surface to be burnished constantly lubricated during the friction, with some liquid of a smooth confiftence, fuch as milk, oil, or a solution of soap, the latter of which seems to be the fittest, and molten generally approved of for this purpose. If this be neglected the surface is apt to ripple up before the instrument, and the ridges thus produced being laminated, by the continued friction, into very thin flakes or flakes, the work becomes defaced by dark coloured spots and flecks, which are frequently iridifcent like those on the wings of a butterfly, and the procfs confequently fails.

Bookbinders burnifh the edges of their books by rubbing them with a dog's tooth. Gold and silver are burnifhed with a wolf's tooth, a dog's tooth, or the blood flone, or by tripol, a piece of white wood, emery, and the like.

Deer are said to burnifh their heads, when rubbing off a white downy skin from their horns against a tree, they thrust them, as is faid, into a reddifh earth, to give them a new colour and lustre.

BURNLEY, in Geography, a market town of Lancashire, in England, is feated on a peninsula of land between the rivers Calder and Brown, which unite their streams a little north of the town. Its advantageous situation on these streams has occasioned several manufactories to be established here. Amongst these are fome cotton machines, fulling mills, corn mills, and a mill for grinding dyers' wood. The church of this place, a large handsome structure, is under Whalley, and though only a curacy is confidered a very valuable living. Some lead mines have been disco vered in the vicinify of the town, and various Roman coins have been found. Burnley is a great thoroughfare. The country around it abounds with pit-coal, and qvatitles of free-flone, flag-flone and flate, are obtained from quarries in this neighbourhood. Here are a grammar school, and two dissenting meeting-houses; a market on Mondays, and five annual fairs. In the vicinify of the town is a very fine seat, lately belonging to Charles Townley, efq., who had amafed the fmcft and moft valuable collection of ancient sculpture in this country. Burnley is 211 miles N. of London; and it contains 687 houses, and 3395 inhabitants. Whitaker's History of Whalley, &c. 4to.

BURNNOSE, an article of drift among the Arab Bedouens and Kebyle, in Barbary; cor respond ing to our cloak, and worn by them over their lykes. This forms a confiderable branch of their woolen manufactory. It is woven in one piece, and rehumbles in its shape the garment of the little god Telephorus, being framed about the neck, with a cape, or Hippocrates' sleeve (for a cover to the head), and wide below like a cloak. Some of them are likewise fringed round the bottom, like Parthenop's and Trajan's garment upon the lofty reliefs of Constantine's arch. The burnmoe, without the cape, seems to refer to the Roman pallium; and with it to the borduncula, referred to by Martial, l. xiv. 17.

"Gallicia Santonicio velit in bordunculae." BURNS, Robert, in History, was the son of a farmer near the town of Ayr, the capital of Ayrshire, in Scotland, where he was born on the 29th of January, 1759. The family had all of them been farmers in the north of Scotland, but the misfortunes of the poet's father had occasioned him to accept the situation of gardener to a gentleman of small fortune in the neighbourhood of Ayr, in which employment he continued for the first fix or seven years of the poet's life. The father was a man of observation and experience, as well as of strict integrity, and wished to keep his children more under his own eye, than was convenient with the service in which he was engaged. For this purpose, he ventured on a small farm on his master's estate, and joined with some others of his neighbours to provide a schoolmaster for their children. Robert Burns was principally distinguished at these early years, by a retentive memory, a flubbornness of disposition, frequently attendant on genius, and an enthusiastic piety. At the age of ten or eleven, he was not only well grounded in English grammar, but somewhat more than usual of a critical scholar. He was principally indebted to a credulous and ignorant old woman in the family, for furnishing him with those legendary and supernatural tales, which fed a poetical imagination with its richest repast. The first regular compositions in which he took pleasure were, The Vision of Mirza, and a hymn of Addilion, which came within the compass of his school studies. The Life of Hannibal, and the History of Sir William Wallace were the first books he read as a volunteer, and they gave him more pleasure than any he read afterwards. Nor was polemical divinity without its attractions, but he soon raised the cry of heresy against himself, and it pursu'd him through life. He gained at this time a flight knowledge of French, and received afterwards some leflons in practical mathematics; but his studies were rendered irregular by the necessity of hard labour, owing to the advanced age of his father, and the ill success of his farm. Robert was the eldest of seven children, and a very dexterous ploughman. But his father's matter died, and they fall into the hands of a factor, against whose influence and capacity they had to contend, till the sixteenth year of the poet, who now began first to exercise his functions as such, in consequence of his first amorous attachment to his borduncula partner of fourteen. Soon afterwards his father removed to a larger farm, on which the family subsisted comfortably for four years; when they became embarrassed by litigation with their landlord, and William Burns was only saved from a prison by the intervention of a mortal disease. During these four years, his reading was confined to Salmon's and Guthrie's Geographical Grammars, the Spectator, Pope's Works, some of Shakespeare's Plays, Tull and Dickson on Agriculture, the Pantheon, Locke's Essay on the Human Understanding, Stack-hou's History of the Bible, Justice's British Gardener's Directory, Boyle's Lectures, Allan Ramsay's Works, Taylor's Scripture Doctrine of Original Sin, A Select Collection of English Songs, which he carried with him when he drove his cart, and Hervey's Meditations. He was very awkward in his person and manner, a disadvantage which
he fought to remedy by attending a country dancing-master, in opposition to his father's direct negative. This produced an unfortunate disagreement between them, to which he contributed in a great measure the subsequent diffipation of his habits.

Thus did his life pass till his twenty-third year; bodily labour was his employment, and a succession of love adventures his amusement. The bias of his mind was strengthened by the addition of Trittram Shandy and The Man of Feeling to his library. He now engaged with a flax-drawer in a neighbouring town; but the shop took fire, while the partners were carousing, and the poet was left without a fixence. After his father's death, he joined his second brother in a farm, but without success. During this period, he formed a connection with a young woman, the consequences of which induced him to give her an acknowledgment of private marriage. Her parents, however, finding his situation so desperate, prevailed with her to relinquish it. He was driven to the verge of ruin, and threatened with a goal, when he engaged to go to Jamaica. But as his compositions had become popular in the neighbourhood, he resolved to publish his poems before he quitted his native country. The first edition, in 1756, produced him nearly twenty pounds for the expenses of his voyage; he had taken the first farewell of his friends, when a letter from Dr. Blacklock, advising a second edition, carried him to Edinburgh, and opened at once new prospects to his poetical ambition and new temptations to those venal propensities, which deprived his genius, and fixed a pernicious influence over his future life.

His genius and talents introduced him into the circles both of rank and literature; and his powers of conversation are said to have increased the applause bestowed on his writings. Professor Dugald Stewart observes, in a letter to Dr. Currie, "that all the faculties of his mind were equally vigorous; and his predilection for poetry was rather the result of his own enthusiastic and impassioned temper, than of a genius exclusively adapted to that species of composition. From his conversation I should have pronounced him fitted to excel in whatever walk of ambition he had chosen."

He had gained five hundred pounds by the sale of his poems, with part of which he entered on the farm of Ellifland, on the banks of the river Nith, six miles above Dumfries, in the year 1785. He had previously been placed on the list of candidates for the office of exciseman; and unfortunately for his health and his morals, he afterwards obtained the appointment. Before he hired the farm, he had become the husband of the young woman mentioned above, who had been turned out of doors by her father. He was now become a parent in his turn; in the cares of his undertaking the happiness of his family was involved, and he determined, after pondering seriously on the part to abandon the society and dissipation of which he had been enamoured. It is greatly to be regretted that he found it so much easier to form than to execute his project of reformation. At the end of the year 1791, he found it necessary to resign his farm into his landlord's hands, and remove to a small house at Dumfries. Here he was betrayed into an approbation of the French revolution, more ardent than was consistent with the opinions of his superiors. He was therefore subjected to the animadversion of the board, but retained his situation by promising more guarded behaviour, on the intervention of a friend. "Among the inhabitants of Dumfries," says Dr. Currie, "there were never wanting persons to share his social pleasures; to lead or accompany him to the tavern; to partake in the wildest follies of his wit, to witnæfs the strength and degradation of his genius." Thus beset where he was most vulnerable, it is a subject of greater sorrow than surprize, that he should have fallen into those irregularities, which terminated his short career in July 1796, in the thirty-eighth year of his age. Yet, lowered as was his character, and pernicious as were his habits to his corporeal frame, he retained his vigour of mind and imagination to the last, and never, in his greatest distresses, lost sight of honour in his pecuniary transfections, or bartered his independence to supply his necessities.

With respect to his social character, it is exactly fixed by the lively remark of a Scotch lady, that no man's conversation ever carried her so completely off her feet as that of Burns.

The character of his poetical compositions is strongly marked with the impression of his birth and station. He took no pains either to elevate his imagery, or polish his dialect. He adopted the simplicity of nature for his guide, and subjected himself to the dream of native sensibility, in his weary pilgrimage through an obscure and unhappy life. He is always interesting; but never splendid. His fancy is drawn on the spot, and his characters and incidents bear the stamp of biographical and historical truth, rather than of poetical fiction. His humour is rich, his pathos is natural, and he sometimes refers to the sublime; but his superiority is most decisively established in the descriptive. His poetical character cannot be better concluded than in the words of Dr. Currie. "To describe the comparative merit of Burns would be no easy task. Many persons, afterwards distinguished in literature, have been born in as humble a situation of life; but it would be difficult to find any other who, while earning his subsistence by daily labour, has written verses which have attracted and retained universal attention, and which are likely to give the author a permanent and distinguished place among the followers of the muse. If he is deficient in grace, he is distinguished for ease, as well as energy; and these are indications of the higher order of genius. The father of epic poetry exhibits one of his heroes as excelling in strength, another in swiftness; to form his perfect warrior, these attributes are combined. Every species of intellectual superiority admits perhaps of a similar arrangement. One writer excels in force, another in ease; he is superior to both, in whom both these qualities are united. The force of Burns lies in the powers of his understanding, and in the sensibility of his heart; and these will be found to infuse the living principle into all the works of genius which seem defined to immortality. His sensibility had an uncommon range. He was alive to every spæcies of emotion. He is one of the few poets that can be mentioned, who have at once excelled in humour, in tenderness, and in sublimity; a praise unknown to the ancients, and which in modern times is only due to Ariosto, to Shakspeare, and perhaps to Voltaire. To compare the writings of the Scotch poet with the works of these giants in literature, might appear preposterous; yet it may be asserted, that he has disfigured the foot of Hercules. Now near he might have approached them by proper culture, with lengthened years, and under happier auspices, it is not for us to calculate. But while we run over the melancholy story of his life, it is impossible not to heave a sigh at the Reality of his fortune; and as we survey the records of his mind, it is easy to see, that out of such materials have been reared the fairest and most honourable monuments of genius."

In his correspondance there are much good sense, and an admirable turn of expression. The late Dr. Robertson thought Burns's prose equal to his poetical compositions; and the public in general are nearly of the same opinion. His critical powers were more matured, and his taste more correct.
correct than can at all be accounted for by his opportunities; and the circumstance must be ascribed to the happy temperament of a mind, which could by sympathy assimilate itself to that state of refinement and cultivation, usually the result of scholastic instruction, or the elegant pursuits of polite life. On the whole, the character of Burns is equally interesting, as a noble specimen of untutored nature, forcing itself to a level with the higher and more favoured clatres of its species; and instructive as a warning, that the advantages of the conflict, however successful, are irretrievably lost, unless discretion is called in to secure and perpetuate the trophies won by genius. Persons of keen sensibility are exposed to peculiar dangers; and poets are perhaps of all others the description of men, who contribute most to the refined pleasures of society, and are least successful in appropriating to themselves their own individual share of personal happiness or public esteem. Their occupations are calculated to increase the peculiarities, rather than to strengthen the governing powers of their minds; their sensibility is indulged at the expense of their peace, and the pride of genius is footed by a contempt of the ordinary rules, which restrain the passions of common men. To caue these faults we attribute, and on such grounds of palliation must we excuse, the morbid melancholy, the facetious propensities, and the intemperate habits of Burns. When these are forgotten, or only remembered through the favourable medium of candid biography, his poems, with all the disadvantages of an obscure dialect, will be recited by his rustic countrymen, as long as the simplicity of their feelings remains unsoftened, and read with admiration by the critic, as long as the laws of poetry and criticism are suffered to accord with the dictates of nature.

BURNT, in speaking of medicines, imports as much as imperfectly calcined. See Calcination.

Burnt bodies are generally dry and astringent. The other medicinal qualities belonging to bodies are frequently destroyed, at least impaired, by the burning.

BURNT-Clay, in Agriculture, such clay as has undergone a process of calcination by means of fire. In this process, it is supposed by Dr. Darwin that oxygen is combined in large proportions either with the clay itself or the metallic particles which it may contain, and on this account probably becomes useful as a manure. This benefit may be accomplished by means of clamps or kilns, or simply by piling up heaps of clay loosely together, with a little dry brushwood, or other similar combustible materials in the middle of which the fire may be applied. In this way much manure may be easily procured, where the materials abound.

Calcined clay, as a manure, is probably most proper for clove compost soils, as it opens and renders them more porous, and thereby disposes such lands to part with their vegetable nourishment more readily.

It is also supposed, by the author we have just mentioned, that calcined clay, as it exils in soft bricks, has a power of decomposing marine salt, as he once observed in a cellar, where beef had been long salted on one side of a nine-inch wall, the wooden salting-tub for which was attached to it; a great efflorescence having appeared on the other side of the wall, which he believed to be soffile alkali, or natron. If this idea be just, says he, the soft bricks from old buildings, or clays so far purposely burnt, may in this manner be serviceable to vegetation, by separating the soffile alkali from the sea-salt, washed from decomposing animal and vegetable substancess, which, by converting carbon into an hepur carbonis, as lime is supposed to do, might render it soluble in water, and capable of being absorbed by the lymphatic vessels of the roots of plants. And, continues he, if clay, calcined to a certain degree, and thus united with oxygen, posessed the power of decomposing marine salt, there is reason to believe, when it is more slowly united with oxygen by its exposure to the atmosphere by the spade or plough, that it may possess the same property, and that this may have given rise to the very contradictory reports concerning the use of sea-salt in agriculture, as it may probably be of great advantage to clayey soils, but perhaps not so to other soils. See Clay.

BURNT-grain, a vegetable disease frequently met with in the ears of grain, but which is probably not yet well understood; the characteristic marks of which, according to some, are, that the plants which produce burnt ears are strong and vigorous; that the infected ears are not at first distinguishable from those that are healthy; but, when they are past their bloom, they appear of a deep green colour, approaching to blue; they afterwards become whitish, and are then easily known. "As this change of colour is effected by the sun, when a number of white ears have been suddenly perceived in looking over a wheat field, the sun's heat has been often thought to cause this distemper, or a fog preceding that heat. And though all the ears produced from one grain are commonly infected, yet found ears are met with on plants that have produced others which were infected. Some ears have even been observed, part of which only were vitiated; and, finally, some grains enclosing partly a white flour, the remainder black dust."

It has been farther remarked, that, in burnt ears, the chaff, or outward coat, is commonly found, with this single difference, that, when the ears are nearly ripe, it appears more withered and dry than in the healthy ears. The bulk which immediately enclosed the grain is not destroyed, but has confidence enough for the grain to preserve nearly its natural form, with a whitish look; and the burnt grains are shorter, rounder, and lighter, than such as are uninfeeted; they are sometimes larger and sometimes smaller. The furrow which runs the length of a grain of wheat is sometimes totally effaced, at others visible; the pits at the extremity of the grains are dried up, but the bud of a burnt grain is not visible. Till the blooming season, there is very little difference between the diseased grains and those which are healthy; they are only a little more swelled: but, in the blooming season, the inflected ears assume a bluish colour; the chaff is more or less speckled with small white spots; the grains are of a deeper green, and larger than in the natural state, and, as long as they preserve that colour, they adhere strongly to the chaff. The distemper, it is said, has often attacked very young ears, while yet enclosed in the sheath. The flaming on the sides of the grain are then dried up and sickly; the embryo in part takes the deep green colour above-mentioned; the infected ears have not the confidence of those that are healthy. In the same proportion as the distemper advances, the chaff becomes dry and whitish. The grains have some degree of firmness. On opening them, which may easily be done with the nail, there appears an anctious, dark-brown, blinding substance. The dust of burnt grain has also some cohesion or tenacity. By others it is, however, supposed to originate from insects; in which view we have the following remedies proposed on the authority of experiment in the seventh volume of the Bath papers. The trials were made in the middle of a twenty-acre close, the refuse of which was sown with the same kind of wheat, and treated in the same mode as Nos. I. and II. and was equally as clean, and the crops have been so ever since. The writer's mode of medicating his wheat was as in No. II.

"No. I. Sowed five drills with Mr. Cooke's machine,
with wheat treated agreeable to Mr. Middleton's re.

No. I. Sowed five drills with wheat wetted with old urine, three quarters to a bushel, and turned about with a throwel till all the urine was imbibed, then plenty of quick-

line was added on the third, and turned over and over with a throwel, and left it in a heap till the next morning.

No. II. Sowed five drills with wheat strewed two

hours in a strong lye, made of wood-ashes and lime, and laid on the barn floor to dry.

No. IV. Sowed with five drills of the same kind of

wheat.

The result was as follows:

Nos. I. and II. Scarcely a burnt car to be found in

them.

No. III. About a twentieth part burnt.

No. IV. Near a fourth burnt.

No. V. Picked ten good corns out of an ear, the re-

mainder were burnt; planted them in the garden; fixed them with a foot, which produced seventy-two ears, one root of which only was burnt; consequently the opinion that the good corns in a burnt car produce burns again is fallacious, oth-

erwise the whole must have been burnt.

The above experiments seem to prove, says the writer, that "wetting wheat with old urine, and drying it with

line, is a preventative," and he conceives that an infect

by depositing its egg, eggs, or seed, on the corn, when

growing, is the cause of burnt. Supposing this to be the

case, "the wetting the corn with brine, urine, or strong

lye, would of course destroy none of the eggs or seeds, or

even an animalule, and the lye, by its corrosive quality,

annihilate the remainder;" but "that any of the eggs, &c. remain on the corn animal, there may be here and

there a burn in the crop." But, "if on the other hand the

infest should deposit its egg, eggs, or seed, in the earth, it

is possible the brine, urine, and lime, wherewith the corn

is as it were coated when sowed, may be unpleasing to the
delicate taste of the little animal, and prevent its wound-

ing the tubes of the plant." Farther and more accurate ex-

periments are, however, still wanting to fully elucidate

and ascertain the nature and kind modes of preventing this vege-
table malady. See Smut.

Burnt island, in Geography, an island in Christmas Sound, at the southern extremity of South America.—Also, an island near the southern coast of Newfoundland; 15 miles E.S.E. from Cape Ray. N. lat. 47° 30'. W. long. 58° 50'.

Burnt islands, a cluster of islands in the Indian ocean, situate on the coast of Malabar, W.N.W. from Goa. N. lat. 15° 50'. E. long. 73° 30'.

Burnt planet. A planet is said to be burnt, combustus, when it is in conjunction, or nearly so, with the sun. Thus

Saturn is said to be burnt when not above five degrees distant from the sun; Jupiter when six, &c. Planets in this

situation are suppos'd by astrologers to be much weakened or enfeebled in their influences.

Burnt way, combula via, among Astrologers, that part of the zodiac from the beginning of Libra to the middle of

Scorpio; or, according to others, from the middle of Libra to the end of Scorpio, comprehending 45 degrees; a space

suppos'd very unfortunate, and in which the planets are much enfeebled in their virtues, especially the moon. Vital

Burnt, See Wine.

Burnt-coat island, in Geography. See Penobscot bay.

Burntisland, or Burnt-island, is a parish, and royal burgh, and sea-port town in Fifeshire, Scot-

land. Mr. Pennant describes it as "the best harbour on

the coast, formed by a rocky isle, close out with piers." This

harbour, though capacious, and of great depth, at high tides, is dry at low water. The town is situated on the banks of the Firth of Forth, upon a peninsula which is screened on

the north, by an amphithreatrical range of hills. It is nearly

opposite to Leith, from which it is distant six miles, and

about nine miles N.W. from Edinburgh. From the remains

of fortified walls, and entrenchments, it appears that this

place has been garrisoned, and was probably first fortified

by the French, when allied to the queen regent during the

troubles of 1660. Cromwell believed it during his usurpa-

tion, and forced the inhabitants to capitulate, though not

without certain conditions which ultimately proved

advantageous to the town; for, among other stipulations, he agreed to repair the streets and harbour, and build the quay. In

1715, the town was surprized and taken by the rebels, who

boldly opposed all resistance, and passed part of their troops

from this place over to the opposite shore. Before the

union, the trade of Burntisland was very considerable, and

confined principally in the exportation of corn and malt

to England, but this trade has declined for many years, and

it is not till very lately that the town has felt the benefit of

its revival. At present here are a sugar-house, a vitriol work,

and a distillery, besides ship building which is carried on to

some extent. The town is governed by 21 persons who are
denominated, and divided into 14 guild counsellors, 3 of

whom are bailiffs, and 7 trade counsellors.

The parish and environs of Burntisland are diversified with

mountain and plain. To the westward of the town the

shore is rocky, and on the east it is sandy. The rocks

constitute a good defence to the harbour, and at the same

time furnish sufficient sea-weed to make 12 or 15 tons of

kelp annually. Within these are some productive oyster-

beds, and other shell fish frequent the recesses. "The

hills in the neighbourhood of the town exhibit many

appearances of volcanic fire; one is extremely like an extinct

volcano, the crater being converted into a lake on the top

of the hill, similar to those observed by the abbe Spal-

zanoni." (See his Travels in the Two Sicilies). On the north

side of this hill are several basaltic columns, and near the

summit are the remains of an encampment, called Agricola's

Camp. The population of this parish in 1801 was 1530.

W. long. 5° 5'. N. lat. 55° 8'. Pennant's Tour in Scot-

land. Gazetteer of Scotland.

BURNWOOD. See BRAINTWOD.

Burntwood river, a river of North America, which

flows from Burntwood lake through Split lake into port

Nelson, and there discharges itself into Hudson bay.

The lake is in N. lat. 55° 3'. W. long. 98° 40'.

BURONZO, a town of Italy; in the country of Ver-

celli, 12 miles N.W. of Vercelli.

BUROW, a town of Germany, in the circle of Upper

Saxony, and principality of Anhalt-Zerbst; 2 miles W. of

Cobwick.

Burr, the round knob of a horn next the deer's

head. Burr denotes a hollow triangular chisel, used to clear the corners of mortises.

Burr, in Botany. See Bud.

Burr, in Geography, a small rocky island, with some

smaller rocks often covered by the water in its neighbour-

hood on the eastern coast of the country of Down, Ireland, a little to the north of which is tolerable anchorage. It is

nine Irish miles south of Donaghadee, and as many north of the entrance into Strangford lough. N. lat. 54° 28'. W.

long. 5° 19'.
BUR

BUR, in Heraldry, means a broad ring of iron behind the place made for the hand on the tilting spear, which burr is brought to the rest when the tilter charges his spear to secure it.

BURR-pump. See Bidge and Pump.
BURR-red, in Botany. See Sparganium.
BURR-flower. See Mill-flower.
BURRA, in Geography, a large and fertile mountain of Arabia, near Homran.

BURRA, one of the Shetland islands of Scotland, situated on the western coast of the main land. N. lat. 5° 28'. E. long. 1° 32'.

BURRAMPOOTER, or as it is called by the people of Aam, Burrampoot, a large river of Aam, and the noblest tributary stream of the Ganges, derives its name from a Sanscrit word, Brahma-poot, which signifies the "Son of Brahma," and became known to us, as a capital river, in consequence of the survey made of it by major Rennell, in 1763. He found it to be rather larger than the Ganges, and that its course previous to its entering Bengal was from the east, although all former accounts represented it as proceeding from the north. This noble river has its source on the opposite side of the same mountains that give rise to the Ganges, and still takes its course eastward, or directly opposite to that of the Ganges, through the country of Thibet, where it is named "Sapoo" or "Zanciu," which bears the same interpretation as the "Gongal" of Hindoostan, namely, "the river." After winding with a rapid current through Thibet, it washes the border of the territory of Laffa, and then deviating from an east to a south-east course, it approaches within 220 miles of Yunnan, the westermost province of China. Hence it turns suddenly to the west through Aam, where it probably changes its name, being there called Burrampoot, and enters Bengal on the north-east. After its entry into Bengal, it makes a circuit round the western point of the Garroo mountains, and then, altering its course to south, it meets the Ganges about 40 miles from the sea. After the river Megna has fallen into the Burrampoot, it communicates its name, though a much smaller river to the other, during the rest of its course. A singular circumstance, lately discovered, attends the courses of the Ganges and Burrampoot, with respect to each other. Iluding from opposite sides of the same ridges of mountains, they direct their respective courses towards opposite waters, till they are more than 1200 miles asunder; and afterwards meet in one point near the sea, after each has performed a winding course of more than 2000 miles. The Burrampoot, during a course of 400 miles through Bengal, bears so intimate a resemblance to the Ganges, except in one particular, that the same description may serve for both. The exception is, that during the last 65 miles, before its junction with the Ganges, it forms a stream which is regularly from 4 to 5 miles wide; and which, the freshness of its water excepted, might pass for an arm of the sea. In attempting to convey an adequate idea of the grandeur of this magnificent object, major Rennell adopts the poetical language of Thomsen, in his "Scacens:"

'"Scarce the muse
Dares stretch her wing o'er this enormous main
Of rushing water; to whose dread expanse,
Continuous depth, and wondrous length of course,
Our floods are rills.--"

The major, in accounting for the singular breadth of the Megna, is led to suppose, that the Ganges once joined where the Isamuntu now does near Fringy-bazar, and that their joint waters scooped out its present bed. The present junction of these two mighty rivers below Luckipour, produces a body of running fresh water, hardly to be equaled in the old hemisphere; and, perhaps, not exceeded in the new. It now forms a great interlaced with islands, some of which rival, in size and fertility, our life of Wight. The water at ordinary times is hardly brackish at the extremities of these islands; and, in the rainy season, the sea (or at least the surface of it) is perfectly fresh to the distance of many leagues from the shore. For an account of the bore in the Megna, see Bore. Rennell's Memoir.

BURRAS pipe, an instrument used by smiths, consisting of a copper box with a spout, having teeth like a saw; sometimes also used by fencers for the application of certain solid medicines by injection.

BURREL, see Entomology. See Wringle-tail.
BURREN, in Geography, a barony in the northern part of the county of Clare, Ireland. It is very mountainous, and Cromwell's forces which were sent to harass the inhabitants for refusing to pay contributions, complained that it had neither wood, water, nor earth, sufficient to hang, drown, or bury a man. Such, however, is the luxuriance of the pastures, intermingled among the rocks, that these seemingly barren hills supply a great number of cattle, and very large flocks of sheep.

BURRESAKANE, a port town of the county of Tipperary, Ireland, 79 Irish miles S.W. from Dublin.

BURRESHOOLE, a village and parish of the county of Mayo, Ireland, situated near the mouth of a small river of the same name, which falls into Newport of Clew bay, about two miles north of the town of Newport. It was once of sufficient importance to give name to the barony it is in; and even to the bay also. There still remains some part of a monastery founded here by one of the family of Bourke or Barsho of the branch called M. William Oughter. The barony is very mountainous, and entirely delitute of wood, but the soil in the valleys, which is mostly moory loam, is pretty good for tillage, in which it is almost exclusively employed. The barony includes the large island of Achill, and a great number of other islands.

BURROCK, a small wear or dam, where wheels are laid in a river for the taking of fish.

BUROS-IN-OSSE, a town of the Queen's county, Ireland, near the confines of Tipperary, 53 Irish miles S.W. of Dublin.

BUROSLEAGH, a port town of the county of Tipperary, Ireland, 77 Irish miles S.W. from Dublin.

BURROugh. See Borough.
BURROUGH, Edward, in Biography, one of the earliest preachers among the Quakers, was born of parents belonging to the established Church of England, at or near Kendal, in Westmorland, about the year 1634. In early life, he was distinguished by his piety and virtue, as well as by the manliness of his resolution, and the courteousness of his temper. Anxious for the purity of religious worship, he adopted, in his twelfth year, that of the Presbyterians, because he conceived it to be most conformable to the scriptures. At the age of 17, he attended the preaching of George Fox; and though at first he concluded in his own ability to refute the doctrines which were taught by that zealous propagator of the tenets and practices of the Quakers, he was proselyted by conferences with him, and became an ardent partisan of this sect. This second change of his religious opinions incensed his parents to such a degree, that they turned him out of doors; and to this hardship he submitted without repining. At the age of 20, he accompanied his intimate friend, Francis Howgill, to London, where he embraced every opportunity that offered itself, of addressing assemblies of people; and such were his natural eloquence and the fervour of his zeal, that he succeeded in gaining profelytes. His success, however, excited the interference of the magistrates,
Burroughs's Machine, in Mechanics, a machine for
grinding and polishing glass-plates, invented by Mr. Burroughs
of Southwark, for which the Society of Arts gave him a
premium of 70l.

This machine consists of a cog-wheel A, Pl. II. Optics, fig. 4,
12 feet in diameter, carrying 72 cogs; which turn a trundl-
head B, one foot and four inches in diameter, and furnished
with eight rounds; and also an horizontal spur-wheel C, of 12
cogs, and one foot eight inches in diameter. The trundl-
head B turns a spur-wheel D of ten cogs, and two feet eight
inches in diameter. This spur-wheel has two cranks, a, b,
in its shaft; one of which a gives motion to a wooden frame,
c, about 34 inches long and 19 broad. On the under side
of this frame are followed by screws twelve pieces of polished
metal, each five inches and a half long, and three broad,
covered with leather; and underneath these polishers, a glass
plate cemented in another frame is placed on the bench d,
and polished with triпул by the motion given to the upper
frame by the crank a. The nuts of the screws which fasten
the polishers to the upper frame are not screwed close to the
wood, in order to give the frame room to play; by which
contrivance the perpendicular rise of the crank is avoided,
and the motion of the polishers always parallel and equal.

The under frame may be moved by the hand in any direc-
tion without stopping the machine; by which means the
plate, when larger than the polishing frame can cover in its
motion, will be equally polished in every part.

The other crank, b, gives motion to two other polishers
marked a, c, which have an alternate motion by the bend-
ing of the crank; they move upon the frame plate, and
have an equal number of polishers as that already described.

The same crank also gives motion to a contrivance repre-
sented at e for polishing spectacle-glass. It consists of two
segments of the same sphere; one concave and the other con-
vex. On the latter the glass-plates are cemented; and polished
by the former, which is moved by the crank b. The con-
vex segment may be moved round by the hand without
stopping the machine, so that all the glass-plates on its super-
ciﬁcies will be equally polished.

But this contrivance, in which the merit of the machine
principally consists, will be much better conceived from a
small delineation of it by itself, fig. 5, where F is the crank
marked f in fig. 4 and turned by the spur-wheel C in the
same ﬁgure. G is the trigger, three feet two inches long.
I, a roller ﬁxed on the trigger for the rod to slide on. H, the
horizontal spur-wheel, eleven inches in diameter, ﬁxed on
the grinding plate; the teeth of which are touched by the
trigger; but with a very unequal force, as it will wholly de-
dpend upon the grinding-plate's being farther from, or nearer
to, the centre of motion of the trigger. By this simple
contrivance, the grinding-plate has a very compound
motion, never moving exactly in the same track, and therefore
must grind the plates equally in every part. Several at-
ttempts have been made by others for producing the fame
effect; but without success; the grinding-plate always fol-
lores the same track, and consequently the plates are ground
equally.

Burrough, of Barrow. See Barrow.

Burrow, Sir James, in Biography, master of the
Crown-Ofﬁce, was fellow both of the Royal and Antiquarian
Societies, and on the death of Mr. Welh in 1773, he occu-
pied the president of president of the Royal Society till the an-
iversary election, when he succeeded it to sir John
Barrow; and in 1773, on occasion of an address presented by
the Society to his majesty, he received the honour of
knighthood. He published two volumes of reports in 1766,
two others in 1771 and 1776, and a volume of decisions of
the
the court of king's bench, upon settlement cafes, from
1732 to 1773, to which was subjoined an "Essay of Punctua-
tion," in three parts 4to., 1768, 1772, 1776. This essay
was also printed separately in 4to., 1773. He also
published, without his name, a few anecdotes and observa-
ations relating to Oliver Cromwell and his family, serving to
rectify several errors concerning him; published by Nicol.
Comm. Papadopoli, in his "Hiliora Gymnasi Patavini,"
1703, 4to. He died Nov. 5, 1782.

BURREWS, holes in a warren, serving as a covert for
rabbits, &c.

A coney's coming out of her burrow is called bolting. To
catch coneyes, they sometimes lay burfe-nets over the bur-
rows, then put in a terrier clofe muzzled, which making the
creature bolt, she is caught in the net.

BURRUN-SUNDER, in History, the denomination of a
fifth or adventitious clafs of Hindoos, diftinft from, and
subordinate to the four regular clafs or claffes into which
they are distributed, and fuppoled to be the offspring of
an unlawful union between perfons of different clafs. These
are moftly dealers in petty articles of retail trade. This
adventitious call is not mentioned by European authors;
and they fome to be the members of this call as belonging to
the Soofer. Preface to the code of Gentoo laws, p. 46 and 99. See CAST.

BURS, in Navigation, are boats so called in Bengal,
which are used for inland navigation on the Ganges, and are
very lightly built of thin deals, without either keel or fide-
timbers. The edges of the planks are filled together with
staples, and the seams are bucked up with moss, and
payed with creafe. Their largest breadth is about one third
of their whole length from the keel, where they run up with
a bow: they are very sharp forwards, and are not very high
above the water. Although they are of different fizes, they
are all of the fame fhape and construction; and fome of
them can load fifty thousand pounds weight of merchandize,
and more. They are provided with a fingle mall, which
has a large square faul; and as they take in a great quantity
of water from the fides and bottoms, the crew are compelled
to employ fome perfon continually in baling. They are
ufed for the carriage of cotton, and other bulky materials,
the weight of which cannot bear any proportion to their fize.
In common with all the other boats of the country, their
bottoms are nearly flat; and indeed, it would be impracticable
on the Ganges to employ vehfels formed for drawing any
considerable quantity of water, as the navigation is rendered
extremely dangerous from the continual shifting of the
fands.

BURSA, Burfe, originally signifies a purse.

BURSA is more particularly used, in Middle Age Writers,
for a little college or hall in an university, for the residence
of students, called burfes, or burfari.

BURSA, Burfe, or Boufe, in the French universities, still
denotes a foundation for the maintenance of poor scholars in
their studies.

The nomination of burfes is in the hands of the patrons
and founders thereof. The burfes of colleges are not benefi-
cies, but mere places alligned to certain countries and per-
tons. A burfe becomes vacant by the burfer's being pro-
moted to a cure, as being incompatible.

BURSA, or PRUSA, in Geography, a beautiful town of
Asiatic Turkey, in the province of Natalia, fituate at the
northern foot of mount Olympus, and well watered by
springs. The Jews have four synagogues, the Greeks three
churches, and a metropolitan: the Armenians have likewise
a church, and an archbishop. The Berene is a spacious
didice, well built and filled with warehousses and shops, in
which are exposed to sale all kinds of merchandizes, brought
hither from the Levant, besides the beautiful carpets, silk
fluffs, velvet, &c. manufactured in the city itself. The Bi-
thanian filk, which is the finest in Turkey, is mostly manu-
factured here, besides considerable quantities brought from
Peria, which, though left fine, is wrought by the Prufian
workmen, who are allowed to be the best in Turkey for
weaving hangings, tapefry, carpets, and fuch articles,
which are in great request, and carried from hence into all
parts of Europe. The commerce of this place is much in-
creased by the carvans that pafs through it from Aleppo
and Smyrna to Constantinople, and also to Iffapan. This
city was built by Prufias, king of Bithynia, after whom it
was called Prufia or Prufia. In the year 947, it was taken
and difmantled by Seifeddulat, an Arabian prince of the
race of Hamadan; but fon after reconquered and founded by
the Greeks, who paffed it from that time till the year 1336,
when Orchan, the fon of Othman II., the emperor of the
Turks, reduced it and made it the feat of his empire. From
the conquest of Prufia, authors have dated the true era of
the Ottoman empire. About a league from the town is some
celebrated warm baths, on the road to which are seen the
tombs of ferveral fultans, and chapels of marble and jasper.
By Tournefort's computation of families, the number of
inhabitants has been estimated at 65,000. N. lat. 40° 3'.
E. long. 28° 15'.

BURSA, in Zoology, a species of Alcyonium, called in
common the fena-purfe. This is fomewhat globular, pulpsous,
and green. Gmel. Pallis decribès it as being subglobu-
lar, hollow, very green and soft, or pulpsous, and thickly
covered with transparent papille.

The alcyonium burfa inhabit the sea coasts of Europe;
it is coriaceous, and about the size of a middling apple.
The species is termed by Ray, &c. burfa marina. Aurantia
marina. C. Bauh. Aurantium marinum, Marf. hilf. mar. &c.

BURSA nucifla, in Anatomy, is an apparatus for facilitat-
ing the motion of muscles and tendons upon these parts on
which they are designed to glide backwards and forwards.
They are all found between other parts which have a fimi-
lar sliding motion on each other; as for instance, between
the joint of the shoulder and the aeronon.

The apparatus confifts of a bag, one surface of which is
closely connected to the muscle, and the other to the subja-
cent parts.

In structure it resembles the burfe or capsules of
joints, as in them there is secreted into its cavity a flippy
fluid like the synovia. When a muscle or tendon moves
freely and frequently upon a bone, the surface of the latter
is rendered more smooth by a thin crufit of cartilage being
formed upon it; and this circumstance further increases the
fimilitude of these contrivances to joints. An infence
of this may be obferved on the upper part of the os calcaris
upon which the tendo Achillis glides. These burfes will be
noticed in the description of the individual muscles to which
they belong. Dr. Monro has published a detailed account
of the burfe to which the reader is referred.

BURSALI, in Geography, a country of Africa, in Negroland, situated on the side of the river Gambie; about 12 leagues in length.
BURSALIS mycelius, in Anatomy, a name given by Cowper and others to a mucous of the thigh, called also marifapalis by the same authors. It is the obturator internus of Winlow and Albinus, and is described by Velsius under the name of clavus tertius movement, and by Spigelius under that of circumventris tertius, or obturator internus.
BURSAM. necocito per, in the Norman Laws, is a right belonging to the next akin, to redeem or purchase back, within a year after sale, a fee or tenement alienated by his kinman, on paying the price it had been fold at.
BURG. or BURSER, burfarius, is used in Middle Age Writers for a treasurer or cash-keeper.
In this sense we meet with burfars of colleges. Conven- tual burfars were officers in monasteries, were to deliver up their account yearly on the day after Michaelmas.
The word is formed from the Latin burf; whence also the English word purse; and hence the like officer, who in a college is called burlar, in a ship is called burser.
BURSARS or BURSER, in Universitas, also denote those who enjoy certain benefits left for defraying the expenses of the education of young men of promising parts, and small fortune. Actions brought for the effects of a college, are entered in the name of the principals and burfars. See Bursa.
BURSARIA, Burfary, in Middle Age Writers, denotes the place of receiving and paying money and rents by the burfars, or officers of account, in religious houses. See Burza and Bursar.
BURSARIA, in Entomology, a species of Apolis, found on the black poplar, in the hollow excreences which it forms in the leaves.
BURSARIA, in Zoology, a species of seetularia, described by Ellis, as an inhabitant of the British coasts. The denticles are opposite, compressed, falligiate, branched, and dichotomous; called the Shepherd’s Purse coraline in English.
BURSCHEIDT, in Geography, a town in Germany, in the bishopric of Cologny, near Aix-la-Chapelle, with a Cistercian abbey, the abbots of which has a seat in the diet.
BURSE, in Masters of Commerce, denotes a public edifice for the assembly and mercer of merchants and traders; and is used in the same sense with the modern appellation of Exchange. In the times of the Romans, there were public places for the meeting of merchants in most trading cities of the empire; that built at Rome in the 295th year after its foundation, under the consulate of Appius Claudius, and Publius Servilius, was denominated the "College of Merchants," of which some remains are still visible, and known by the modern Romans, under the name "Loogia." The Hans towns, after the example of the Romans, gave the name of Colleges to their burases.
The first place of this kind to which the name burse was given, Giuicardini affixes, was at Bruges; and it took its denomination from a hotel adjoining to it, built by a lord of the family de la Bourse, whose arms, which are three purses, are still found on the crownings over the portal of the house. Cato's account is somewhat different, viz. that the merchants of Bruges bought a house or apartment to meet in, at which was the sign of the purse. From this city the name was afterwards transferred to the like places in others, as in Antwerp, Amsterdam, Bergen in Norway, and London.
BURSE or BURSER, burfarius, is used in Middle Age Writers for a treasurer or cash-keeper.
In this sense we meet with burfars of colleges. Conven- tual burfars were officers in monasteries, were to deliver up their account yearly on the day after Michaelmas.
The word is formed from the Latin burf; whence also the English word purse; and hence the like officer, who in a college is called burlar, in a ship is called burser.
BURSARS or BURSER, in Universitas, also denote those who enjoy certain benefits left for defraying the expenses of the education of young men of promising parts, and small fortune. Actions brought for the effects of a college, are entered in the name of the principals and burfars. See Bursa.
BURSEAH, in Geography, a town of Hindoostan, in the Malwa country, 90 miles E. of Oogeen.
Gen. Ch. Cal. small, caducous, one-leaved, with three or five divisions. Cor. Petals three, or five, ovate or lanceolate, a little longer than the calyx, and alternating with its divisions. Stamens, five, or ten; sepals straight, shorter than the petals: anthers ovate or oblong. Pi. germ. superior, ovate, obtuse, or cornered: stigma short: stigma capitate, obtuse. Peric. capsule one-celled with three succulent valves. Linn. on the authority of Jaccou. Berry coriaceous, ovate, three-cornered: containing a fleshy pulp substance generally one, but sometimes two, or even five ovate, compressed nuts; convex and on one side, angular and uneven on the other, enclosing a kernel. The natural number is more than one, but the rind is generally abortive. La Marek.
Effen. Ch. Pericarp, a coriaceous drupaceous berry, containing from one to five nuts, angular on one side, and convex on the other. La Marek.
Obf. La Marek observes, that as the fruit contains a true stone with a kernel within it, and as, moreover, it is inclosed in a pulpy substance, and with a fleshy skin, it cannot be considered as a capsule: but in opposition to this opinion given in the Encyclopaedia, we may remark that, if his figure (fiiult.) be correct, it opens with three valves; a character not compatible with the definition either of a berry or a drupe. Authors differ much in their description of the fruitification. Schreber places it in the class Polygama, but doubts whether
BURSTADT, BURSLEM, VOL.

whether it does not properly belong to *diccia*, the anthus in the pinnate-leaved plants appearing to be fertile.

Sp. 1. B. gummifera, Linn. (Terebinthus, Comm. Brown. Sloani. Catechb. Palacia, Linn. Sp. Pl. Ed. 1.) La Marek Illilt. pl. 256. Jamaica birch tree. "Racemes axillary, flowers white." La Marek. A large and lofty tree. Trunk upright, smooth, round, covered with a smooth, thin, brown or greyish epidermis, peeling off in shreds like the European birch. Leaves, deciduous, alternate, unequally winged; leaflets three, five, seven, or sometimes nine, opposite, petiolate, ovate, acute, entire, smooth on both sides, a little shining beneath, about an inch and half or two inches broad, three inches long, a little heart-shaped at their base. Flowers, small, without smell, in compound axillary racemes, near the summit of the branches. Fruit, the size of a hazel nut, greenish, tinged with purple when ripe, rufous, odorous. La Marek. From the interior bark exudes a clear, glutinous balsamic juice, which flows like turpentine, and foons thickens in the air, into the form of a gum. The bark of the root is thought to be the Sima-roboth of the shops, which is an effectual remedy in bloody fluxes. La Marek supposes that the Terebinthus of Catesby with lanceolate leaves, and a bluish-violet fruit, is either a distinct species, or at least a well-marked variety. A native of the Well Indies. 2. B. paniculata. La Marek. "Racemes panicked, terminal; flowers purple." Com. Herb. 1c. and MSS. A large tree. Branches below the leaves rough with tubercles and scars. Leaves alternate, unequally winged; leaflets five or seven, ovate-acuminate, entire, smooth, petiolate, with nerves slightly projecting beneath. Flowers small, numerous in panicked, terminal racemes about six inches long. Calyx small, one-leaved, three-lobed. Petals three, longer than the calyx, broad at their base, obtuse at their summit, with a small scarcely discernible point. Stamens five: filaments half the length of the petals, nearly convexit: anthers, brown, oblong, with three furrows. In many flowers, Commerson could not observe any appearance of a pistil, but in others there was a very obtuse stigma in the centre of a kind of receptacle flattened above, and somewhat five-cornered. It produces a reniform juice like the preceding. A native of the Ille de France. 3. B. obtusifolia. La Marek. (Marignia. Comm.) "Racemes panicked, subterminal; leaflets obtuse." A large tree, very reinosus. Leaves alternate, scattered, unequally winged; leaflets five or seven, and sometimes nine, ovate-oblong, obtuse, thickish, coriaceous, smooth on both sides, even and shining above, petiolate, opposite, an inch and half broad, three inches long. Flowers small, very numerous, white: racemes much branched. Calyx very small, with five divisions. Petals five, ovate-lanceolate, expanding, nearly twice the length of the calyx, and attached between its divisions. Stamens ten: filaments very short: anthers small, round, yellowish. Germ round; stigma almost sessile. Fruit, a drupaceous coriaceous berry, about the size of a hazel nut; pulp rather thick, glutinous, and reddish: nuts from one to five, rather thick, convex on one side, angular on the other. A native of the Ille de France.

BURSERIA, Linn. See *Verbena Lappulacea*.

BURSLEM, in Geography, a village of Staffordshire, in England, famous for its pottery, three miles N. of Newcastle under Lyme.

BURSTADT, a town of Germany, in the circle of the Lower Rhine, and electorate of Meutz; two miles E. of Miltenberg.

BURSTEN, a person ruptured, called by physicians hernia; in middle age writers, puerpera. See *Hernia*.

BURTHEN. See *Burden*.

BURTON, William, in Biography, a skilful topographer, and antiquary, was born of a good family at Lindley in Leicestshire, in 1575; and educated at Brazen-Noke college in the university of Oxford. When he left college, he entered for the study of the law in the Temple, and in due time was called to the bar. But as his fortune was small, and his health delicate, he declined pursuing his profession, and retired into the country, where he devoted himself to the study of antiquities, and became eminent in this department. His description of Leicestshire, published in 1622, in a small folio, and republished by William Wittingham of Lynn, in 1777, was one of the earliest county histories, having been preceded by only four others; and from this circumstance it derives its chief reputation. The style of it is flowec and the digressions are numerous. After having been much injured by the civil wars, he died at his seat of Fulke, in Staffordshire, in 1655; and left behind him several MSS. collections of arms, monuments, and other matters of antiquity. His son, whom he named Calibihan, published a translation in verse of Martial's epigrams.

Another William Burton was born in London, and educated at Queen's college, Oxford; and having been Greek lecturer in Gloucester Hall, was constrained by indigence to leave the university in 1630. He afterwards became master of the free grammar school at Kington upon Thames, which office he resigned two years before his death in 1637. Besides his principal work, which was "A Commentary on Antoninus his Itinerary, &c." illustrated with a chorographical map of the several stations," Lond. 1658, folio, he wrote, in Latin, a history of the Peric language and other works, enumerated by Wood in his Athenae. His great-grandfather is said to have expired with excess of joy upon being informed of the death of Queen Mary.

Biog. Brit.

BURTON, Robert, brother of the antiquary, William, was born at Lindley, in 1576, and educated at Brazen-Noke and Christ-church colleges, in the university of Oxford. He retained two preferments in the church, viz. the vicarage of St. Thomas in Oxford, and the rectory of Segrave in Leicestshire, till his death in 1639. He was much addicted to astrology, and is said to have predicted the time of his own death. With the character of a general scholar and hard student, well versed in the pedantic literature of the times, he combined great integrity and benevolence. But his temper was of a humorous and melancholic cast, which gave a singular kind of oddity to his conduct. In order to relieve his melancholy, he diverted himself by listening to the rambles of the bargemen, which seldom failed to occasion vehement bursts of laughter. At other times he was one of the most factious companions in the University. His famous book, entitled the "Anatomy of Melancholy," was composed with a view of soothing his peculiar disposition; and contains chiefly extracts from ancient authors, illustrating the causes, effects, and cure of that morbid affection. The author's own reflections are few; but they are original, ingenious, and striking. To the bookfeller, this work, printed first in 1628 and afterwards frequently in folio, was very profitable. After it had been long neglected and almost forgotten, it attracted notice in consequence of an ingenious essay by Dr. Ferrier of Manchester, who detected among the plagiarism of Sterne, various passages copied verbatim from Burton. The author died in 1639; and the following inscription, written by himself, was put upon his monument in Christ-church: "Paucis notus, paucioribus ignotus, hic jacet Democritus junior, cui vitam detet et mortem melancholia." Biog. Brit.

BURTON, John, a learned divine of the last century, was born...
born in 1676, at Wembourne, in Devonshire, and admitted a scholar of Corpus Christi college at Oxford in 1723; of which he at length became a tutor. In the exercise of this office, he devoted himself with singular affability and zeal to the improvement of his pupils; and he exerted himself in a variety of ways for the advancement of learning. Besides the attention which he paid to academical discipline, he improved the mode of discussing philosophical questions in the schools, and had the honour of introducing the study of Locke, and other modern philosophers, in connection with Aristotle. He also took great pains in promoting classical literature, by frequent lectures both in the Greek and Latin languages; and he extended the utility of the university press for the aid and encouragement of literary undertakings. In 1733 he was elected a fellow of Eton college; and about the same time was presented to the vicarage of Maple-Derham, in Oxfordshire. On this occasion he was induced, by motives of sympathy and compassion, to marry the widow of his predecessor in that living, with the charge of three infant daughters that were left destitute; and though he thus formed a connection which, according to the maxims of the world, would be condemned as imprudent, he found in the event that the choice of a person who possessed every qualification for fixing his attachment, except money, contributed to his future happiness. In this retired station of a country clergyman, he continued for several years; occupying himself in literary pursuits, and in the improvement of his house and grounds, not less for the benefit of his successors than for his own amelioration. After the death of his wife in 1748, an event which deeply affected him, and which he much lamented, he chiefly resided on his fellowship at Eton; where his situation was such in every respect as suited his studious and literary disposition. In 1752 he took his degree of doctor in divinity; and continued to appear occasionally both as a writer and a preacher, much esteemed by the higher and lower classes of his own order, with whom he had frequent and free intercourse, and also by the common people, with whom he associated in the most cordial and affable manner. His leisure hours he amused by poetical exercises. Towards the close of his life he was attacked with a fever, which impaired his intellect, and shattered his deciding frame; but at intervals he seemed to recover the powers both of his body and mind. On the evening of Sunday, the day before his death, he discoursed according to his usual manner, with more than usual perspicuity and elegance, on some theological subject; and after a very serene sleep, he gently departed this life on the following day, February the 11th, 1771, and was buried at the entrance of the inner chapel at Eton. The works of Dr. Burton are chiefly collected in two volumes of Sermons, which are much laboured, of a considerable length, and containing a great variety of matter; an octavo volume of theological disquisitions, entitled "Opuscula Miscellanea Theologiae," and another of "Opuscula Miscellanea Metrical-profatica," comprehending a variety of pieces in Greek and Latin, with two or three copies of English verses. In one of these pieces, entitled "Commetariolus Thomas Seeker, Archbishop. Cantuar. memorie facer," Dr. Burton indulged himself in some severity of animadversion against the divines, on account of their supposed opposition to the settlement of a bishop in America, which induced Dr. Furneaux in his letters to Mr. Justice Blackstone, to vindicate that body of men against the charge brought against them. Dr. Burton was also the author of some other publications besides those contained in the volumes above-mentioned. In 1744 he published at Oxford, in large 8vo. "The Genuineness of Lord Clarendon's History of the Rebellion, printed at Oxford, vindicated," in which he fully refutes the slander that had been advanced by Oldmixon, in his Critical History of England. In 1758, appeared his "Dissertatio et Notae Criticæ respectant ad Tragédias quaedam Graecas, editas in Pentalogia." The publication of the five select tragedies, which constitute the "Pentalogia," had been recommended to him by a pupil of promining talents, Joseph Bingham, who had printed almost the whole text and notes, when in 1756 he was cut off by a premature death. Dr. Burton has added a preface, dissertations, and additional notes. This work has been reprinted at the Clarendon press, and is much esteemed as a book for students in Greek. In 1766, Dr. Burton published a discourse, entitled, "Papists and Pharisees compared, or Papists the corrupers of Chriftianity," occasioned by Philip's life of Cardinal Pole. About the same time he also delivered a set of sermons, in MS.; the design of which was to refute the articles of the Council of Trent. He is also underlived to have been the author, under the name of Philletheus Louisenof, of "The Remarks on Dr. King's Speech before the University of Oxford, at the dedication of Dr. Radcliffe's library, on the 13th of April, 1749;" to which Dr. King replied in his "Elegium famæ intimans Jacei Etonensis, or Gigantis; or, the Prais of Jack of Eton, commonly called Jack the Giant; collected into English metre, after the manner of Thomas Sternhold. John Hopkins, John Burton, and others. To which is added, a Dissertation on the Burtonian Style, by a Master of Arts." But the most severe attack on Dr. Burton's style, as affected and pedantic, was that of Churchill in one of his poems, (works, vol. iii. p. 124,) who has exercised all the uncandid severity of his pen to expel it to ridicule. However, prejudice cannot deny, that Dr. Burton was "an able divine, a found scholar, and an excellent academic; and that he fed an useful example to university-men, whether as fellows, tutors, officers, or editors. In short, his abilities, virtues, and learning were such as fully entitle him to have his name transmitted with honour to posterity." Biog. Brit.

BURTON, JOHN, the scholar of Keele, a harpischord player, with a powerful hand, and much enthusiasm in his art; but having in his youth exercised his hand more than his head, he was not a deep or correct contrapunctist. He had, however, in his pieces and manner of playing them a style of his own, to which, from his having been one of the first harpischord players in our country, who attempted expression and light and shade, he excited an interest and attention, which would now perhaps be much more difficult to obtain.

Travelling into Italy, with Mr. Beckford, at the time when the Malapria raged, he became a victim, about 1779, to the imprudence of passing from Rome to Naples on the verge of the Pontine marshes, in spite of the admonitions of the native inhabitants.

BURTON, or BURTON in Kendal, in Geography, a small market-town on the borders of Lancashire, in the county of Westmoreland. Here are some good houses and two large inns, situated on the great turnpike road. It derives some advantages from travellers; and from the canal, lately brought here, by which a commercial communication is opened with the rivers Dee, Mersey, Trent, Derwent, Humber, Severn, &c. Here are a small market on Tuesdays, and one fair annually. It is 251 miles N.W. from London, and contains 138 houses, and 548 inhabitants. Houftan's Topographical Description of Cumberland, &c. Svo. 1800.

BURTON-upon-Trent, is an ancient and large market-town of Staffordshire, England. It is situated in a pleasant and fertile valley on the banks of the river Trent, which separates
rates this part of the county from Derbyshire. This town has long been celebrated for its ale breweries and malt-houses. The Burton ale is a beverage in high repute at most of the large towns of England, and is exported to different places on the continent. It is commonly of a thick and glutinous quality, of a sweetish taste, and a small quantity produces inebriation with those persons not accustomed to it (vide ALE). Among the manufactures of this place are hats, which are made in large quantities for the army, navy, &c.; srews, fpades, and other iron utensils, are also made here; as are some tammies and woollen cloths. Three extensive cotton manufactories are established in the vicinity of the town; and about half a mile distant, on an island, is a considerable forge, for converting bloom and scrap iron into bars. The river Trent has long been made navigable from Gainsborough to this town for boats of large burthen. The Burton boat company are proprietors of this navigation, and of many boats on the grand trunk canal. This packet parallels with the town, and at about one mile distance communicates with the Trent.

Burton, in the time of Leland, had "one parish church, a chapel at the bridge end," and was noted for its marble and alabaster works. Here is a long bridge of 36 arches, which crosses the Trent, and was, according to Mr. Gough, "built in the time of Henry II., or earlier." The parish church, built in 1722, adjoins the abbey, which was founded by Wulftric Spot, in 693, for Benedictines. Some of its ancient walls remain, but are altered and fitted up as the manor house. Its abbot had a large piece of hilly ground, about one mile from the abbey, which he called Sinai. This hill bears the name of Sinai park. Burton was formerly ornamented with a caille, which, Mr. Gough says, was built by one of the Terris' family, in the time of the Conqueror. Here are a free-school, two almshouses, and a town-hall, the latter of which was built, in 1772, by the earl of Uxbridge, who is lord of the manor, and holds his courts-lect, &c. in this structure. The town has, within a few years, been greatly improved by the paving and lighting of its streets. It has a large market on Thursdays, and four fairs annually, one of which continues for five days, and is noted for its large shew of horses. Burton is 125 miles N.W. from London, and contains 738 houses, with 3678 inhabitants, the greater part of whom are engaged in trade and manufactories. Gough's edition of Camden's Britannia, vol. ii. Shaw's History of Staffordshire.

Burton, a small township of America, in Grafton county, New Hampshire, incorporated in 1736, and containing 144 inhabitants. Also, a township in the British province of New Brunswick, situated in Sunbury county, on the river St. John.

Burton, in Sea Language, a small tackle consisting of two fiddle blocks, and a rope passing through them, until it becomes three or four-fold. It is employed in loading or discharging goods, as bales, casks, &c. and in removing the anchors, or any weighty body, on deck, in setting up the top-mast rigging, &c.

BURUGERD, in Geography, a town of Peru, in the province of Irak-Agemi; 92 miles S.E. of Amadán.

BURULUK, a town of Russia, in the government of Vorontz; 60 miles S.W. of Vorontz.

BURUN, a town of European Turkey, in the government of Romania; 50 miles E. of Emboli.

BURUNNIUTAPCHARA, a cape in the Caspian Sea, 112 miles S. of Gurgiev. N. lat. 52° 50'; E. long. 65° 14'.

BURWAH, a town of Hindoostan, in the country of Bahar; 153 miles S. of Patna. N. lat. 23° 10'. E. long. 84° 30'.

BURY, is sometimes used to denote the hole or den of some animal under ground. See Burrow.

In which sense we say the bury of a mole, a tortois, or the like. The geology, or mole cricket, digs itself a bury with its fore-tect, which are made broad and strong for that purpose. Naturalists speak of a kind of urchins in the island of Maraguan, which have two entries to their buries, one towards the north, the other to the south, which they open and shut alternately, as the wind happens to lie.

Bury, in Geography, a market town of Lancashire, England, is seated in a fine valley on the banks of the river Irwell, at the distance of 155 miles N.W. from London, and 9 miles N. of Manchester. Situated in the midst of a great manufacturing district, most of its houses and inhabitants are appropriated to and engaged in the cotton works. Leland mentions Bury as being only a poor market-town in his time, but it has now acquired considerable wealth and commercial importance; which has partly arisen from the landable exertions of Sir Robert Peel bart., who, having a seat at Chamber-hall in this neighbourhood, has established and promoted some large manufactories for calico printing, &c. The principal of these works, under the firm of Peel and Co. are situated on the side of the Irwell, from which they have large reservoirs of water.

The cotton manufactories, which are now so very flourishing in this district, appear to have been brought hence from Bolton in Yorkshire. Since their establishment at Bury, they have been greatly facilitated and promoted by means of various scientific and mechanical contrivances, which fir Robert Peel has encouraged. Among the inventions that have been brought forward under his patronage, is one called the wheel, or flying shuttle, which was first made by Mr. Robert Kay. This engine is calculated to make several cards at once. It straightens the wire out of the ring, cuts it into lengths, folds it, crooks it into teeth, picks the holes in the leaf, puts the teeth in, row after row, and performs the whole with a single operation of the machine, in an expeditious manner, by one person turning a shaft.

The parish of Bury is large, and divided into six townships, and has four chapels of ease, besides a modern handsome church in the town. The presbyterians, independent, and methodists have also places of worship. Here is a handsome free-school, well endowed, and provided with two masters: also a charity school for boys and girls. About one half of the town is leafield, under the earl of Derby, and the remainder is glebe belonging to the rectory. The living, in the gift of that earl, is rendered very valuable from the following circumstance: an act of parliament passed in 1764, empowering the rector, for the time being, to grant building leases for 99 years, renewable at any intervening period, on an agreement between the parties. The relative population of Bury, and its present extent, may be estimated from comparing the accounts of each in 1773 and 1831. In the former period there were 643 houses and 2090 inhabitants, and at the latter, according to the report of the house of commons, 1384 houses and 7672 inhabitants.

According to tradition there were two castles in and near this town. Indeed, its name partly confirms this; and at the west end of the town is a field called Castlecroft, where foundation walls have been dug up. At Castlefield in Walsall was an encampment; and near it is an eminence called Castle-hill. Aikin's Description of the Country round Manchester, 420. 173.
feated on the side of a hill, which slopes gently to the river Lutke. This place obtained its present name and principal importance from the relics of King Edmund, who being barbarously murdered by the Danes at Hornea in this county was proclaimed a royal martyr, and his shrine became an object of great veneration in the time of British monarchism. Though a monastery had been previously founded here by Gugbert, king of the East Angles, yet it does not appear that this monarch’s establishment excited any notoriety, or attracted many inhabitants. The abbey founded here in honour of St. Edmund, was raised by Aylwin, about the year 989, but was afterwards augmented by additional endowments, and enlarged in buildings. Nearly the whole was, however, destroyed by Sweyn king of Denmark, whose son Canute rebuilt the abbey, and restored the town to its former importance. Previous to this event, it appears that the town was known by the name of Deodriskworth. Canute offered up his crown at the shrine of St. Edmund, as did many other English kings, his successors. The church and monastery appear to have been rebuilt in the year 1020, and the former was consecrated on St. Luke’s day, A.D. 1032, by Agelnothus, archbishop of Canterbury. From this period it grew into great repute, and several monarchs, with many eminent persons, were desirous of being interred in this holy place. During the prosperity of the abbey, it was environed with a strong wall and ditch, and there was an hospital, or religious house, at every gate of the town. Among these the abbey-gate, or entrance to the abbott’s palace, is the principal structure remaining; and this is an interesting relic of architectural antiquity. It was erected in the reign of Richard II. about the year 1357, and at present is a good state of preservation. Its western front is adorned with several niches and carvings in tabernacle work, &c. Another of these structures, called Church-gate, or the portal, is remaining, and formerly led to the grand central church. It now serves as a tower to St. James’s church, and is supported on two semicircular arches, which admit of a free passage for carriages.

The town of Bury St. Edmunds, with its suburbs, extends from north to south, about 1½ mile, and in breadth ¾ mile. It is divided into five wards, and contains 34 streets, which are well paved, and intersect each other at nearly right angles. While the abbey was standing, there were three churches within its precincts, besides the one belonging to the monastery. That dedicated to St. Margaret is now made use of, with considerable alterations, as the shire-hall, where the county affaires are held. The two other churches “are defervedly esteemed for their exact and beautiful symmetry, their large and elegant windows, neat pillars, and noble roofs.” In the church of St. Mary, it appears that Mary Tudor, third daughter of Henry VII., and wife of Lewis XII., king of France, was interred. After the decease of the latter monarch, the married Charles Brandon, duke of Suffolk, and died in his life-time at Westminster in this county.

Bury has, at different times, been the seat of the English sovereign, and the place of assembling his parliaments. King Edward I. and Edward II. had mints here; and Stow says that here was also a mint in king John’s time. Among the other public buildings and establishments of the town, are the guildhall, the wool-halls, the gaol, the bridewell, the theatre, the market-cross, the butchery, and new shambles, the subscription-rooms, the free grammar school, and four meeting-houses.

Bury has the privilege of three annual fairs, one of which usually continues for three weeks. Here are also two

weekly markets on Wednesdays and Saturdays. In 1753, the number of inhabitants in this town was 5,819, and in 1851, they appear to have increased to 7,655. Though the population has thus evidently greatly increased, yet at some former periods many inhabitants have been swept away by the plague, &c. Mr. Nicholls, in his History of Leicestershire, states that 1603 persons died of the plague in Bury in 1349; and in 1638 upwards of 600 persons died of this dreadful calamity.

Lury was first privileged to send members to parliament by King James I., who incorporated it in the fourth year of his reign; and by two other charters in the sixth and twelfth years of his reign. The right of election is vested in the aldermen, burgesses, and common-councilmen, amounting to 37.

Gillingwater’s Historical and Descriptive Account of St. Edmund’s Bury, 12mo. 1804.

BURYING alive, was, among the Romans, the punishment of a veiled (see VESTA), for the violation of her vow of chastity. After being tried and sentenced by the pontifices, this punishment was inflicted and accompanied with funeral solemnities in a place called the “Campus Scle- ratus,” near the Porta Collina; and her paramount was scourged to death in the Forum. The unhappy priestess was let down, on this occasion, into a deep pit, with bread, water, milk, oil, a lamp burning, and a bed on which to lie; but this was mere show, for the moment she was at the bottom, they began to cast in the earth upon her, till the pit was filled up. Mem. Acad. Infer. t. iii. p. 278. This mode of punishment is said to have been first devised by Tarquinus Prifceus. Diony. iii. 67. Lord Bacon mentions instances of the resurrection of some persons who had been buried alive. Of this number was the famous Duns Scotus. See DUNS. For the places and different modes of burying, see Bury.

BURZANO, in Geography, a town of Naples, in the province of Calabria Ultra; 10 miles E.N.E. of Bova.

BURZETI, a town of France, in the department of the Ardeche, and chief place of a canton in the district of l’Argentiere. The place contains 2670, and the canton 4945 inhabitants; the territory comprehends 110 kilometres and 4 communes.

BUS, CESAR DE, in Biography, the founder of the Fathers of the Christian doctrine, was born at Caivalion in 1544, and after pursuing, for some time, a licentious course, became sensible of his misconduct, entered into the church, and was appointed canon of a cathedral. Adopting a rigorous mode of living, and distinguished by his zeal in instructing the ignorant, and exhoriating sinners to repentance, he formed a new institution for teaching the principles of the Christian religion. See Fathers of the Christian doctrine. De Bus left his sight some years before his death, which happened at Avignon in 1607. To him is also ascribed the establishment of the Ursulines in France. He published a set of “Familiar Instructions on the Christian Doctrine,” written in a simple style, and still read by pious persons. Nouv. Dict. Hist. Molins. Eccl. vol. iv.

BUSANCY, in Geography, a town of France, in the department of the Aisne, and district of Soissons; 4 miles S. of Soissons.

BUSARD, in Ornithology. See Moor BUZARD.

BUSBEC, or BOSBEK, AUGHER-GHISLEN, in Latin Bifboquins, in Biography, a celebrated traveller and ambas- sador, was the natural son of Gilissen, lord of Boscue, a village on the Lys, and born at Commines, in Flanders, in 1522. Having been legitimated by a rescript of the emperor Charles V., he pursued his studies with great diligence and
and success, in some of the most celebrated universities of Europe. He accompanied the ambassador of Ferdinand, king of the Romans, to England, and was present at the marriage of Philip and Mary; and was appointed by this sovereign, when he became emperor, as his ambassador to Sultan Solyman II. During his seven years' residence in the Turkish dominions, he acquainted himself with various particulars relating to the natural and political history of the country, and collected a great number of MSS. and inscriptions, together with drawings of plants and animals, which, from his return, to form a narrative, written in Latin, and abundantly with valuable information. He was afterwards entrusted with the education of the sons of Maximilian II., and in 1570, conducted this emperor's daughter to France, on occasion of her marriage with King Charles IX. After the death of Charles, he continued in that country as ambaassador for the queen-dowager, and also for the emperor Rodolph, till the year 1592. Having obtained permission to take a journey into the Low Countries, he was assaulted in Normandy by a party of soldiers belonging to the garrison of Rouen, and the treatment he suffered produced a degree of irritation, which terminated in a fever that proved fatal to him at the house of a lady near Rouen, in 1592. He was a man of extensive literature, and master of seven languages. The first copy of the famous "Monumentum Ancyranum," which he caused to be transcribed at Ancyra, was brought by him into Europe. Besides his "Travels in the East," he wrote "Letters from France to the Emperor Rodolph," which exhibit an interesting picture of the French court at that period. An edition of all his works was published by Elzevir at Leyden in 1633, and at Amsterdam in 1660, in 40. Gen. Dict.

BUSBY, Richard, an eminent school-master, was born at Lutton, in Lincolnshire, in 1606, educated at Westminister school as a king's scholar, and elected student of Christchurch, in 1624. At college he was esteemed a great master of the Greek and Latin languages, and a complete orator. Having taken orders, he was admitted, in 1639, to the prebend and rectory of Culworth, in the church of Wells; and in 1640, he was appointed master of Westminister school, which office he held with singular reputation for 55 years. His talents for this arduous office have been greatly extolled; though it does not now appear what was his peculiar and discriminating excellence. It has been said that he possessed a singular facility in discovering the appropriate genius of his pupils, and that he so much approved an early manifestation of wit in his scholars, as to pardon the impudent exercise of it, when he himself was its object. Perhaps, his pre-eminence to others who have occupied similar stations might have principally confided in the firmness and vigour of his mind, and in that kind of uniform and systematic discipline, attended with a considerable degree of severity, which commanded awe and maintained order. With a reference to this trait of his character, Sir Roger de Coverley (see Spectator, No. 329.) is made to exclaim, at the view of his effigies, "Dr. Busby; a great man! he whipped my grandfather; a very great man!" Pope also gives us a lively delineation of a master belonging to the Buckhian class, or of the "Genius of the public Schools," in the following appropriate lines:

"When lo! a spirited rose, whose index-hand
Held forth the virtue of the dreadful wand;
His beard'd brow a bishop garland wears,
Dropping with infant's blood, and mother's tears.
O'er every vein a shudd'ring horror runs;
Eton and Wiston flake through all their sons.

All flesh is humbled; Westminister's bold race
Shrink, and confess the genius of the place;
The pale boy-fenator yet tingling flames,
And holds his breeches close with both his hands."

Dunciad, B. iv.

Dr. Busby, however, though his fame has descended to us as that of a strict and severe disciplinarian, was not an ill-natured man; but the severity which he exercised, and which has almost become proverbial, seems to have been the result of habit and custom. It has, indeed, been animadverted upon with disapprobation by some modern writers, not only as unjustifiable, but as tending to the extreme of cruelty. Somewhat to this purpose is the reflection of Mr. Knox, in his essay on parental indulgence (Elays, vol. ii. p. 344.) who says, "Inhumanity even in a Buxby cannot admit of palliation." As a man of learning, Dr. Busby is known by several books, such as Latin and Greek grammars, and editions of the fables of Juvenal and Periplus, and of the epigrams of Martial, adapted to the use of his school, and evincing his skill and accuracy as a grammarian. After the restoration, he was made a prebendary of Westminister, as well as treasurer and canon-residentiary of the church of Wells; and in the same year he also took his degree of doctor in divinity. To the church and monarchy he was zealously attached, and he infused similar principles and spirit into the minds of his pupils, among whom were several who occupied some of the highest offices in the state. Several instances of his private and public charity are recorded. Having, by a course of temperance, notwithstanding the fatigues of his public station, attained to the advanced age of 80, he died in 1695, and was buried in Westminister abbey, where a monument, with an ample, laudatory inscription, was erected to his memory. Biog. Brit.

BUSCA, in Geography, a town of Italy, in the province of Coni; 7 miles W. of Coni.

BUSCHE, Herman Von Dem, in Latin Buschius, in Biography, a distinguished scholar, who contributed to the revival of literature, and the improvement of taste in Germany, was the descendant of a noble family in Westphalia, and born at the castle of Sassenburg in the bishopric of Minden, in 1468. After a previous course of study improved by travels through Italy, France, and Germany, and various attempts to excite among his own countrymen a taste for pure Latinity, he established a school at Cologne; but here his residence was made uneasy to him by the monks, so that in 1506 he removed to Leipzic. The ecclesiastics, however, whose Latin style he condemned, and which he wished and laboured to reform, counteracted his efforts of improvement, and he was under a necessity of often changing his abode. At Cologne, whither he returned after his travels in Germany and the Low Countries, he published "Pemptades Decimationum Praetenturam," and a "Commentary on Claudian de Rupto Proferpicis." The clergy again molested him in this city, as he had given them frequent occasion of offence by aiding Ulric Von Hetton in composing the celebrated "Epithalamium Virtutum," in which the monastic Latin of that period is the subject of ridicule. From Cologne, he removed to Wefel, where, as rector of the Latin school, he read the works of Luther, Melancthon, and Pomersonus, which had been just published. From Wefel, he went to Wittenberg; and, at the recommendation of Luther and others, the landgrave of Hesse appointed him professor of history at Marburg, where he published "A Treatise on the Authority of the Word of God." About this time he embraced the doctrines of Luther, and married in the year 1527. Towards the close of his life, he
he had an unhappy quarrel with the anabaptists at Munster, which agitated a conlilution, already enclosing by years, to fach a death, as to occasion his death, in 1744. His principal works are "Commentar. in Donatam"; "Annot. ad Solum Han-ricianus"; "Comment. in primum lib. Martianum"; "Scholia in Satirum"; "Annot. ad Juvenalum"; "Epigrammata libri ivii," "Comment. in Satyr. Periplus," Paris, 1641. He also published many Latin poems. According to the account, given of his writings by Brahms, they are fervent, lively, and animated, and display great acuteness of judgment; and his style is laid to approach nearer to that of Quintilian than to that of Cicero. Gen. Bio.

BUSCHETTO, DA DULICHO, a celebrated Greek archi-
tect, was a native of the island of Dulichio, and employed, in 1016, by the republic of Pisa, in building and ornamenting their dome or cathedral church; which he enriched with many marble columns, and which has ever since been reckoned one of the most sumptuous edifices in Italy. He died at Pisa, where was erected a monument to his memory, bearing an inscription which intimates his extraordinary knowledge of the mechanic powers. His disciples were numerous, and he is regarded as the principal founder of the science of architecture in modern Italy. Tellbien, Vies des Archit.

BUSCHING, ANTHONY-FREDERICK, a well-known

geographer, was born at Stadthagen, a town of Germany, in 1744, and instructed for several years by Hauber, afterwards pastor of a German congregation at Copenhagen, in the Greek, Chaldæan, and Syrian languages, and also in astronomy, algebra, and other branches of the mathematics. In 1734, he entered as a theological student at Halle, where he derived singular benefit from the patronage of the celebrated professor S. J. Baumgarten; and in 1745, he published his first work, which was "An Introduction to the Epistle of Paul to the Philippians," with a preface by his patron. At the close of his academic studies he began his practical lectures on Íthet, which were followed by those on the New Testament. In 1748, he was invited to super-

intend the education of the eldest son of count Lymar, at Kolbritz; where he was also employed in revising a Ger-
mun edition of Vitringa on Íthet, and where lie commenced an extensive correspondence with persons of eminence in the literary world. In the following year he accompanied count Lymar to Peterburgh; and in the course of his jour-
ythy thither lie formed the plan of a new geography, with a view of supplying the imperfections of Hubner's and Hager's works on this subject. After encountering some difficulties and discouragements in the progress of his undertaking, lie determined to devote his whole time to it; and releasing himself from his engagements as tutor, repaired, in 1752, to Copenhagen, where he enjoyed peculiar advantages for the complection of his work. During his residence in this city, he conducted a monthly publication, in which he gave an account of the state of the arts and sciences in Denmark. In 1754, he removed to Germany, and at Halle wrote a dis-

sertation entitled "Vindiciae Septentrionis," announcing his intention to commence a course of lectures on the constitution of the principal states of Europe; but he was diverted from prosecuting this plan by an invitation to the office of extraordinary professor of philosophy at Gottingen, with a salary of 200 rix-dollars to enable him to finish his geography. Accordingly, he accepted the invitation, and having settled at Gottingen, in 1754, he married in the following year a literary lady, several of whose poetical pieces he had previously published. This lady had been elected an honorary member of the German society at Gottingen, and had also been named imperial poetæ laureat by Haber-
lein, pro-rector of the university of Helmstatt. In the

prospect of a vacancy in the chair of theological professor in the university of Gottingen by the death of Motheim, Busching was advised by his friends, in 1755, to offer himself as a candidate; but as he had conceived a dislike to the theology of the schools, he thought it most honourable to announce his sentiments to the public, before he undertook the office of theological professor. Accordingly, on occasion of his applying to the theological faculty of Gottingen for the degree of doctor, he delivered to them, in M.S., his "Epitome theologicae fœlis fœris litteris concinnatae. ab omnibus rebus & verbis scholasticiis purgatae," which he afterwards printed; and, after some opposition, he obtained the degree. This dissertation was afterwards reprinted with additions; and as it contained some points of doctrine that were thought exceptional, he was accused of heterodoxy, and ordered by a refeript, issued in 1757, to "forbear publishing any thing on the subject of theology, till it had been submitted to the inspection of the privy-council of Hanover; and he was also commanded to abdize from giving theological lectures, particularly on disputed subjects. He remon-

strated against this treatment, and in a letter to Motheim, the Hanoverian minister, he expressed his purpose in the fol-

lowing declaration: "If your excellency should make me chancellor of the university, with a salary of a thousand dol-

lars, on condition of my teaching nothing but the usual theology of the schools, I would respectfully refuse your offer." At this time Busching had a salary of 400 dollars at Gottingen, besides pecuniary presents from the minister, and some privileges, which enabled him to expedite his great geographical works. In 1759, he was appointed public pro-

fessor of philosophy, and the first part of his geography had already gone through three editions. He was now at leisure to prosecute it; and, that he might not be interrupted, he declined accepting several advantageous offers. On the sub-
ject of education he had published a treatise, compiled from his lectures at Gottingen, which very much contributed to his reputation. In 1761, he undertook the office of professor to a Lutheran congregation at Peterburgh; and here he founded a school on a large scale for the benefit both of boys and girls. To this school he paid particular attention; and in 1755, it had risen to such reputation, that it con-
tained upwards of 200 scholars of various nations and sects; and Catharine II. granted to it, by the recommendation of field-marshall count Munich, several privileges. But on oc-
casion of a dispute between Busching and his congregation respecting this new institution, he abandoned the direction of it, and determined to return to Germany; though the empress Catharine was very desirous of retaining him in Rußia. Among other connections which he formed during his residence at Peterburgh, he contracted an inti-

macy with Müller, the celebrated historian and traveller; and from the information he thus obtained with regard to Rußia, he was enabled to publish his "Historical Maga-

zine." The place which he selected for his residence, with a view to the prosecution of his literary labours, was Altona; and here he continued, declining some advantageous proposals, made to induce his return to Gottingen, and refusing never to accept a pension, till the year 1766, when he was appointed director of a gymnasium at Berlin. In this capital he was treated with great respect; and besides the employment of superintending the seminary committed to his care, he en-
gaged in writing various elementary treatises for the use of the different classes in the Latin and French languages, na-

tural history, the history of religion, the fine arts, &c.; which were favourably received by the public. His inef-
fant application, however, impaired his health, and brought on a pulmonary complaint with which he was afflicted for several
several years, and which terminated his useful life, in 1793, after he had been director of the gymnasium at Berlin for 29 years. He was buried in his garden at mid-night, without pomp or ceremony, according to his own desire expressed in his will. In his own delineation of his character, he acknowledged, that though he was candid and open-hearted, affable, ready to assist others, and of a compassionate disposition, he had behaved with harshness to many persons, and on various occasions. He expresses his confidence in the Supreme Being, his firm faith in the Saviour of the world, and his satisfaction with the dispensations of providence. His temper, he says, was warm, and occasionally irritable; and his firmness had sometimes assumed the appearance of obstinacy; and his quickness had betrayed him occasionally into precipitation. “I am moderate,” says he, “in all things; contented with little, and master of my appetites. In my intercourse with the world I expect too much from myself; I am therefore often dissatisfied with my own conduct; and on that account wish to confine my intercourse within a very narrow circle, and to thin society. I am free from pride, but not void of ambition, though I often struggle with this passion, and on reflection endeavour to suppress it. I am so much attached to labour, that it seems to me a requisite to life, and that my impulsion to it is greater than to any transient pleasure whatever.”

Bushwhacking was a ready writer, so that his literary productions amounted to more than a hundred, consisting of elementary books, relating to schools and education, and such as were theological, historico-geographical, and biographical. Although his works confer considerable merit, they abound with repetitions, and his style is diffuse and inelegant. But the department in which he principally excelled was that of geography. His “Geography” comprehending Europe and the Russian part of Asia, contains a variety of interesting and useful information; and was published after the year 1754, at different periods, in single volumes, of which eight editions were published during the life of the author. His “Magazine for Modern History and Geography” was comprised in 22 parts, 440, and published between the years 1767 and 1788: and his “Weekly Account of Mr. Map’s” appeared in detached parts, during an interval of 13 years, from 1773 to 1787. Gen. Biog.

BUSCHOFF, in Geography, a town of the Duchy of Coultre; 8 miles S. of Seeburg.

BUSCHWEILER, a town of France, in a district of the same name, in the department of the Lower Rhine, formerly Afflacht.

BUSE, in Ornithology. See Falco Buteo.

BUSELAPHUS Cajus, in Zoology. See Antilope Eubalis.

BUSENTO, in Geography, a river of Italy, which runs into the sea, near Polichino.

BUSEY, a town of the island of St. Domingo, situate near Port-au-Prince, and having a fort.

BUSH, a tufted or thickly covered mass of boughs or branches.

Bush also denotes a crowned frame of wood hung out as a sign at taverns. It takes the denomination from hence, that, anciently, signs where wine was sold were bushes chiefly of ivy, cypress, or the like plants, which keep their verdure longest, and hence the English proverb “Good wine needs no bush.”

Bush, in Geography, the name of a river in Ireland, which after taking a winding course through the northern part of the county of Antrim, falls into the north channel about a mile west of the Giant’s Causeway.

Bush-harrow, in Agriculture, an implement constituted

of any sort of bulky wood, interwoven in a kind of frame consisting of three or more crooks bars, fixed into two endpieces in such a manner as to be wider behind than before, and very rough and bulky underneath. To the extremities of the frame before are generally attached two wheels, about eight or twelve inches in diameter, upon which it moves; sometimes, however, wheels are not employed, but the whole rough surface is applied to, and dragged on the ground. See Harrow.

Bush-harvesting the operation of harrowing with an influence of the kind described above. It is chiefly necessary on grazed-land, or such as has been long in the state of pasture, for the purpose of removing the worm-calls and of breaking down and reducing the lumps and clods of the manures that may have been applied, and thereby rendering them more capable of being washed into the ground, or, in some measure, for removing the mossy matter that may have formed on the surfaces of such lands.

A rather dry time should be chosen for the performing of the busheif, in order that these substances may be in a more pulverizable state, and of course more readily broken down and applied to the roots of the grazed plants. It should never be attempted when there is such a degree of moisture as to produce clodginively.

Bush-vetch, a plant of the vetch kind, which may probably be cultivated to advantage by the farmer, where lucerne and other plants of a similar nature cannot be grown. It is observed by Mr. Swayne, in the third volume of the letters and papers of the Bath Society, that “its root is perennial, fibrous, and branching; the stalks many, some of them shooting immediately upwards, others creeping just under the surface of the ground, and emerging, some near to, and others at a considerable distance from the parent stock. The small oval leaves are connected together by a midrib, with a tendril at the extremity; the flowers are in shape like those of the common vetch, of a reddish purple colour; the first that blossoms usually come in pairs, afterwards to the number of four at a joint; the pods are much shorter than those of the common vetch, larger in proportion to their length, and flatter, and arc of a black colour when ripe; the seeds are smaller than those of the cultivated species, some speckled, others of a clay colour.” Being a perennial plant, it should be seen, he thinks, “to be a very proper kind to intermix with grass seeds for laying down land intended for pasture; and that it is as fitly entitled to this epithet as any herbaceous plant whatever, having observed a patch of it growing in one particular spot of his orchard for 14 or 15 years past. It is not only a perennial, but an evergreen; it shoots the earliest in the spring of any plant eaten by cattle with which he is acquainted, vegetates late in autumn, and continues green through the winter, though the weather be very severe; add to this, that cattle are remarkably fond of it.” See ViCIA.

These peculiarities should make it particularly valuable to the farmer as a green food for sheep in the winter and spring, when food of that denomination is so exceedingly scarce.

The fame writer has likewise observed, that, “the chief reason which has hitherto prevented its cultivation has been the very great difficulty of procuring good seed in any quantity. The pods,” he finds, “do not ripen altogether; but as soon almost as they are ripe, they burst with great elasticity, and scatter the seeds around; and after the seeds have been procured, scarce one-third of them will vegetate, owing, as he supposes, to an internal defect, occasioned by certain infections making them the nBs and food for their young.”
Du-Cange derives the word from *bufellus, bufellas, or bis-
fellus*, a diminutive of *bus, or busa*, used in the corrupt
Latin for the same thing: others derive it from *bufalus, an
urn*, wherein lots were cast; which seems to be a corruption
from *busus*.

*Bufellas* appears to have been first used for a liquid mea-
Sure of wine, equal to eight gallons. "Odo libre faciunt
galones vini, & octo galones vini faciunt buffellum
London, quod est octo pars quartae." The word was soon after
transferred to the dry measure of corn of the same quan-
tity. — "Pondus octo librarum frumenti facit buffellum, de
quibus odo conficit quartarium."

By 12 Hen. VII. cap. 5, a bushel is to contain eight gal-
loons of wheat: the gallon, eight pounds of wheat; tro-
lyph-weight; the pound, twelve ounces troy-weight; the ounce,
twenty shillings; and the shilling, thirty-two grains, or corns
of wheat growing in the middle of the ear.

This standard bushel is kept in the Exchequer; when, be-
ing filled with common spring water, and the water measured
before the houfe of commons in 1669, in a regular pa-
rallelpiped, it was found to contain 2143.6 fold inches;
and the said water, being weighed, amounted to 11 13 ounces
and 1 penny weights troy. Grevcs, Orig. of Weights,
P. 25.

By act of parliament made in April 1697, it was deter-
mined, that every round bushel with a plain and even
bottom, being made 15 inches wide throughout, and 8
inches deep, should be esteemed a legal "Winchester buffel,"
according to the standard in his majesty's exchequer. A
veil thus made will contain 2150.42 cubic inches; and
consequently the corn gallon contains only 2083 cubic inches.
Ward's Mathematics, p. 36.

Besides the standard or legal bushel, we have several local
bushels, of different dimensions in different places. At
Abingdon and Aredor, a bushel contains nine gallons;
At Appleby and Penrith a bushel of peas, rye, and
wheat, contains 16 gallons; of barley, big, malt, mixt
malt, and oats, 20 gallons. A bushel contains at Carlile,
24 gallons; at Chelte, a bushel of wheat, rye, &c.
contains 32 gallons, and of oats 40; at Dorchester, a bushel
of malt and oats contains 20 gallons; at Pembury, the
bushel of bricken malt is 16 gallons; of other things 20,
and usually 21 gallons; at Kingston upon Thames, the
bushel contains eight and a half; at Newbury, 9; at
Wycom and Reading, eight and three fourths; at Stamford,
16 gallons. Hearne, Collect. tom. i. p. 36, p. 44.

At Paris, by the old measure, the bushel was divided into
two half bushels; the half bushel into two quarters; the quar-
to into two half quarters; the half quart into two litrons;
and the litron into two half litrons. By a sentence of the
pro-
voit of the merchants of Paris, the bushel was to be eight
inches two lines and an half high, and ten inches in diameter;
the quart four inches nine lines high, and six inches nine
lines wide; the half quart four inches three lines high,
and five inches in diameter; the litron three inches and an
half high, and three inches ten lines in diameter. — Three
bushels made a minot, six a mine, twelve a septer, and an
hundred and forty-four a muid.

In other parts of France, the bushel varied: fourteen one
eight bushels of Amboise and Tours made the Paris sep-
tier. Twenty bushels of Avignon made three Paris sep-
tiers. Twenty bushels of Blois made one Paris septier.
Two bushels of Bourdeaux made one Paris septier. Thirty-
two bushels of Rochel made nineteen Paris septiers. "Oats
were measured in a double proportion to other grains;
so that twenty-four bushels of oats made a septer, and
268 a muid. The bushel of oats was divided into four pi-
cotins,
cotious, the picotin into two half quarts, or four litrons. For salt, four bushels made one minot, and fix a peck. For coal, eight bushels made one minot, sixteen a mine, and 320 a muid. For lime, three bushels made a minot, and forty-eight minots a muid. See Measure and Weight.

By 31 G. III. c. 30, the bishul by which all corn shall be measured and computed for the purposes of this act, shall be the Wincheller bushel, and a quarter shall be deemed to consist of 8 bushels: and the justices of each county, and the mayor of such cities and towns as are counties of themselves, or enjoy exempt jurisdictions, and from which returns are by this act directed to be made, shall cause a standard Wincheller bushel to be provided and kept; and all measures shall be computed by the hricken and not by the heaped bushel: and where corn shall be sold by weight, 47 lb. avoirdupois of wheat shall be deemed equal to one Wincheller bushel; and 55 lb. of rice; 40 lb. of barley; 42 lb. of beer or biggs; and 35 lb. of oats; and further, 50 lb. of wheat-meal; 45 lb. of wheat-flour; 5 lb. of rice-meal; 4 lb. of barley-meal; 4 lb. of beer or bigg meal; and 2 lb. of oat-meal, shall be deemed equal to every bushel of corn unground. And for the more easy measuring ground corn in sacks, the proper officer may make choice of and weigh two sacks out of any number not exceeding twenty, and so in proportion; and thereby compute the quantity of the whole. And the inspector of corn returns shall make a comparison between the Wincheller measure and that commonly used in the city or town for which he is inspector; and within one month after his appointment, shall cause a statement in writing of such comparison to be hung up in some conspicuous place in the market and town-hall of such city or town; and shall renew the same if defaced, and shall return a copy thereof, to the receiver of corn returns.

BUSHING. See COAKING.

BUSHMILLS, in Geography, a small town of the county of Antrim, and province of Ulter, in Ireland, where there is a bridge over the river Bush. In the bed of the river, near the bridge, are ranges of basaltic columns, similar to those of the Giant's-caulfeay; and also on the summit of an adjoining mountain. In the neighbourhood is the ruin of the castle of Dunluce, which is situated in a singular manner on an isolated abrupt rock, perforated by the waves; which has formed under it a very spacious cavern. The only approach to this castle is along a narrow wall, built somewhat like a bridge; which circumstance must have rendered it almost impregnable before the invention of artillery. Bushmills is 20 miles north of Dublin, and about 6 miles east of Coleraine. Hamilton's Antrim.

BUSHWICK, a small but pleasant town of America, in King's county, Long Island, New York. The inhabitants, 540 in number, are chiefly of Dutch extraction; and of these 99 are electors.

BUSHY RUN, a north-east branch of Swickley creek, near the head of which is General Boquet's field. The creek runs south-easterly into Youghiggy river, 20 miles S. E. from Pittsburg, in Pennsylvania.

BUSIR, or BUSIRS, an anciently Busiris, the name of four different towns or villages of Egypt, viz. one on the west side of the Nile, at a small distance from the pyramids, and 18 miles S. W. of Cairo. N. lat. 29° 56'. E. long. 31° 6'.—Alfo, another on the west side of the Nile, 7 miles N. W. of Achmounain or Hethamunene. N. lat. 28° 15'. E. long. 30° 44'. See BUSIRS.—A third near the western banks of the Nile, 12 miles S. W. of Athish.—A fourth in the Delta, on the western side of the salt branch of the Nile about 5 miles S. of Semmned, mentioned by Herodotus (I. ii. c. 530). See BUSIRS.

BUSIRS, in Entomology, a species of Papilio, (Hesp. Urb.) with oblong entire wings of a black colour; on the anterior pair two yellow spots and dots; posterior ones with a yellow disk. This is a native of India. Donov. Inf. Ind.

BUSIRS, in Ancient Geography, a city of Lower Egypt, now Busiri, on the Burtirific branch of the Nile, and capital of the Burtirific name in the Delta; said to have been built by Burtiris, a cruel tyrant, who was slain by Hercules; but Strabo (Geog. vol. n. p. 115) denies the existence of such a person. Busiris had a large temple erected to her in this city, some ruins of which are said to be still remaining. The Burtiris of the Thebais, the second Burtiris mentioned in the preceding article (Busiri), having revolted from the Romans, was destroyed by Diodorean in his expedition against Egypt, A. D. 296.

BUSIRS, in History, the name of several kings, who, according to Diodorus Siculus (I. i. c. 17) reigned in Egypt, one of whom is said to have built the magnificent and powerful city to which the Greeks gave the name of Thebes. He acknowledges, however, that the barbarity of a certain Burtiris was fabulous; and that the fable was grounded on a custom practised in Egypt, of sacrificing all the red-haired people they met with, most of whom were strangers, as the natives of the country were scarcely ever of this colour, to the names of Ophiris: Burtiris signifying, in the Egyptian tongue, the fepulchre of Ophiris. Virgil ranks the barbarity of this tyrant among the fictions of the poets. Virgil, however, has been cenured for applying the epithet "illaudatus" to Burtiris (Georg. I. iii. v. 3); as it does not sufficiently express the terror which the cruelty of such a monarch tended to excite. Aulus Gellius (I. i. c. 6) has endeavoured to vindicate Virgil's use of this term, as implying a tacit condemnation and detestation of the character of Burtiris, because a person who, in all things, and at all times, remains unpraised, "illaudatus," must be the word and the most wicked of wretches; and if "illaudare" be considered as signifying, in old Latin, to name, "illaudatus" being the same as "illaudabilis," implies, in Virgil's use of it, that Burtiris did not deserve to have his name repeated. Bayle, diffatisfied with these apologies for the Roman poet, suggests that this verse is one of those in which poets are forced, upon account of the length or shortness of syllables (the different feet) to employ unlees words, more expressive, or even such as prejudice the sense. Although Istocrates made a panegyric on the tyrant Burtiris, Bayle suggests that he only intended to confine the impertinent panegyric of Polybius, a teacher of oratory in the island of Cyprus, who had written the eulogium of Burtiris, and the acculation of Socrates. Melanchthon, from his researches (in Chron. lib. ii.) concludes that Burtiris was probably the Pharaoh who occasioned the destruction of the children of the Israelites. Orfeus places him 775 years before the foundation of Rome; and, according to Ezechius, he was contemporary with Joachs, about 700 years before Romulus built Rome. Gen. Dict.

BUSITTIS, in Geography, a district of Arabia Deferta, said to have derived its name from Bus or Buz, Nahor's second son, and to have been the country of Eliah, the fourth interlocutor in the history of Job; called by the LXX. Buzites.

BUSK, a town of the duky of Courland; 18 miles S. S. W. of Mitaw.

BUSKIN, Cothurnus, an article of dress, somewhat in the manner of a boot, covering the foot and mid-leg, and tied beneath the knee: very rich and fine, and used principally on the stage by the actors in tragedy.
The buffalo is said to have been first introduced by Ezechiel; it was of a quadrangular form, and might be worn indifferently on either leg. Its hide was made to thicken, as, by means of it, men of ordinary stature might be raised to the pitch and elevation of the heroes they personified; in which it was disfigured from the foot, worn in comedy; which was a low, popular shoe. By aid of this appendage, the stature of the tragic actors was frequently increased to four cubits, or about six English feet and half an inch, the height of Hercules and the most ancient heroes. The buffalos raised them four or five inches; while guntlets lengthened their arms; and their broad, flat, and every part of the body, were rendered apparently thicker in proportion.

Doppler observes, that the buffalo was not confined to actors only, but girls likewise used it to raise their height; and travellers and hunters to defend themselves from the aire, &c.

As the buffalo was the disfiguring mark of tragedy on the stage, we find in classic authors frequently used to signify "tragedy itself," and to express strong and vehement declamation or lofty title, which was usually affected by these actors of colossal figure.

BUSKY, in Geography. See Buck.

BUSLEIDEN, John, in Biography, a native of Arlon, in Luxembourg, became master of the requels in the court of Charles V. and counsellor to the sovereign council of Mechlin. He was also employed in embassies to pope Julius II. and the kings Francis I. and Henry VIII. As a man of literature he was disfigured, and he was an intimate friend of several learned men, particularly of Erasmus and Sir Thomas More. He founded, in the University of Louvain, the college of the three tongues, for teaching Latin, Greek, and Hebrew. On his journey to Spain, in 1517, he fell sick, and died at Bourdeaux. The only piece of his writing is a letter prefixed to More's Utopia. Gen. Dict.

BUSODRA, in Geography, a town of Asiatic Turkey, in the Arabian Iraq; 96 miles N.W. of Bafitra.

BUSS, in Navigation, a small ship, used by the English and Dutch in the herring-fishery, which fee.

The word is originally Flemish, but, or boys, which signifies the same.

The ship has three short masts, each in one piece. On each is carried a square-sail, and sometimes a top-sail above the main-sail. In fine weather are added a foot of fludding to the lower sails, and a driver. Occasionally is also added a jib forward, upon a small bowsprit or spar. To hoist their nets, the seamen lower the main and fore-masts, which fold on deck by large hinges, and flow aft upon crotchets. The busses is commonly from forty to seventy tons burthen. It has two apartments, one forward, and the other aft; the former of which is used as a kitchen. Every bus has a master, an officer, a mate, and seamen in proportion to the size of the vessel. The master commands in chief, and without his express orders the nets can neither be cast, nor taken up; the officer has the command after him; and the master is next in order, whose business is to see the seamen manage their rigging in a proper manner; to attend to those who draw in their nets, and those who kill, gut, and cure the herrings, as they are taken out of the fen. The seamen generally engage by the voyage; and their provisions consist commonly of biscuit, oat-meal, and dried or salt and fresh fish.

Buss, Buffa, is also the name of a large fort of vellel of war, in use in the middle age, spoken of by antiquaries and historians under the several denominations of buffa, buffa, burcia, buza, buca, and bueca.

BUSSCHOFF, Herman, in Biography, a Dutch physician, was born at Utrecht, in the beginning of the 15th century, and resided many years at Batavias, in the East Indies; and while in that country, he says, to make use of an Indian doctress, to cure him of the gout, by burning little conical pellets of moxa (the pith of a species of artemisia) on the parts affected; a mode of treatment in that and various other complaints, in great repute in China and Japan. The operation fails, he says, about half an hour, and is attended with very little pain. It leaves small scars on the parts, which in a few days are digested out, and the small ulcers that remain heal under any common applications. As soon as the operation was over, he fell into a profound sleep, which lasted twenty-four hours. On waking he was entirely free from the pain of the gout, and the swelling and tenderness of the parts which remained disfigured in a few days. A second attack of the gout, which occurred some years after, was cured in the same manner. He had known, he says, febrile tumours, nodes, and lethargies relieved by the same application. Having collected accounts of a sufficient number of cures effected in this way, he wrote a small treatise on the subject, in the Dutch language, and sent the manuscript to Holland to be printed. He also sent a parcel of the moxa, and of matches made of huckle-wood, which the Indians use to light the pellets with. The book was printed in 1675, at which time Sir William Temple was ambassador at the Hague, and on his being attacked with the gout (it was his first), he was easily induced to try the remedy, which procured him the promised relief. The following year he published an essay on the cure of the gout by moxa, with an account of the method of using it, and the benefit he had received from it. The same year Busschhoff's book was translated into English, on the recommendation, Sir William says, of the professors of Greemah College, but no notice is taken of them in the title or preface to the translation. It was published in 12mo, with chirurgical observations by Henry Van Rooyenhuyzen. The remedy became for a time extremely popular here; but, not being found to answer the expectations that had been raised, it is long fallen into disuse. It is probable, however, that in recent cafes, and in constitutions not broken by in temperament, some benefit might accrue from the application. Haller. Bib. Med. The Author's Preface, &c.

BUSSET, in Geography, a town of France, in the department of the Ailler, and district of La Paille; 5 miles S. E. of Caffel.

BUSSETTO, a town of Italy, and capital of a small district in the duchy of Placenza; 8 miles S. E. of Cremona.

BUSSI, Bussi, or Bosissi, an island of Africa, in the Atlantic, near the island of Biafo.

BUSSIÈRE-BALDI, a town of France, in the department of the Dordogne, and chief place of a canton in the district of Nontron; 8 miles N. of it. The place contains 1,230, and the canton 7,049 inhabitants: the territory includes 150 kilometres, and 9 communes.

BUSSIÈRE-CALAND, a town of France, in the department of the Upper Vienne, and district of Limoges; 5 leagues S. W. of it.

BUSSIÈRE-Poitevine, a town of France, in the department of the Upper Vienne, and district of Bellac; 10 miles N. W. of it.

BUSSIÈRES, John de, in Biography, a distinguished writer of France, was born in 1607, at Ville-Franche, in Beaulojolais, and entered among the Jesuits. His poems, written in French, are forgotten; but his Latin poems, first printed at Lyons, in 1658, 12mo, are still read. Of thefe the principal is "Scanderbeg," an heroic poem in 8 books; besides which there are four Delivered, Some Idylls and Elegies. Bussieres likewise wrote a "History of France," 6 vols.

2 vols.
BUS

2 vals. 4to.; and an abridgment of universal history, entitled "Heloquius Historiarum." He died in 1678.

BUSIETE, in Geography, a town of France, in the department of the Upper Marne, and district of Langres; 4 leagues S.E. of Langres.

BUSIEURES, by corruption from Busfora in Persia, whence they were originally brought, a name given by some to that species of pigeon called the carrier.

USOVAZ, in Geography, a town of Bosnia; 20 miles S. of Serosio.

Bussy le Grand, a town of France, in the department of the Côte d'Or, and district of Samur, three leagues N.E. of it.

BUST, in Geography. See Bosq.

Bust, or Busts, in Sculpture, that portion of the human figure which comprises the head, neck, breast, and shoulders; the Italians also apply this term to the human figure as low as the hips, with or without the head and arms. This definition of the bust agrees with that species of sculpture which represents the portraits of illustrious Romans, either entirely round and mounted on pedestals, or in alto relievo on the sides of sarcophagi, or other sepulchral monuments, and was most likely of Roman production; very different from the Erma of the Greeks, which we call Terms: the Erina was a four square prop with the head of some divinity or man upon it.

The etymology of the Italian busto is perhaps from the Latin, bullum; Fellus says "the place is properly called bullum, in which the dead is burnt and buried, (qua bene ufilum) as it well burnt; where it is only burnt, but buried in another place, the first is said to be ufluma, (ub uenire) burning; but bullum, the place of burial, which we call the sepulchre:" as many of these busts have been principal ornaments of the sepulchre, they may have derived their name from the situation, or, on account of their confinement in it, have had its name transferred to them. The series of Roman emperors in the capitol, and the fine bronze busts in the king of Naples's collection at Portici, exhibit examples of every species in this kind of sculpture. Bernini and other artists among the moderns, have likewise left examples of the several varieties.

Busts, Communicative, in Aesoplices, are two heads of plaster of Paris, placed on pedestals on the opposite sides of a room, and connected with each other by means of a tin tube about an inch in diameter, passing from the ear of one head, through the pedestal under the floor, and ascending to the mouth of the other. The end of the tube which adjoins the ear of the one head, should be considerably larger than the end which proceeds from the mouth of the other. The whole apparatus should be so contrived, that there may not be the least filpulsion of any communication. If a person speak with a low voice into the ear of one bust, the sound will be reverberated through the length of the tube, and will be distinctly heard by every one who shall place his ear to the mouth of the other. By means of two tubes, one passing to the ear and the other to the mouth of each head, two persons may converse together, by applying their mouth and ear reciprocally to the mouth and ear of the bust; and at the same time, other persons that stand in the middle of the chamber, between the heads, will not hear any part of the conversation. If a bust be placed on a pedestal in the corner of a room, and two tubes, such as those above mentioned, be so disposed, that one may pass from the mouth, and the other from the ear of the busts through the pedestal and the floor, to an under apartment, we shall obtain what is called the "Oracular head." There may be likewise wires that pass from the under jaw and the eyes of the bust, by which they may be easily moved. A person placed in the under room, who, at a given signal applies his ear to one of the tubes, will hear any question that is asked; and may immediately reply, favouring the deception by moving at the same time the mouth and the eyes of the bust, by means of the wires. Hooper's Rational Recreations, vol. ii. p. 203, &c.

BUSTA Gallia, a place in ancient Rome, wherein the bones of the Gauls, who first took the city, and were slain by Camillus, were deposited. It differed from

Busta Gallosum, a place on the Appennines, thus called by reason of many thousands of Gauls said there by Fabius.

BUSTARD, in Geography, a river of Upper Canada which runs into the river St. Lawrence, westward of Bleek river, in a bay of its own name. It communicates within land, with several lakes in its extended course; and at its mouth lies the Olerus islands. N. lat. 49° 20'; W. long. 68° 5'.

Bustard is also a bay on the east coast of New Holland, with a good anchorage in five fathoms. S. lat. 24° 4'; E. long. 151° 42'.

Bustard, in Ornithology. See Otis.

BUSTA, in Geography, a town of European Turkey, in the province of Albania; 52 miles W. S. W. of Delfine.

Busto Granda, a town of Italy, in the duchy of Milan; 16 miles N.W. of Milan.

BUSTURAIIE mecha, a kind of public profiteers, who frequented the bulia or tombs, which it seems were ordinarily places of rendezvous for persons of this description. Others suppose that these were women hired to attend a funeral, and lament the loss of the deceased.

BUSTURI, a kind of gladiators, among the ancient Romans, who fought about the bulia, or pile, of a deceased person, in the ceremony of his obsequies.

The practice at first was, to sacrifice captives on the tomb, or at the bulia, of their warriors: instances of which we have in Homer, at the obsequies of Patroclus, and among the Greek tragedians. Their blood was supped to appease the infernal gods; and render them propitious to the names of the deceased. In after-ages, this custom appeared too barbarous; and in lieu of these victims, they appointed gladiators to fight; whose blood, it was supped, might have the same effect.—According to Valerius Maximus and Florus, Marcus and Decius, sons of Brutus, were the first, at Rome, who honoured the funeral of their father with this kind of spectacle, in the year of Rome 480.—Some say, the Romans borrowed this custom from the Hetrurians; and they from the Greeks.

Bustum, in Antiquity, denotes a pyramid or pile of wood, whereon were annually placed the bodies of the deceased, in order to be burnt. The Romans borrowed the custom of burning their dead from the Greeks. The deceased, crowned with flowers, and drest in his rich bos habits, was laid on the bulia. See Burning. Some authors say, it was only called bulia, after the burning, quas bene uflum; before the burning it was more properly called pyra; during it, rogus; and afterwards bulia. When the body was only burnt there, and buried elsewhere, the place was not properly called bulia, but ufluna, or uflurium.

Bustum, in the Campus Martius, was a structure whereon the emperor Augustus first, and, after him, the bodies of his successors were burnt. It was built of white stone, surrounded with an iron palisade, and planted within face with alder trees.

Bustum was also figuratively applied to denote any tomb. Whence these phrases, facere bulium, violare bulium, &c.
But of an altar, was the heath or place where the fire was kindled.

BUSLGINO, in Geography, a settlement of Siberia, on the Indigida: 283 miles N. N. E. of Laibichevick.

BUSULUTZ, a district of Ruffia, in the province of Oemmarah and government of Ufa, seated on the Sacramento, near the river Bubulis: 174 miles S. W. of Ufa.

BUSZKA, a town of Poland, in the paleatitude of Bracian: 32 miles S. W. of Breslau.

Butcher, a person who slaughters cattle for the use of the table, or for sale. The method of slaughtering cattle by a separation of the spinal marrow, is now fully practised in many parts of this world, and is much commented on the ground of humanity, as well as of expedient. Lord Somerville in his work "On the System of the Board of Agriculture," informs us, that with a view to the introduction of it into this kingdom, he made it his business, during his residence in Portugal, to have a person instructed in the use of the knife which is used for this purpose with great adroitness. He has given a plate exhibiting the mode of operation, as well as the size and form of the knife with which it is performed. The animal, in this mode of slaughtering, is unmercened from head to foot at the first touch of the spinal marrow: and the term of "laying down cattle," which expresses the operation, be speaks the mildness with which it is executed. The person employed in this business has "laid" without being head-lincd, 15 oxen in a row, with surprising regularity and expedition, and their fall is almost instantaneous. Holding them only by the horn in the left hand, and banding in front of the animal, he passes the knife over its brow, through the vertebræ of the neck, into the spine. The method in that country of the cattler walking at the head of his oxen, when at work, may probably induce them to stand more quietly than would otherwise be the case. Should that be the fact, cattle in this country may be head-lincd as usual, and the operation would then be as safe as it is easy.

Among the ancient Romans there were three kinds of established butchers; viz. two colleges, or companies, composed each of a certain number of citizens, whose office was to furnish the city with the necessary cattle, and to take care of preparing and vending their flesh. One of these communities was at first confined to the providing of hogs, whence they were called fauri; and the other were charged with cattle, especially oxen; whence they were called pecuari, or boariti. Under each of these was a subordinate chief, whose office was to kill, prepare, &c. called lati, and sometimes carnifices. Drifonius, Modius, and others, mention a pleasant way of selling meat, used for fome ages among this people: the buyer was to shut his eyes, and the seller to hold up some of his fingers; if the buyer guessed right, how many it was the other held up, he was to fix the price; if he miskook, the seller was to fix it. This custom was abolished by Apponius, prefect of Rome; who in lieu thereof introduced the method of selling by weight.

The Jews have their own butchers; as they have a peculiar method of selling and preparing their meat. The exercise of this office has been confidered among them as singularly important, and requiring previous instruction, for which, application has been sometimes made to a learned rabbi, and for which, a formal licence has been thought necessary.

Some derive the term butcher from bucarius, of buca, mouth; others from gobus, feller of cattle.

The French call a place set apart either for the slaughter of cattle, or expending their flesh to sale, a butchery. Butcherie. The English distinguish, calling the latter a fleshy store, or market, the former a slaughter-house.—Nero built a noble edifice of this kind at Rome: on which occasion was struck that medal, whose reverse is a building supported by columns, and entered by a person of four steps; the legend, MAC. AVG. S. C. Mixtum Agripi Senatus Consulto.

In London, the furnishing of the markets with butcher's meat is cantoned into several offices. We have carcase butchers, who kill the meat in great quantities, and sell it out to another sort called retail butchers, dispersed in all outports, villages, and towns, near the city. There are besides, cow-jobbers, or fakemen, who buy and sell cattle, acting between the butchers and the breaders, or feeders. Something like this also obtains at Paris.

The company of butchers was not incorporated until the third year of King James I., when they were made a corporation by the name of master, wardens, and commonality of the art and mystery of butchers: yet the fraternity is ancient. Their arms are azure, two axes faltier-wise argent, between three hors' heads couped, attired or, a horse's head gules, between two garbes vert. See Company.

There are some good laws made for the better regulation of butchers, and for preventing the abuses committed by them. By Stat. 2 and 3 Edw, VI. 15, revived, continued, and confirmed by Stat. 22 and 23 Car. II. c. 19, now expired, butchers (and others) concurring to sell their victuals at certain prices are liable to 12s. penalty, or 20 days' imprisonment, with merely bread and water, for the first offence; 20l. or the pillory, for the second offence; and 40l. or pillory, and the loss of an ear, and infamy, for the third offence: the offence to be tried by the lieutenants or less. By Stat. 4 Hen. VIII. c. 3, no butcher shall flay any beast within any walled town, except Berwick and Carlisle, on pain of forfeiting for every ox 12d., for every cow or other beast 8d. By the ordinance for bakers, butchers, &c. butcher selling swine's flesh meagled, or dead of the murrain, or that buy flesh of Jews, and sell the same to Christians, for the first time, shall be grievously amercid, the second time suffer the pillory, the third time be imprisoned and fined, and the fourth time forswear the town.

By Stat. 3 C. I. c. 1. butchers are not to kill or sell meat on Sundays, on the penalty of forfeiting 6s. 8d., one third to the informer, and two thirds to the poor. By 1 Jac. I. c. 22, and 9 Ann. c. 11, regulations are made as to the watering and grazing of hides, and penalties annexed to the violation of them; and also to the selling of mufled or rotten hides, and also by the said Stat. 1 Jac. I. no butcher shall be a tanner or currier. See Cattle, Foresetting, and Victuals.

Butcher-bird, in Ornithology. See Lanius.

Butcher's broom, in Botany. See Ruscus aculeatus.

Butcher's Island, in Geography, a small island of the East Indies, about two miles long and one broad, distant about three miles from Bombay, and deriving its name from the cattle that are kept there for the use of that settlement. It has a small fort.

Butte, an island in the Frith of Clyde, situated a little to the west of Renfrewshire, and a little south of Argyllshire. The name at different periods has been variously written, as Betis, Bobs, Botes, and Botes, and is denominated Bates by the anonymous geographer of Ravenna. This island was from "very early times part of the patrimony of the Stuarts; large portions of it were granted to Sir John Stuart, son of Robert II., by his beloved mistress Elizabeth More; and it has continued in the same family to the prentent time." Butte life occupies an area of ground measuring on an average about 18 miles in length, by 4 in breadth, and containing about 20,000 acres, and 4000 inhabitants. The northern
northern parts of it are rocky and barren, but its southern parts are molly inclosed, well cultivated, and fertile. The isle is divided into two parishes, in one of which is the royal burg of Rathaephy, which is the principal town of the island and of the isle. The coast is rocky, and indented with several small harbours, from which are annually fitted out a number of busses for the herring-fishery. This is the principal trade of the isle, and has been promoted even at the expense of agriculture. The climate, as usual in small islands, is necessarily damp. Its produce is barley, oats, and potatoes; turnips with artificial grusses have been late cultivated. Indeed, from the example and recommendation of the marquis of Bute, who is the principal proprietor of the isle, and derives his title from it, the system of agriculture pursued here is far before most of the northern counties, and such as is calculated to obtain the greatest produce from the lands. The name nobleman has also directed the fishermen and farmers to be diligent, and each to attend to his respective pursuit. The farms are molly small, as few exceed the rent of sixty pounds a year, but the medium is about twenty-five. Arable land was let, when Mr. Pannant visited the isle, at nine or ten shillings an acre, and the price of labourers was eight pence a day. Rents were molly paid in money, and the rent-roll of the isle was about 400l. a year. The government of Bute is managed by a deputy-thief, who is always resident, and determines most petty actions; but criminal actions are carried to Inverary, where the judges of the court of judicature meet twice a year. The marquis of Bute is admiral of the county, by commission from his majesty, and not at all dependent on the lord high admiral of Scotland.

He has, therefore, full powers, either in himself, or by deputy, to judge and decide on all crimes of murder, piracy, &c. Among the remains of antiquity is part of a Druidical circle at Langal chord. At Kin-garth are the ruins of a church, of which two cemeteries remain. One of these was exclusively appropriated to the interment of females, because, observes Mr. Pannant, 1 in old times certain women being employed to carry a quantity of holy earth, brought from Rome, lost some by the way, and so incurred this penalty for their negligence, that of being buried separate from the other sex.”

Near this place is a circular enclosure called the Devil’s Cauldron; it is made of stones piled together without mortar, but trimmed in the inside in a smooth and regular manner. The walls are about seven feet in height, and ten feet in thickness. The area is thirty feet in diameter, and the entrance gradually narrows, from the outside of the wall towards. Near Rothsay are the remains of an ancient cist, with a fort, barracks, and drawbridge, which was formerly the residence of the kings of Scotland. See Rothesay.

Bute, a county or shire of Scotland, comprehending the above isle, with those of Arran, the two Cumbrays, and Inchmarnock. This county, with that of Caithness, combine to fend one member to parliament alternately. See Pannant’s Tour in Scotland, vol. ii. Sinclari’s Statistical Account of Scotland.

Species, i. B. frondosa. Roxb. Corom. i. tab. 21. (Palafox, Rox. Rheede. Mall. 6. tab. 16, 17. Arbor filipoo ta hishica indica, Ray Hift. 1721. Erythrina monosperma, La Marek Eucec. tom. ii. p. 391.) “Little branches pubescent; leaflets roundish, emarginate.” Willd. An evergreen tree. Stem about fifteen feet high; outer bark, cimeneous, dark, brittle, clothed with a dark red cuticle; inner bark soft, but thick, from which, when cut, exudes a juicy blood-red juice, of a sweetish taste. Leaves alternate, petiolated, growing by threes, about ten inches long; leaflets about four inches long, even above, transversely knife-shaped, reticulated between the nerves; the terminal leaflet at right angles with the other two, wedge-shaped at its base; the lateral leaves larger on the exterior side than on the interior, with short and thick petioles. Flowers red, rather large, in racemes, on alternate, or scattered, somewhat tomentose, peduncles. Calyx short, five-toothed. Wings of the corolla a little shorter than the standard; keel shorter than the wings. Legumes elliptic-oblong, pubescent, from four to five inches long, and near two inches broad. Ray from Rheede, and La Marek from a dried specimen, communicated by Juffieu. A native of the East Indies, on the coasts of Malabar and Coromandel.

Obf. Juffieu informed La Marek that from this tree is procured the gum lac of commerce; and in fact there are found here and there, on the branches of most of the species, in his Herbarium, redumous lumps which greatly resemble that substance. These lumps are much divided, and not in cuticle masses, like those of gum or resin which proceed from various trees; so they do not appear to be the infusificated juice mentioned by Rheede, but, agreeably to the common opinion with respect to gum lac, may be elaborated by a species of ants, somewhat in the same manner as bees form their wax, and discharged on the same tree from which the crude juice was obtained.

2. B. superba. Roxb. Corom. i. tab. 22. “Little branches smooth; leaflets attenuated at the base, roundish, obtuse.” Willd. Very similar to the preceding, but differs in the particulars mentioned in the specific character, and in having leaves three times as large, the leaflets being a foot long. A native of the coast of Coromandel.

Dr. Roxburgh has described these two species in the third volume of the Asiatic Researches, p. 469, 8vo. The frist is the Maduga of the Gentoos. The juice above-mentioned hardens into a ruby-coloured brittle astringent gum, soon losing its beautiful colour when exposed to the air; entirely soluble in water, and also in a great measure in spirits. Infusions of the flowers dye cotton cloth, previously impregnated with a solution of alum, or alum and tartar, of a molot beautiful bright yellow. The second species is the Tida maduga of the Gentoos. This also yields a red gum from its bark, and its flowers afford the same beautiful yellow dye and pigment.

BUTEO, in Ornithology, the species of Falco we call the common buzzard in this country. It has the cere and legs yellow; the body brown, and the belly pale, with brown spots. This is rather larger than a kite in the body; its length about 20 inches.

BUTEONIS, in Zoology, a species of Echinorhyn- chus, of a very clear white colour, with the velu s of the tail bluish and lentiform. Goeze. Length of this kind two inches and a quarter. Infests the intestines of the buzzard.

Butenonis, a species of Ascaris, that infects the intestines of the buzzard, Falco buteo, but of which no particular description has been hitherto given. Goeze, Gen. el. &c.

Buteonis, is also a species of Cucullanus, found in the intestines of the same bird, of which we have no description.
BUTIOTUM, Butrinto, in Ancient Geography, a
village town of Epirus, mentioned by Virgil, Strabo, and
Pliny, who represent it as a Roman colony. It was
placed on a river, called Xanthus, in Thessalia, over against
Corfu, as Butrinto is at present opposite to Corfu. Cæsar
gives it this position; and Virgil says that Æneas landed
there, and was allowed to find a Trojan who reigned here,
and who was Hicetas the son of Priam. This king liber-}
ately supplied the wants of Æneas, and gave him useful
advice with respect to his navigation.

BUTIOTUS, a river of Italy, in the country of the
Pompei. Clauser.

BUTIUS, a town of Africa in Libya Interior, and
near the source of the river Bagrada. Toqiny.

BUTYLIUS. See T. in Antiquity, a sacrifice of the
greatest kind: such were the hecatoems. See Sacrifice
and Hecatombs.

The Greeks frequently prefixed the particle ἐν, ὑπό, to
words, to denote things of extraordinary magnitude, as
alluding to the bigness of oxen.

BUTI, in Geography, a town of Italy, in the duchy of
Tuscany, seated on the Arno; 20 miles N.N.E. of Leghorn.
The mountains of Pisa form near this place a deep narrow
hollow, called the valley of Buti, bounded by the sides of
the mountains, which are covered with pine, cedrus, and
olive trees. In the bottom is a smooth ground, cut by an
impetuous torrent; and in the lowest part of it is situated
the land of Buti, in two divisions, the higher, called the
"castle," and the lower, the "town." It is continually
exposed to a cold, moist air, except during some days in
summer; it is often covered with a thick cloud, and subject
to sudden changes of weather, particularly to heavy rains;
owing to its being below the high mountains of Pisa, and
to the lake of Bicentia, which feeds.

BUTIGA, is an inflammation of the whole face, otherwise
called guta rojacea.

BUTIS, in Ancient Geography and Mythology. See
Butus.

BUTLASS, in Geography. See PuDAR.

BUTLER, or Bottle, an officer whose chief charge is
over the cellars and liquors. See Arch-Butler.

Butlers, buticularis, among the Normans, denoted wine-
tellers, appointed to examine liquors, and fees that they were
right and legal.

Butler of France, buticarius Francia, was one of the
great officers of the household of the ancient kings of
that country, who signed all the royal patents, or at least
was present at the dispatch of them. His seat was among
the princes, and he even disputed the precedence of the con-
stable of France. He had a right of prefalting at the
chamber of accounts; and in the registers of that office of the
year 1357, mention is made that John de Bourbon, grand
butler of France, was admitted there as first president.
But the title has been since abolished, and, in lieu thereof,
a new office of grand chevalier, or cup bearer, was erected.

Butler, James, duke of Ormond, in Biography, an
accomplished English courtier and eminent statesman, in
the 17th century, was the son of Thomas Butler esq. a branch
of the Ormond family, and by his mother, the granddau-
†on of Sir John Poynitz, and born at Newcastle-house in Clerken-
well, London, in 1610. Upon the decease of Thomas, earl
of Ormond, his grandfather, Sir Walter Butler of Kilkea,
affirmed the title, and his father was called by courtesy
viceroy of Thurlus. After the death of his father, who was
drowned on his passage from Ireland to England, in 1619,
and who left a widow and 7 children in embarrassed circum-
stances, this title devolved upon him. In 1620, he was sent
over to England by his mother, and placed under the tuition
of a parish schoolmaster at Finchley, near Barnet; but by
the intercession of King James, who claimed the wardship
of the young lord, he was removed to Lambeth, and his
education was committed to the superintendence of arch-
bishop Abbot. In this situation he is said to have enjoyed
little advantage with regard to general instruction; but he
acquired those principles of the Protestant religion to which
he maintained a steady attachment in the progress of his life.
Upon the death of King James, he was taken home by his
grandfather, the earl of Ormond, and no further care seems
to have been taken with regard to his education. At the
age of 18, he attended the duke of Buckingham at Port-
mouth, and after the assassination of this favourite by Felton,
he returned to London; and marrying his cousin, the lady
Elizabeth Preston, in 1639, he brought to an amicable ter-
mination the disputes that had long disturbed the harmony
and injured the interests of both families. In the following
year he removed to Ireland, and purchased a troop of horse.
In 1632 his grandfather died, so that he succeeded to the
title and estates of the earldom of Ormond; and in 1633,
when lord Wentworth, afterwards earl of Strafford, became
governor of Ireland, he was distinguished by the peculiar
attention of this eminent statesman; who, on occasion of
their first interview, said, "that if his skill in phyllogny
om did not fail him, that young noblemen would make
the greatest man of his family." The connection thus
formed between the lord-deputy and the young earl, sub-
sidized, with little interruption, during the whole of Strafford's
administration. At the age of 24 he was sworn of the privy
council, and on occasion of the troubles which broke out in
Scotland, he was appointed to the command of the army
levied in Ireland, under the lord lieutenant. To the inter-
est of lord Strafford he uniformly adhered; and this unfortu-
nate nobleman testified the sense he entertained of the importance
of his services, by requesting that the king would confer his
blue garter upon his friend the earl of Ormond; which,
however, he declined accepting during this reign. Upon
the commencement of the great rebellion in Ireland in 1641,
the earl of Ormond was appointed lieutenant-general and
commander in chief of the army, which consisted at that
time of no more than 3000 men. Without this considerable
force, and a few additional troops which he was able to raise,
he refit the progres of the rebels, and in 1642 demolished
them from the Naas near Dublin, raised the blockade of
Drogheda, and routed them at Kilrath. His exertions,
however, were impeded by the jealousies of the lords justices,
and afterwards of the earl of Lecicet, the lord lieutenant;
but the king, with a view of counteracting this opposition,
gave him an independent commission under the great seal,
and, as a further mark of favour, created him marquis of
Ormond. In 1643 he obtained a considerable victory with
very inferior forces over the rebels under the command of
the Irish general Preston, but for want of suitable encourage-
ment, he was under a necessity of concluding a cessation of host-
tilities, for which measure he was much blamed in England;
though he availed himself of it by sending over troops to the
assistance of the king, who was then at war with the parlia-
ment. His majesty, in recompense of his fidelity, and the
service rendered to the royal cause, created him lord-lieute-
nant of Ireland, in the room of the earl of Lecicet; and he
entered upon his government in the beginning of the year 1644.
In the exercise of this office, he had to contend with many
difficulties, occasioned by the rebellious spirit of the old Irish,
and the machinations of the English parliament. Having
maintained an unsuccessful struggle for three years, he was
at length, viz. in 1647, obliged to sign a treaty with the
parliament's
parliament's commissioners, and to come over to England, where he waited on the king at Hampton-court, and obtained his majesty's full approbation of all his proceedings. His circumstances, however, were embarrassed and perilling, so that he thought it most prudent to provide for his own safety by embarking for France.

During his short residence in this country, he corresponded with the Irish for the purpose of inducing them to engage in the royal cause; and having engaged lord Inchiquin to receive him in Munster, he landed at Cork, after escaping the imminent danger of shipwreck, in 1748. On his arrival, he adopted measures which seemed to revive the hopes of the king's friends. These hopes were further encouraged by the alharrounce excited throughout the country on occasion of the king's death; and in consequence of this favourable impression on the public mind, the lord lieutenant caufed Charles II. to be immediately proclaimed. But Owen O'Neill, intimated to the Pope's nuncio, and supported by the old Irish, raised obstacles in his way, on which he determined to over come by the bold enterprise of attacking the city of Dublin, then held for the Parliament by governor Jones. This entreprise, however, failed, with very considerable losses on the part of the Marquis; and soon after Cromwell arrived in Ireland, and having formed Drogheda, surrendered it to military execution, thus striking terror into the Irish, fo that they became dissatisfied with the lord-lieutenant, and insurfed on his leaving the kingdom. At the close of the year 1652, he embarked for France, and there joined the exiled family. In order to retrieve his own affairs, the marchioness went over to Ireland, and having in some measure succeeded in exempting her own estate from forfeiture, she remained in the country, and never saw her husband till after the restoration. In the mean while the Marquis was employed in various commisfions in behalf of the king; and he rendered essential service to his cause by refusing the duke of Gloucester out of the hands of the queen-mother, and preventing her severe treatment from inducing him to embrace the Catholic religion. He was also instrumental in detaching the Irish catholic regiments from the service of France, one of which he was appointed to command, and in obtaining the surrender of the town of St. Colman, near Brussels, to the Spaniards. In a secret embassy to England for the purpose of investigating the state of the royal party, he cleared several hazards of discovery from the spies of Cromwell; and at length, when Charles II. was restored to the throne of his ancestors, the Marquis accompanied him, and was liberally recompenced for his faithful attachment and active services. Besides the restoration and augmentation of his large estates in the county of Tipperary, he was raised to the dignity of duke of Ormond, and he officiated as lord high-lieutenant of England at the king's coronation. After his appointment to the lord-lieutenancy, in 1662, he made several efforts, attended with considerable success, for reducing the country to a state of tranquillity, and he promoted various improvements, particularly with respect to the growth of flax and manufacture of linen, which very much conduced to its subsequent prosperity. His attachment to Earl Clarendon, however, involved him in the odium which pursued that great man; and though his conduct, after rigorous scrutiny, furnished no matter of just censure, he was nevertheless deprived of his government by the machinations of the duke of Buckingham, in 1699; but in the same year, he was elected to the office of chancellor of the University of Oxford. In 1679, a desperate design was formed against him by colonel Blood, whom he had imprisoned in Ireland on account of his having engaged in a plot for the surprisal of Dublin castle. Blood, being at this time in London, determined to seize his person, in his return from an entertainment given in the city to the prince of Orange; and in the prosecution of his purpose, his accomplices dragged the duke out of his coach and placed him behind one of them who was on horseback, in order to convey him to Tyburn, and execute him on the public gallows; or, as others say, to take him out of the kingdom, and compel him to sign certain papers relating to a forfeited estate of Blood. The duke by his struggles threw both the man and himself from the horse, and by feasible alibis he was released from the custody of these affasins. This daring act of violence excited the king's resentment; but Blood, for certain reasons, having been taken into favour, his Majesty required the duke to forgive the insult. To which message he replied, "that if the king could forgive Blood for attempting to heal his crown, he might easily forgive him for an attempt on his life; and that he would obey his Majesty's pleasure without inquiring into his reasons." For seven years the duke of Ormond, who was equally adverse to papists and fanatics, and who puffed a spirit which would not stoop to the cabals formed by triflers and perfons delirious of honour, was neither in favour with the court nor employed by it; but at length, in 1677, he was surprized by a message announcing the king's intention to visit him. The object of this visit was to dissolve his Majesty's resolution of appointing him to the lord-lieutenancy of Ireland; and this resolution had been adopted by the influence of the duke of York, who had reason to imagine that the "cabin," or court-party, proposed to introduce the duke of Monmouth into this high station in the room of the earl of Effex, who had been removed. In order to counteract this plan, the duke of York recommended his grace of Ormond to the king, as the most likely person to engage general confidence, and to unite discordant parties in both countries. The king per fided in his resolution, and the duke of Ormond took possession of the government. Upon his arrival, he adopted vigorous measures for diminishing the papists and maintaining public tranquillity; and though he did not escape calamity, the king determined to support him against all attempts for removing him, and declared with an oath, "that while the duke of Ormond lived, he should never be put out of that government." He was devious, indeed, of calling a parliament in Ireland for settling affairs, but to this measure the king would not give his consent. In 1682, when he came over to England to attend the king with the state of his government, he was advanced to the dignity of a English dukedom; but notwithstanding this mark of royal favour, he had given such offence by his impor tunity with respect to an Irish parliament, that immediately on his return he was apprised of an intention to remove him. Upon the accession of James, the duke caused him to be proclaimed, and soon after resigned his office and came over to England. Although the duke's principles did not suit the projects of the new reign, he was trea ted with respect by the king, and received from him the honour of a visit whilst he was confined to his chamber with the gout. He died at Kingston-hall, in Devonshire, July 21st, 1688, in the 75th year of his age, and was buried in Westminster-abbey. "The character of the duke of Ormond was that of a high-spirited and liberal nobleman, upright in his intentions and steady to his political principles, which were those of monarchy with large prerogatives, but not beyond the law. He was a steady friend to the church of England, and had in his family several men of learning who attained to eminence, among whom were Dr. Hough, the excellent
excellent bishop of Worcester, and the very ingenious Dr. Burnet of the Charter house. From a low though honourable beginning, he arrived at great rank and prosperity, and left a numerous progeny, of which he lived to see the third generation. He was active and well versed in business; and his talents, though not of the first class, enabled him to appear with reputation in several difficult conjunctures." Biog. Brit. Gen. Biog.

Butler, Joseph, an eminent prelate of the English church, was born at Wantage in Berkshire, in 1692, and was intended by his father for the ministry among protestant dissenters of the presbyterian denomination. With this view, after having finished his grammatical education at his native place, he was sent to a dissenting academy, kept by Mr. Samuel Jones, first at Gloucester and afterwards at Tewksbury. Of his application and proficiency as a theological student, he exhibited a signal evidence in two letters addressed to Dr. Clarke, and containing a statement of doubts that had occurred to him concerning the conclusiveness of some arguments in the Doctor's "Demonstration of the Being and Attributes of God." The first of these letters, dated Nov. 4, 1713, displayed a sagacity and depth of thought which excited the particular notice of Dr. Clarke. Encouraged by this condescension, Mr. Butler addressed the doctor again upon the same subject; and received an answer. The whole correspondence, which comprised three other letters, was annexed to the celebrated treatise above-mentioned, and retained in all the subsequent editions. The correspondence was secretly conducted by Mr. Secker, the friend and fellow-pupil of Mr. Butler; and procured for him, as soon as he became known, the friendship of Dr. Clarke. Whilst he was engaged in the prosecution of his studies at Tewksbury, he entered into an examination of the principles of nonconformity; and the result of his inquiry was a resolution of conforming to the established church. His father was at first dissatisfied with his purpose, and attempted to divert him from it: but, finding that his son's resolution was fixed, he consented to his removal to Oxford, where he was admitted a commoner of Oriel college in 1714. Here he formed an intimate friendship with Mr. Edward Talbot, second son of bishop Talbot, and to this circumstance he owed all his future preferments in the church. Having taken orders soon after his admission at Oxford, he was recommended, in 1718, by Mr. Talbot and Dr. Clarke to Sir Joseph Jekyll, who appointed him preacher at the Rolls chapel. In this situation he continued till the year 1726, when he published, in one volume octavo, "Fifteen Sermons preached at that Chapel." These sermons established his character as an acute and solid reasoning, and as they are rather deep disquisitions, than popular discourses, adapted solely to a learned and attentive audience, the author thought proper to make an apology for their abstruseness in a preface to a second edition, revised and improved in 1729; in which preface he has also abridged and illustrated the principles laid down in his sermons. The style of these compositions is delusive of that ease and perspicuity, which might justly have been defied, but which Butler was never able fully to attain. His friend Secker is said to have taken pains in rendering more familiar the language both of these discourses and of his other works. By the judicious reader, notwithstanding these defects, they have been always held in high estimation. Under the patronage of Dr. Talbot, then bishop of Durham, to whom Butler was recommended by his son on his death-bed, he was presented, first, viz. in 1722, to the rectory of Houghton near Darlington, and afterward, viz. in 1725, to that of Stanhope in the same diocese. At this latter place, Mr. Butler, having resigned the Rolls chapel in 1726, reigned during seven years, diligently discharging the duties of a good parish priest. The situation, however, was too retired and solitary for a person of his gloomy disposition; and his friend Mr. Secker, who was apprised of this circumstance, was anxious to draw him out of solitude into a more active and conspicuous scene. With this view he took the liberty of mentioning him to queen Caroline; who, apprehending that he was dead, asked archbishop Blackburne, if this was not the fact: to which the archbishop replied, "No, madam, but he is buried." By the recommendation of Mr. Secker, the lord chancellor Talbot nominated him his chaplain; and Mr. Butler accepting the nomination, came up to London by way of Oxford, in 1733, and was created doctor of laws. The chancellor also gave him a prebend in the church of Rochester, and it was stipulated that he should continue to reside half the year at Stanhope. In 1736, he was appointed clerk of the closet to queen Caroline, and in the same year, he published his celebrated work, entitled "The Anatomy of Religion, natural and revealed, to the Constitution and Course of Nature." The first edition of this work, which for depth and originality of thought and reasoning, is one of the most masterly performances that ever appeared in the world, was published in 1736 in 4to; the subsequent editions have been in 8vo, and the last by Dr. Halifax, bishop of Glouceter, was published in 1758. The foundation of the mode of reasoning pursued in this treatise had been laid by the author in his sermons, and particularly in the last of them "On the Ignorance of Man." For a general account of it, see the article ANALOGY. To the "Analogy" are annexed two Diversions; one on Personal Identity, and another on the Nature of Virtue.

Whilst queen Caroline lived, Dr. Butler attended her for two hours every evening; and by her urgent recommendation to the king, he was raised in the year following that of her death, viz. in 1738, to the see of Bristol, and in 1740, to the deanery of St. Paul's in London, upon which he resigned his rich living of Stanhope. Besides attention to the various duties of his diocese and deanery, bishop Butler preached several sermons in the metropolis on particular occasions, which were printed, and which have since been annexed to the later editions of the sermons at the Rolls chapel. In 1746, he succeeded Dr. Egerton, bishop of Hereford, as clerk of the closet to the king; and in 1750, he was translated to the see of Durham. At his primary visitation in 1751, he delivered a charge to his clergy of which the principal subject was "External Religion." In recommending on this occasion the utility of outward forms and institutions, towards fixing and preserving in the minds of men a sense of devotion and duty, he was thought by several prelates to have spoken too favourably of pagan and popish ceremonies, and to have countenanced, in a certain degree, the cause of superstition. He had also put up a plain marble cross in his chapel at Bristol. The charge was animadverted upon by an able and spirited writer in 1752, in a pamphlet entitled, "A Serious Enquiry into the Use and Importance of external Religion, &c." The circunstances of the cross at his chapel, and the offence taken by some persons at this charge, might possibly have given rise to the calumny which was advanced, almost 15 years after his death, in an obscene and anonymous pamphlet, entitled "The Root of Protestant Errors examined;" and which charged him with having died in the communion of the church of Rome. The charge is absurd and groundless, and hardly deserves refutation. It is sufficiently exposed in bishop
bishop Portus’s life of archbishop Seeker; and the character of the worthy prelate has been more amply vindicated by Dr. Halifax, then bishop of Gloucester, in a preface to the second edition of his charge, printed in 1786, containing an account of the character and writings of the author. Soon after his removal to his new bishopric, the health of bishop Butler began visibly to decline; and having made ineffectual trial of the waters at Bristol, he removed to Bath, where he died on the 18th of June, 1752. His remains were interred in the cathedral at Bristol, where a monument, with an inscription, is erected to his memory. For bishop Butler’s intellectual character, it will be sufficient to refer to his invaluable writings. Of his piety we may observe, that it was sincere and fervent, but perhaps inclining too much to the gloomy and ascetic extreme. His benevolence was ardent and diffusive. During his residence on the see of Bristol he expended in the repairs and improvement of the episcopal palace the sum of £2000, which exceeded the whole amount of his receipts from that see. His benefactions were numerous and liberal. He maintained the hospitality and dignity of his diocese with spirit, setting apart three days in the week for the entertainment of the principal gentry of the county, and condescending to invite the poorest of his clergy to his table, and to visit them in their parishes. At his death it is said that he had ordered all his MSS. to be burned, without unfolding the covers of any of them. Biog. Brit. Halifax’s Preface.

Butler, Samuel, a celebrated poet of the 17th century, was born at Strensham, in Worcestershire, as some say, in 1660, and according to others, in 1612. Having laid the foundation of grammar-learning in the free-school at Worcester, he was sent to Cambridge, where he resided, without being matriculated in that University, for 6 or 7 years. Upon his return to his native county, he lived as clerk with an eminent justice of the peace, in whose early and reputable service he had leisure for applying to his favourite studies, history and poetry, and also for amusing himself with music and painting. Under the patronage of Elizabeth, countess of Kent, he had access to a valuable library, and the opportunity of frequent intercourse with the great Mr. Selden, who employed him in writing foreign letters, and translating for him. He also lived for some time with sir Samuel Laker, a gentleman of an eminent family in Bedfordshire, and a famous commander under Oliver Cromwell. About this time he wrote his celebrated burlesque poem, entitled "Hudibras," under which character, as it is generally supposed, he intended to ridicule sir Samuel. After the restoration, Butler was made secretary to Richard earl of Carlbery, lord president of Wales, and by him appointed steward of Ludlow castle, when the court was revived there; about which time he married Mrs. Herbert, a lady of good family and some fortune. The first part of his "Hudibras" was printed in 1665; and it was introduced to the notice of the court by the "Mecenas" of that age, the earl of Dorset; and yet, though it was highly extolled by the prevailing party, both in church and state, and much admired, as well as frequently cited, by the king, the author received no other recompence besides praise and barren promises, and was suffered to pass his days in an obscure and neglected condition. The only boon which was conferred upon him by the king (and even this grant is disputed) was a donation, exempt from office fees, of 300l., which he honourably devoted to the discharge of his debts; but the professions of regard and service made to him by lord chancellor Clarendon, and by the duke of Buckingham, were futile and inefficient. Respected for his integrity and beloved for his social qualities by his few intimate friends, he died in 1680, and was buried in the church-yard of St. Paul’s, Covent-garden, at the expense of his friend Mr. Longueville of the Temple; and, in 1721, a monument was erected to his memory among the poets in Westminster abbey, by alderman Barber, the printer. The inscription figures the common opinion of his poverty by the following words: "Ne cui vivo deceret ferc omnia deflectit etiam mortuo tumulus?" i.e. left he who, when living, wanted almost every thing, should, when dead, want also a tomb.

A monument has since been erected, by private subscription, in the portico of the church, near which he was buried, bearing the poet’s bust, taken from that in Westminster abbey; and on a stone beneath the monument are inscribed the following lines, contributed by Mr. O’Byran:

"A few plain men, to pomp and pride unknown,
O'er a poor hard have raised this humble stone,
Whole wants alone his genius could surmount;
Victim of zeal! the matchless Hudibras!
What! tho’ fair freedom suffered in his page!
Reader! forgive the author—for the age—
How few, alas! disdain to cringe and cang,
When 'tis the mode to play the fycophant!
But oh! let all he taught from Butler’s fate,
Who hope to make their fortune by the great,
That wit and pride are always dangerous things,
And little faith is due to courts and kings."

His poem, entitled "Hudibras" is one of the most original works, with regard both to its style and matter, that was ever written. It is of the burlesque kind, being usually styled a "mock-heroic," or "mock-epic," and much resembles Homer’s "Margites," which, according to Aristo- tole, bore the name relation to comedy, that the Iliad and Odyssey do to tragedy. The hint of it was suggested by the inimitable Don Quixote; and it was intended as a general satire on those times of anarchy and confusion, during which the poet lived, and its leading aim was to expose by ridicule the religious and political principles of the Puritans, as they appeared after the civil war which overthrew church and state in the reign of Charles I. Of this poem there are three parts, which were printed separately; but the story was left unfinished. The diction and verification are often grossly familiar and negligent, though, upon the whole, they add to the humorous effect; and it is justly remarked by Dr. Johnston, in opposition to the judgment of Mr. Dryden, that "the heroic style and measure would not have been better adapted to the author’s purpose. The frequent double rhymes, introduced by the author, although they are often very imperfect, seem to give a kind of comic tone to the whole, and to improve the wit by combining the most incongruous ideas. Butler, besides the talent which he professed of interesting and amusing the reader by odd and whimsical notions and associations, was well acquainted with human life.

To this purpose Dr. Johnston (Lives of the Poets) observes, that "he had watched with great diligence the operations of human nature, and traced the effects of opinion, humour, interell, and passion. From such remarks proceeded that great number of sententious maxims which have passed into conversation, and are added as proverbial axioms to the general flock of practical knowledge." Of the numerous editions of this poem, the most valuable is that of Dr. Zachary Grey, published in 1744, with copious annotations, and a preface in 2 volumes, 8vo. The singular popularity of this poem produced several unsuccessful imitations of it, and some vain attempts to translate parts of it into Latin. But it is not easy, or perhaps possible, to transfer the humorous turn of the phrase, for which this performance is distinguished, into any foreign language. The undertaking, however dif-
ficult, was attempted in a French translation of Hudibras, in 3 vols. 12mo, with notes, by — Townley, junior, etc., of Townley in Lancashire. A collection of pieces, under the title of "The Poetical Works of Mr. Samuel Butler," was published after his death, in 3 vols. 12mo; but most of these are falsely attributed to him, and none of them are of much value. However, in 1759, there appeared a more respectable publication, entitled "Genuine Remains in Prose and Verse of Mr. Butler, from the original MSS. formerly in the possession of W. Lang-stevie, esq."

Butler, William, was born at a town in Derbyshire, in the year 1726. After the usual school education, he went to Edinburgh, and in 1741 took the degree of Doctor in Medicine, and published for his inaugural thesis, "Dissertatio Medica et Chirurgica de Arteriotoria," 8vo. He then returned to Derby, where he practised medicine for about ten years, when he came and settled in London. In 1773, he published a treatise on the kink-cough, the name he gives to the tuffic convulativa, or whooping-cough. In the care he relied principally on the efficacy of the extraictum cicuta, which he considered as a specific in the complaint. Two years after, he gave an account of the puerperal fever, as it appeared in Derbyshire and some of the adjacent counties, 8vo; and in 1794, a treatise on the disease commonly called angina pectoris. This disease was first described by Dr. Heberden. His account of it is published in the second volume of "Medical Transactions," by the Royal College of Physicians. Dr. Butler had no doubt of its being a goofy affection, and calls it the diaphragmatic gout, and thinks it generally curable. In the fit he gives opium with aromatics. For the cure he recommends pills with aloe and loap, to keep the body soluble. These with temperance, he says, will usually succeed in putting an end to the complaint. While he was at Edinburgh, where he appears to have resided about seven years, he published "A Method of Cure for the Stone, chiefly by Injections," 12mo, 1754; and "Dissertatio de Frigore quatenus Morborum Causa," 8vo, 1757. He died at his house in Lower Grosvenor-street, March 21st, 1805. European Mag.
by a charter of Edward I., called "Charta Mercatoria," (31 Edw. I. c. 1 & 2. 27 Edw. III. c. 26) was exchanged into a duty of 3s. for every ton imported by merchant-fraingers, and called butlers. Because it was paid to the king's butler. See Custom.

**BUTMENTS, in Architecture, those supporters or props, on or against which the feet of arches rest.**

Butments of arches are the same with buttresses. They answer to what the Romans call sublices; the French, culées and butées.

The word comes from the French buter, to abut or terminate on any thing; or rather from buter, to prop.

The name butments is also given to little places taken out of the yard, or the ground plot of a house, for buttresses, sculleries, &c.

**Butments, or Butments of a bridge, denote the two masons at the end of a bridge, whereby the two extreme arches are fulfilled and joined with the shore on either side. The butments of bridges next the banks should be built more firm and solid, as serving to fulfill the whole series of arches, and hinder them from spreading. See Bridge.**

**BUTNERIA, in Botany.** See Calycanthus floridus.

**BUTOA,** in Ancient Geography, an island placed by Pliny among those of Crete, between Ophiussa and Arados.

**BUTOUS,** in Botany, (byopous), from βούτος ox, and τίχων to cut; a name given by Theophrastus to an aquatic plant, on account of its being greedily cropped by oxen, or as others think, with less probability, because the sharp edges of its stem wound their tongues and lips. Hefychius defines it, φυτόν βοτον δεδομένον τού ὄχων χρήσει, a plant given to oxen for food like grasses: and Suidas, φυτήρος περιπατοῦς κάλαμον από ὄποιοι, a plant allied to the reed eaten by oxen. Bauline supposes it to be his juncus floridus, the plant before us, to which Linnaeus has since given the ancient name; others, the ipparagium ramoium of Linnaeus; and others, a species of iris.) Linn. gen. 507. Schreber. 693. Wild. 804. Diet. 46. Vent. vol. 2. 158. Clasts and order, camaedia hesperygia. Nat. ord. tripetalaeides, Linn. Junc. 46. Alstromed. Vent.

**BUTONES,** in Ancient Geography, a people placed by Strabo in Germany, and said to be subdued by Maroboduus.

**BUTORICA,** in Botany, Rumph. La Mareck, and Boele. See Bactriae speciosa.

**BUTORICA,** Rumph. See Eugenia acutangula, and racemosa.

**BUTORUS,** in Ornithology, a name by which some have called the common bittern, Ardea Stellatiss.

**BUTOW,** in Geography, a town of Germany, in the circle of Upper Saxony, and farther Pomerania, 39 miles N. E. of New Stettin.

**BUTRINTO,** in Ancient Geography, a sea port town of Albania, in a gulf to which it gives name, in the canal of Corfu, the fee of a Greek bishop, suffragan of Janina. It belongs to the Venetians; 56 miles W. S. W. of Delfino. N. lat. 39° 46'. E. long. 23° 40'.

**BUTRIUM,** or BUTRIO, in Ancient Geography, a town of Italy, in the country of the Cenomani, according to Ptolemy, and placed by M. d'Anville north of Ravenna.

**BUTSKOPF,** (Marten) in Zoology, synonymous with buts-kopper.

**BUTS-KOPPER,** (Egede). See Delphinus orca. BUTT, in Agriculture, a provincial term applied to such ridges or portions of arable land as run out short at the sides or other parts of fields.

**Butt,** in our Ancient Customs, denotes a place erected for archers to shoot at, and in which a mark or white was fixed.

**Butt,** in Commerce, is used for a vessel, or measure of wine, containing two hogsheads, or 126 gallons.—Other-wise called pipe.

A butt of currants is from fifteen to twenty-two hundred weight.

**Butt,** in Ship-building, the end of a plank, or strictly speaking, that end of a plank which was nearest the root of the tree. Each end of a plank is securely bolted to a frame or timber, to prevent its rising from the bottom or side of the ship, which, in that case, would be said to have sprung or started a butt. At sea this is very dangerous, and difficult to get secured if the plank is under water. But also signifies the ground or largest end of all timbers.

**Butts,** or Backs, a denomination given to that part of tanned leather, which is prepared from the rawhide and heavy ox hides, and chiefly used for the soles of shoes. For the process of preparing it, see TANNING.

**BUTTA,** in Ancient Geography, a town of Africa, situated between the two Syrtes, N. of Tege. Ptolemy.

**BUTTELSTETT,** in Geography, a town of Germany, in the circle of Upper Saxony, and principality of Weimar; five miles N. of Weimar.

**BUTTEN,** a town of Arabia, 28 miles E. of Chahir.

**BUTTER,** in Rural Economy, a fat unctuous substance prepared from milk by the processes of churning. It is a matter naturally distributed through the whole substance of the milk in very small particles, which are interposed betwixt the cacaous and serous parts, amongst which it is suspended by a flight adhesion, but without being dissoluted. It is in the same state in which oil is, in emulsions; hence the whites of both; and hence, by heat, the oily parts separate from both those liquors to the surface, and form a cream. When butter is in the state of cream, its proper oily parts are not yet sufficiently concentrated to form an homogeneous mass. While separated by the intervention of a large quantity of serous particles, the butter cannot be completely formed; but by passing out the heterogeneous parts by means of continued percussion, by the well known...
operation of churning, it then becomes an uniform soft mass.

Melis. Parmentier and Deycuex, in a memoir on milk, (Mem. qui a remporté le premier prix, &c. Paris, 1791), instituted several experiments to ascertain whether butter really exists in the cream, and is merely separated by agitation, or by the act of churning, or whether this process effectuates a chemical change. They incline to the latter opinion; because they found that the separation of the particles of butter could not be produced in any other manner; cream left in the milk yields fat chees, but not butter. The oily parts do not rise into butter by exposure of cream to heat, nor by boiling it. The application of acids by separating the cheesy matter blended with the cream, instead of facilitating, retards the fermentation of butter. Half an ounce of oil was mixed with four ounces of cream; this was gently agitated and exposed to moderate heat; part of the oil swam on the surface, without uniting with the buttery particles in the cream; the other part rendered the fermentation of butter more difficult, and its confinement longer. Thus, whether solvents were applied to attach the buttery or cheesy particles of the cream, agitation was still necessary, and the change into butter was rendered more difficult.

Different methods are employed in obtaining and preparing this substance from milk as well as in managing and preserving it for use. See Dairying.

Butter, Whey, an inferior sort of butter made from whey in extensive cheese dairies. It is prepared in different methods in different dairy-disticts. See Dairying.

Butter, History of. The word butter is formed from βοτρέ-γος; a compound of βόσκω, cow, and νους, chafe; q. d. cow's chafe. Some authors, from a regard to this etymology, affect to write the word butyr and butyr. This is the etymology adopted by the Grecian and Roman authors. Chafe was known to them at a much earlier period than butter; and it is therefore possible, that, at first, they might have considered the latter as a kind of chafe, inasmuch that it appears that νους once signified any kind of coagulated substance. But to the first syllable of the word, it has been objected, that the Greeks used the milk of sheep and goats much earlier than cow's milk; and, for this reason, some have conjectured, that this first syllable was added, agreeably to the custom of the Greeks, in order to magnify the object, or to express a superior kind of chafe. Varro, de Re Rustica, II. 5. p. 274. Vigerus, de praecipuis Graeciae Dictionis Idiotismis, Lugd. Bot. 1684. p. 40. Others have supposed, that the name βοτρέγος is not originally Greek, but that it might have been introduced into Greece from some foreign country, together with the theory which it expresses. Accordingly, the term has been thought to be of Scythian extraction.

Butter, though commonly used at present in most parts of Europe, was not known, or very imperfectly known to the ancients. The ancient translators of the Hebrew writers, however, seem to have thought, that they found it mentioned in scripture, (Bochart Hierozoicon, II. 45. p. 475.) Accordingly, they have referred to the following passages: Gen. xxvii. 8. Deuterom. xxxiii. 14. Judges v. 25. 2 Sam. xix. 29. Job xx. 17. xxix. 6. Prov. xxx. 33. Isaiah vii. 15. 22. But biblical critics agree, that the word מָשָׁנָה, ebanah, signifies milk or cream, or four thick milk; and some of them who doubt or deny the early use of butter among the Eastern nations, will not allow that it denotes butter. See Michaelis Suppl. ad Lexic. Heb. pars. 1. p. 567. The word, it is said, plainly alludes to something that is liquid; and it appears, that ebanah was used for washing the feet, that it was drunk, and that it had the power of producing intoxication; and it is known, that mare's milk, when sour, will produce the like effect. It is further said, that we may conceive of streams of milk, but not streams of butter. The error has been ascribed to the LXX interpreters who have translated the Hebrew term by the word βότρέγος, butyrion. These translators who lived 200 years after Hippocrates, and who resided in Egypt, might, as Michaelis supposed, have been acquainted with butter, or have heard of it; but it is highly probable, that they meant cream, and not our usual butter. According to the common translation, indeed, it may be concluded, that the passage in Proverbs, ch. xxx, denotes the preparation of butter by shaking or beating; but the original words בְּנָוִים, ebanah metz, signify squeezing or pressing, frictio mulgentis, educt lac; so that milking and not making is supposed to be alluded to in this passage. It was late before the Greeks appear to have had any notion of butter. Homer, Theocritus, Euripides, and the other poets, make no mention of it; and yet they frequently speak of milk and cheese; nor does Aristotle, who has collected several curious particulars relating to the other two, say anything of butter. At first, indeed, he gives milk only two component parts, the watery and the caesous; and he remarks afterwards, for the first time, and in a place where it would be little expected, (Hist. Anim. III. 20. p. 388.) that in milk there is also a fat substance, which, under certain circumstanees, is like oil. Herodotus is the most ancient writer, who, in his account of the Scythians, (I. iv. 2.) particularly describes the process used among them for making butter; and this circumstance affords a preassumption, that butter was not then in use among the Greeks, and that they must have acquired it from the Scythians. The word βοτρέγος first occurs in Hippiocrites, (De Morbis, I. iv. ed. 1755. fol. 5. p.) where it is applied to milk, as both of them flourished in the 5th century before Christ. "The Scythians," says Hippiocrates, "pour the milk of their mares into wooden vessels, and shake it violently; this causeth it to foam, and the fat part, which is white, rising to the surface, becomes what is called butter, (ε βοτρέγος καθαρι.)" The heavy and thick part, which is below, being kneaded and perfectly prepared, is, after it has been dried, known by the name of hippieace. The whey or form remains in the middle.

In this passage the author speaks very distinctly of butter, cheese, and whey. Butter is often mentioned by Hippocrates, and he prefers it externally as a medicine under the appellation τιμνογεν, pikierion, which seems to have been in earlier use among the Greeks than the term βοτρέγος, or butter. In the time of Galen this term pikierion, which the Greeks seem to have borrowed from the Phrygians, had ceased to be in use; and it is not to be found in Hesychius, Suidas, or Polycin. The poet Anaxandrides, who lived soon after Hippocrates, (see Fab. Bib. Graec. i. 666. 742.) describing the wedding of Iphicrates, who married the daughter of Cotys, king of Thrace, and the Thracian entertainment given on that occasion, says, that the Thracians ate butter, which the Greeks at that time confided as a wonderful kind of food. Athenaei, Deipn. I. iv. p. 131, and Caestus, Anam. in Athen. I. iv. c. 3. p. 248. Strabo, in three passages (viz. l. 3. vol. i. p. 233. l. xxv. vol. ii. p. 1031, and l. xvi. vol. ii. p. 1176) refers to butter. In the former, he says, that the Lulitanians used butter instead of oil; and in the last he mentions the same circumstance respecting the Ethiopians, who, as Ludolfus informs us, (Hist. Zethop. I. iv. p. 14.) were acquainted with butter; and in the third Strabo relates, that elephants, when wounded, drank this liquid in order to make the darts fall from their bodies. The genuine
nels of this latter passage is doubted, as Aristotle, Pliny, and
\`Elian say that these animals used oil for this purpose. \`Elian, indeed,
(lib. xiii. c. 7.) says, that the Indians anointed the wounds of their elephants with butter. Plutarch, (Adversus Coloten, apud Op. t. ii. p. 1109. ed Xylander.) informs us, that a Spartan lady paid a visit to Beccinice, the wife of De-iotarus, and that the one smeared so much of ointment, and the other of butter, that neither of them could endure the other. Diocorides, about the year 53 B. C. (Mat. Med. ii. 81. p. 107.), says, that good butter was prepared from the fattened milk, such as that of sheep or goats, by shaking it in a vessel till the fat was separated; and he describes the same effects to it, when applied externally, as those produced by our butter at present. Diocorides is the first writer who observes, that fresh butter might be melted and poured over pulse and vegetables instead of oil, and that it might be employed in pastry in lieu of other fat substances. From him also we learn, that a kind of foot was prepared from butter, for external applications, and that it was used in curing inflammation of the eyes and other disorders. For this purpose the butter was put into a lamp, and, when consumed, the lamp was again filled, till the desired quantity of foot was collected in a vessel placed over it. Galen, who distinguishes and approves in a more accurate manner the healing virtues of butter, observes, that cow’s milk produces the fattened butter; that butter made from sheep’s or goats’ milk is less rich; and that the latter milk yields the poorest butter. He expresses his astonishment that Diocorides should say, that butter was made from the milk of sheep and goats; he affirms us, that he had seen it made from cow’s milk, and that he believes it had thence acquired its name. De Simple, Med. Facult. l. x. p. 151. ed Basil ii. p. 143. “Butter,” says he elsewhere (De Aliment. Facult. iii. cap. 15. p. 54. ed Basil. iv. p. 310.) may be very properly employed for ointments; and when leather is befmeared with it, the same purpose is answered as when it is rubbed over with oil. In cold countries, which do not produce oil, butter is used in the baths; and that it is a real fat may be readily perceived by its catching fire when poured over burning coals. From the circumstances above recited we may infer, that butter must have been very little known to, or used by, the Greeks and the Romans in the time of Galen, who wrote at Rome and lived at the end of the second century of the Christian era.

The Roman writers, who give an account of the ancient Germans, relate, that they lived principally on milk. Some say, that they used cheese, whilst others affirm that they were unacquainted with the method of preparing it. Strabo, (lib.iv. vol. i. p. 305.) speaking of the ancient Britons, says, that some of them were so ignorant, that though they had abundance of milk, they did not understand the art of making a cheese; but by his mode of expression he intimates, that they were not all equally unacquainted with this art. Pliny, on the other hand, says, (N. H. lib. xxviii. c. 9. § 35.) that the barbarous nations not only made cheese, but butter, which they used as a most pleasant kind of food, and that it distinguished the rich from the poor; and to them he ascribes the invention of it. By “barbarous nations,” this author most commonly means the Germans and Britons, because they were not thoroughly subjected to the Roman government, nor instructed in the Roman arts. He observes, that butter was commonly made from the cow, the fattest from the sheep, and that it was also made from goats’ milk; that in cold weather the milk was warmed, but that in summer this precaution was not necessary. The vessel employed for making it seems, from his description, to have resembled such as are now used; he says it was covered, and that in the lid there were holes. Whether Tacitus by “lac concertum,” (De Moriibus Germanorum, cap. 23.) which, according to him, was the most common food of the Germans, meant cheese or butter, is not easily determined.

From what has been above said it appears, that butter is not a Grecian, much less a Roman, invention; but that the Greeks were made acquainted with it by the Scythians, the Thracians, and the Phrygians, and the Romans by the people of Germany. It appears also, that when they had learned the art of making it, they employed it only as an ointment in their baths, and particularly in medicine. Columbus, (l. vi. 12. p. 592.) and not Pliny, is, as Vellius thinks, the first Latin writer, who makes use of the word “butter.” Pliny (l. xxviii. c. 19.) recommends it mixed with honey to be rubbed on children’s gums, in order to ease the pain of teething, and also for ulcers in the mouth. The Romans, in general, seem to have used butter for anointing the bodies of their children to render them pliable; and we are told by Sibyllus Apollinaris (carm. 12.) that the ancient Burgundians befmeared with it their hair with it. Clemens Alexandrinus (Peadag. l. ii. p. 107.) informs us, that the ancient Chryrians of Egypt burnt butter in the lamps at their altars instead of oil; and the Abydolians have retained a somewhat similar practice. It is certain, from the above detail, that butter was used neither by the Greeks nor Romans in cookery, or the preparation of food. It is never mentioned by Galen and others, as a food, though they have spoken of it as applicable to other purposes. No notice is taken of it by Apicius; nor is any thing said of it in that respect by the authors who treat on agriculture, though they have given particular information concerning milk, cheese, and oil. Indeed, the ancients had usually accustomed themselves to the use of good oil; and butter in later times has been very little employed in Italy, Spain, Portugal, and the Southern parts of France, where it has been sold in the shops of apothecaries for medicinal purposes. In warm countries it has been found difficult to preserve it for any length of time. In the Roman churches it was so far employed, during Christmas time, as to be used instead of oil, on account of the great consumption of it in other ways. Accordingly, in the cathedral of Rouen, there is a tower called “butter-tower,” tour du beurre, because George d’Amboise, archbishop of Rouen, in 1500, finding the oil fail in his diocese during Lent, permitted the use of butter, on condition that each inhabitant should pay six deniers for the liberty, with whichsum this tower was erected. There are other butter-towers at Notre Dame, Bourges, &c.

From the account of the method of making butter transmitted to us by the ancients, we have reason to suppose, that they were not acquainted with the art of making it so compact and firm as that of modern times; but it seems to have been in an oily, or almost liquid state. Butter is spoken of as somewhat fluid. The moderns cut, knead, and spread butter; but the ancients poured it out like oil; and it is represented by the Greek translators of the Scripture as flowing in streams. On this account the butter of the ancients would not be long kept or easily transported; and the use of it must have been very limited. See Beckmann’s Hist. of Inventions, vol. ii.

In different ages and nations various processes have been used for making butter. In Barbary, the effect of the operation, which we call “churning,” is produced by putting the cream into a goat’s skin turned inside out, which the Arabs suspend in their tents, and then press to and fro in one uniform direction. In this way they quickly occasion

---

**BUTTER.**
the necessary separation of the mucilaginous and wheyey parts. Shaw's Travels, p. 168. Dr. Chandler (Travels in Greece, p. 217.) took notice in his way from Athens to Corinth of another mode of churning practised in the Levant; which was that of treading on lumps of cream in order to separate the butter from its more watery part: and this practice, as some have supposed, under light on a pillow of Job (ch. xxix. 6.), that has hitherto been somewhat obscure. Hume's Observations, vol. iv. p. 172.

In Bengal, butter is easily made by the flight turning of a thick in milk; and when they would make butter past for fresh when it is old and rank, they melt it and poor upon it four curdly milk: some hours after which they strain it through a cloth for sale. For an account of other processes, relating to the making, curing, and preserving of butter, see Dairving.

Butter, in Commerce. The trade of butter is very considerable. The butter made in the county of Essex, and well known under the name of Epping butter, is that which is most highly esteemed in London and its vicinity. This appellation, in the more restricted use of it, is applied to that butter which is made from the milk of cows that feed during the summer months in Epping-forest, where the leaves and shrubbery plants contribute to improve its flavour. For the method of making this butter, see Dairving. It is made up for market in long rolls, weighing a pound each; and in the county of Somerset the same kind of butter is diffused in half-pounds for sale, rubbing half round the insides of the dill, so as to make it in the working appear hand-line. In many parts of the kingdom they colour their butter in winter; but by such means they do not enhance its goodness. It rarely happens that the farmers in or near Epping use any colour, and if they do, it is very innocent. They procure from the famed carrots, the juice of which they prefer through a sieve, and mix with the cream when it enters the churn, which makes it appear like May butter: nor do they at any time use much salt, though a little is absolutely necessary. The Cambridgeshire salt butter is held in the highest esteem, and is made nearly after the same method as that of Epping; and, by washing and working the salt from it, the cheesemongers in London often sell it, at a high price, for fresh butter. It is depository, when made, in wooden tubs or firkins, each containing 56 pounds, which are exposed to the air for two or three weeks, and often washed; but the most ready method of salting them is by the use of unslaked lime, or a large quantity of salt and water well boiled, with which they should be rubbed several times, and afterwards thrown into cold water, where they should remain three or four days, till they are wanted. They should then be rubbed as before, and well rinsed with cold water; but before they receive the butter, care must be taken to rub every part of the inside of the firkin with salt. Then, if the butter be properly made and perfectly sweet, it may be gently puffed into the firkin; but it must be well salted when it is made up, and the salt should be equally distributed through the whole mass, and a good handful of it be spread on the top of the firkin; after which the head should be immediately put on. They pursue nearly the same method in Suffolk and in Yorkshire; nor is the butter made in those countries much inferior to that made in Cambridgeshire; indeed, it is often sold in London for Cambridge butter. Uttoxeter in Staffordshire has been long a market famous for good butter, with which the London cheesemongers are supplied. It is bought by the pot, of a long, cylindrical form, weighing 14 pounds. The mountains of Wales, the highlands of Scotland, and the moors, commons, and heaths of England, produce excellent butter, under proper management; and though not equal in quantity, it is far superior in quality to that which is produced from the richest meadows.
